(iii) Selecting goals
(iv) Performance of employee
(v) Rewards/punishment as consequence of performance
(vi) Reassessment of deficiencies of need

The main function of governance is to formulate and implement public policies involving different institutions, actors, rules, regulations, and traditions. In governance system, there are heterogeneous actors within the organization and outside the organization. For instance, in local governance there are multidimensional actors like local government unit, NGOs, pressure group, interest group, social elite, politicians, media, and religious leaders. These actors can be divided into two types:

- Actors within the organization (Internal actors): Line and staff of the organization.
- Actors outside the organization (External actors): Political leaders, civil society, pressure groups, NGOs, media, local elites, etc.

Actors within the organization can be influenced through legal rational authority. Legal rational authority (also known as rational authority, Legal authority, rational domination, legal domination, or bureaucratic authority) is a form of leadership in which the authority of an organization or a ruling regime is largely tied to legal rationality, legal legitimacy, and bureaucracy. Actors within the organization (especially employees) are legally bounded to do the work. Internal actors will involve the process willingly or unwillingly. But he has to involve the governance process of the organization. The performance of internal actors depends on organizational motivational strategy. But the actors outside the organizations are not legally bound to do the best performance or even to do the work. It is the responsibility of governance to ensure the best performance of these external actors. The objective of governance is to involve both actors in policy formulation and policy implementation, i.e., governance wants to involve the actors. There are two stages of involvement

(i) Compulsive/formal involvement
(ii) Involvement with dedication and commitment

Compulsive or formal involvement indicates the involvement of actors within organization. Their involvement is must and they can be easily involved in the process of policy formulation and implementation. Internal actors are bound to involve the process because they are in a formal chain of command. But the level of dedication and commitment in policy formulation and implementation indicates their level of motivation.

Their level of motivation will clarify their level of involvement. The level of involvement of internal actors highly depends on level of motivation. Level of motivation depends on two things as well. Such as:

- Need Structure
- Availability of incentives to fulfill the need

External actors are not like internal actors. If the organization wants to involve the external actors in governance process, they may come forward or may not, because it is not mandatory for them to involve in the process of policy formulation and implementation. Although they involve, it is not clear that how much they will participate. The participation of external actors depends on their level of motivation. The motivation of external depends on his/her internal urge, drive, requirement, and needs. In this context, motivation is very important for the organization and actors. If the organization can motivate the external actors, they will obviously involve, because in this regard, motivational mechanism is much more important than formal invitation. And their level of involvement depends on their level of motivation and commitment.

On the basis of this involvement, various motivational theories emerged. It is important for the governance to understand motivation as a whole. For the reasons discussed hereinbefore, the contemporary theories relating to motivation ought to be revisited.

## Motivation Theories and Industrial Sector Governance

Motivation is inducing someone to do a piece of work efficiently and effectively. Many scholars have given different theories of motivation. These theories of motivation are basically given for the development of industrial sector governance. The scholars of public governance are applying these theories in public governance, though the mission and vision of the two governances are different. Industrial governance aims at making and enhancing profit whereas the target of public governance is public service delivery. The Motivation theories can be divided into two types. Such as:

**Content theories:** Content theories focus on the factors that energize, direct, sustain, and stop behavior of individuals. These theories explain "What" motivate an individual's to perform in a certain manner. Content theories include:

(i) Maslow's need hierarchy theory
(ii) McGregor's theory X and Y
(iii) Herzberg's two-factor theory
(iv) McClellan's theory of needs (Three need theory)
(v) Clayton Alderfer's ERG (existence, relatedness, and growth) theory (Clayton 1972).

**Process theories:** Process theories provide a description and analysis of "How" behavior of individuals is energized, directed, sustained, and stopped. Process theories include

(i) Victor Vroom's expectancy theory
(ii) J Stacy Adams' equity theory
(iii) B.F. Skinner's positive reinforcement theory
(iv) Edwin Locke's goal setting theory
(v) Porter & Lawler's performance satisfaction theory

## Content Theories

Human being is driven by need. When his/her needs are fulfilled he becomes motivated to perform well. Abraham Maslow identified five types of need hierarchically. Such as Physiological (the need for food, drink, shelter, and relief from pain), Safety and Security (the need for freedom from threat), Social (The need for friendship, affiliation, interaction, and love), Esteem (the need for self-esteem and for respect from others), Self-actualization (The need to fulfill oneself by maximizing the use of abilities, skills, and potential) (Maslow 1943, 1954). Fredric Herzberg identified two factors of motivation, i.e., hygiene factors and motivating factors (Herzberg 1959, 1987). The factors that prevent dissatisfaction are called hygiene factor. The important hygiene

factors are pay, quality of supervision, company policies, physical working conditions, and job security. The presence of these conditions to the satisfaction of the employee doesn't necessarily motivate him but their absence results in dissatisfaction. On the other hand, motivating factors make the employees to perform well. The important motivating factors are promotional opportunities, opportunities for personal growth, recognition, and achievement. The absence of these conditions doesn't prove highly dissatisfying. But when these are present, they build strong levels of motivation that result in good job performance. Douglas McGregor identified that the people inherently dislike work and try to avoid it. This type of employee needs to be controlled and threatened with punishment (Theory X). On the other hand, works are natural and the employees do the work with enthusiasm and commitment (Theory Y). According to McClelland's theory of need, there are three needs of human being like need for achievement, need for power, and need for affiliation which motivates employees to perform well (McClelland 1961, 1975).

## Process Theories

Process theories explain how individuals are motivated to their work. According to expectancy theory, the strength of a tendency to act in a certain way depends on the strength of an expectation that the act will be followed by a given outcome and on the attractiveness of that outcome to the individual (Victor Vroom 2000). There are three relationship of expectation theory like effort-performance relationship, performance-reward relationship, and reward personnel goals relationship. Equity theory explains that individuals compare their job inputs and outcomes with those of others and then respond to eliminate any inequalities. Justice (distributive and procedural) can motive people to perform in an efficient and effective manner. Goal-setting theory of motivation is also important because it deals with feedbacks that lead to higher performance of the individuals. Goal commitment, adequate self-efficacy, task characteristics, and national culture are vital factors of influencing goal-performance.

## Use of These Theories in Public Governance

In the age of NPM (New Public Management), public administration follows the market mechanism for service delivery. NPM popularized the jargon steering not rowing. According to this theory, government is in the mind of competition with private sectors. Though the theories of motivation are given by the private sector, the public sector is using these theories for motivating its employees. The important point to be noted here is that the aim of both sectors is different. Private sectors motivate their employees for more profit but the public sectors motivate their employees for better service delivery.

## Need for Comprehensive Motivation Approach

A comprehensive model of motivation is the crying need for the public sector. Ensuring good governance can motivate the public sector employees to delivery better service to the citizens. The value premises of contemporary motivation theories are profit making, but the value premises of public sector is service delivery. The employees of public sector can be ensured through ensuring participation, accountability, transparency, and rule of law.

## Conclusion

Motivation is an important issue of governance. To run the administration smoothly, all the actors of governance should be incorporated. Incorporation of the actors depends on the level of motivation. The motivation of internal actors is crucial because they formulate the public policies with their technical knowledge and implement that

policy for the development of the country. If the motivational factors are absent, they will not give their best effort. Bad performance of internal actors will push the administration into bad governance. On the other hand, participation is an important element of good governance. Participation of external actors makes the public policies more effective. The participation of external actors depends on the level of motivation made by the governance. Consequently, it can be claimed that motivation and governance are intertwined. By ignoring the factors of motivation, it is difficult for the administration to be more efficient and effective.

# Motivation and Leadership

Shuyang Peng
School of Public Administration, University of New Mexico, Albuquerque, NM, USA

## Introduction

Motivation and leadership are two evergreen topics in management studies. In public management, Behn (1995, p. 315) considered "how public managers can motivate people… to work energetically and intelligently towards achieving public purpose," one of the three big questions that needs to be answered. The purpose of this chapter is, through introducing theories of motivation and leadership, to show how leaders shape three types of motivation: individual motivation, public service motivation, and organizational collective motivation.

## Leadership and Individual Motivation

Individual motivation is actually a series of factors that drive an individuals' behavior. Motivation can be viewed as either intrinsic or extrinsic. Intrinsic motivation is doing something that is inherently enjoyable and satisfying, whereas extrinsic motivation relies on external

factors such as obtaining rewards or avoiding punishment. In general, people are more motivated by internal gratification than external factors. In organization settings, individual motivation is often examined as work motivation, which reflects the psychological processes that direct, energize, and persist work behaviors (Kanfer 1990).

The following discussion of a leader's influence on individual motivation is mainly drawn from classic motivation and leadership theories. In particular, motivation theories such as needs theory, goal-setting theory, operant conditioning theory, cognitive evaluation theory, participation theory, and job characteristics theory are explained. Leadership theories such as power theory, path-goal theory, participation theory, and transformational and transactional leadership theory are also discussed.

## Leadership and the Needs of Individuals

The need-fulfillment paradigm of motivation theory posits that a person is motivated by their desire to fulfill certain needs. The most famous needs theory goes back to Maslow's hierarchy of needs. According to Maslow (1943), there are five basic human needs: physiological needs, safety needs, love needs, esteem needs, and self-actualization. These needs can be arranged into an ascending sequence based on their relative prepotency. Basically, it means that human needs come in a hierarchical order; only when a person's lower-order needs are satisfied will they pursue higher-order needs.

Needs theory later underwent modifications and expansions suggested by other scholars. Aldefer (1972), for instance, reformulated five levels of needs into three levels, which include existence needs, need for relatedness, and need for growth. In his book *Human Motivation*, McClellan (1985) suggested that people are driven by three types of needs: the need for achievement, the need for power, and the need for affiliation. Different needs drive people to behave differently. For example, people driven by the need for achievement may prefer and perform better at relatively difficult tasks. Needs theory provides considerable insights for leadership behavior, as it suggests that a leader can motivate employees by identifying and satisfying their unique needs.

## Leadership and Goal Setting

The basic premise of goal-setting theory (Locke and Latham 1990) is that goals guide behaviors. When a person sets goals, they have a clearer sense of direction, they tend to direct and increase their efforts toward achieving goals, and they are more likely to strategize new ways of accomplishing their goals (Locke and Latham 1990). According to the theory, three factors are crucial in determining whether a person will achieve their goals. The first factor is goal commitment. People are more likely to achieve goals that they are deeply committed to. Goal commitment is particularly important when goals are specific and difficult. However, a person's goal commitment is influenced both by how much they value the outcome of the goal and their beliefs about their capabilities for successfully accomplishing goals (i.e., self-efficacies). The second factor is feedback, which shows the progress en route to goal achievement. The third critical factor is task difficulty. When a person sets a complex goal, they direct more and longer efforts toward the goal, and they are more likely to achieve the goal.

Based on goal-setting theory, leaders can help employees to set goals and leverage these goals into a source of employee's work motivation. For instance, a leader can enhance an employee's goal commitment by communicating the importance and the values of the established goal and by strengthening an employee's belief that they can achieve the goal. Providing timely and constructive feedback about an employee's performance and progress is also an important motivator. Complex tasks can be introduced from time to time as a means to challenge and motivate employees.

## Leadership and Rewards

Motivation theory has paid considerable attention to how rewards can be used to motivate individual behavior. Operant conditioning theory (Skinner 1953) is such an example. The theory posits that human behavior is guided by its consequences. According to the theory, three main approaches – reinforcement, punishment, and extinction – can therefore be used to control behaviors. Reinforcement can be positive that strengthens behavior by providing rewards. It can also be negative that strengthens behavior by removing an unpleasant stimulus. Punishment is used to prevent unwanted behavior from occurring again. And extinction of behavior occurs when behavior is no longer reinforced by the same consequence.

Although research on operant conditioning has established reward as an effective behavior stimulus, another stream of research has offered a different view. This stream of research, known as cognitive evaluation theory (Deci 1971; Deci and Ryan 1980), examines the undermining effects of external rewards on intrinsic motivation. The theory posits that behaviors are not always contingent upon external rewards but originate from within. A person may perform certain activities in the absence of external rewards because these activities are inherently enjoyable. But in situations where a person is given external rewards, such as a financial bonus, to perform tasks that they enjoy, they tend to put in less effort than in situations where there are no mediated rewards.

This decrease in intrinsic motivation, according to Deci and colleagues, is triggered by the provision of extrinsic rewards that causes locus of causality shifting from internal to external. That is, when extrinsic rewards are offered, one loses a sense of self-determination as the rewards become the controlling agent of one's behavior. The intrinsic motivation is thus undermined. Yet the theory also suggests that the type of reward matters. If intangible rewards such as verbal compliments and feedback are given instead, these rewards can in fact strengthen intrinsic motivation.

Leadership theory also includes discussions of the power of leaders in mediating rewards. The power theory of leadership identifies five types of power bases (French and Raven 1959) that a leader can use to induce certain psychological changes in a subordinate. These five power bases are reward power (i.e., the extent to which a leader has the ability to reward a subordinate), coercive power (i.e., the extent to which a leader has the ability to punish a subordinate), legitimate power (i.e., the extent to which a leader has the legitimate power over a subordinate), referent power (i.e., the extent to which a subordinate identifies with a leader), and expert power (i.e., a leader's level of expertise). Overall, the different types of power employed by a leader would result in varying motivational states of a subordinate.

In public administration, scholars have long questioned the effectiveness of using financial incentives, particularly pay-for-performance programs, in rewarding and motivating public employees. The main argument is that a public sector management and compensation system does not have the flexibility and resources needed to ensure the success of pay-for-performance program (Ingraham 1993). Even those public managers with adequate resources at their disposal may find that providing financial incentives is not a good idea as it may crowd out an employee's intrinsic motivation. Thus, to motivate employees in public sector, it may be more effective for leaders to use nonmonetary incentives such as communicating the importance of public service and providing feedback on work impacts.

## Path-Goal Leadership and Motivation

Path-goal leadership theory explains how leaders can effectively shape a subordinate's motivation. The theorization of path-goal leadership was built on the expectancy theory of motivation.

Expectancy theory was first developed by Vroom (1964) and later expanded by others (e.g., Porter and Lawler 1968). In general, the theory posits that individual motivation is a function of three key factors: (1) expectancy, one's

expectation that making an effort will result in a certain level of performance; (2) instrumentality, one's estimate that a given level of performance will secure certain outcomes or rewards; and (3) valance, how much one wants such an outcome or reward. In other words, a person is more motivated when their efforts will result in a level of performance that they can see will result in an outcome they actually care about.

Building on expectancy theory, path-goal leadership theory emphasizes that leaders can effectively shape a subordinate's motivation by directing their actions to managing these three motivational factors. Specifically, according to House (1971), the essential role of leaders is to ensure a subordinate sees two connections: a clear connection between work efforts and work-goal achievement and a clear connection between work-goal achievement and the rewards that the subordinate values.

To show a subordinate that their hard work will lead to certain goal achievement, a leader needs to clarify the subordinate's responsibility and help to enhance their capabilities in performing tasks. A leader also needs to remove those obstacles that stand in the way of obtaining results. In order to reassure a subordinate that performance will lead to certain valued outcomes, a leader needs to clearly communicate the possible rewards associated with work accomplishments and consistently mediate those rewards. The rewards can be in the form of extrinsic rewards such as higher compensation or promotion or in the form of intrinsic rewards such as a sense of satisfaction and personal growth.

Path-goal theory (House and Mitchell 1974) proposes four types of leadership behavior: directive, supportive, participative, and achievement-oriented and also suggests that an effective leadership style is contingent upon two sets of factors: subordinate characteristics and environmental factors. For example, directive leader behavior may improve a subordinate's satisfaction when tasks and policies are ambiguous because it will help to clarify those tasks and provide guidance. Supportive leadership, in contrast, works well when a subordinate works on stressful or frustrating tasks.

## Participative Leadership and Motivation

Both motivation and leadership theories have recognized the importance of participation. Participative leadership involves a leader encouraging and facilitating employee participation in decision-making. Yukl (2010) aligned four types of participation on a continuum. No participation is on the left and high participation is on the right. Therefore, an autocratic decision, appearing on the extreme left end of the continuum, allows for no participation. Consultation, second from the left, allows some degree of participation such as when a manager asks for an opinion, but the decision is still left entirely to the manager. Moving rightward again, the next type is the joint decision. A joint decision allows for more participation, as managers and participants have equal influence, they discuss and make the decision together. Delegation, on the far right end, gives the decision-making power to others. Managers may give some guidance and may or may not give final approval. Yukl (2010) acknowledged that decision procedures in practice do not necessarily fall neatly into these exact categories. In many cases, different types of decision call for different decision-making procedures.

Nevertheless, participative leadership can provide a number of motivational benefits for employees. According to Lawler (1986), participation in a decision can affect motivation in several ways. To begin with, participation fulfills an employee's need for control, competence, achievement, and personal growth; by fulfilling these needs, an employee's motivation could be increased.

Participation also provides opportunities for an employee to be part of a goal-setting process and to commit to established goals. When an employee sets goals and becomes committed to those goals, they tend to be motivated to achieve the goal. In addition, participation allows an employee to make decisions about how to perform tasks and allows them to obtain feedback about progress and performance. These factors, according to job characteristics theory discussed later in the chapter, are essential in increasing an employee's intrinsic motivation.

## Leader-Member Exchange and Motivation

Derived from role theory and social exchange theory, leader-member exchange (LMX) theory was developed by Graen and colleagues (e.g., Dansereau et al. 1975). The theory focuses on the exchange relationship between leaders and their subordinates. According to the theory, leaders develop different relationships with their subordinates, which range from high-quality relationships to low-quality relationships. A high-quality relationship is characterized by high trust, interaction, support, and rewards, whereas a low-quality relationship is characterized by low trust, interaction, support, and rewards (Dienesch and Liden 1986).

Dansereau et al. (1975) pointed out, in high-quality LMX, leaders often provide subordinates with trust, emotional support, rewards, and work-related privileges such as information, autonomy, and interesting and important tasks. In exchange, subordinates reciprocate with hard work, trust, and loyalty. Because a subordinate often derives various intrinsic and extrinsic rewards from such an exchange relationship, they tend to develop a positive motivational state.

## Transformational Leadership and Motivation

Transformational leadership was first introduced by James MacGregor Burns (1978) in his seminal book, *Leadership*. In this book, Burns drew a distinction between transformational leadership and transactional leadership. Transformational leadership, according to Burns (1978, p. 56), occurs "when one or more persons engage with others in such a way that leaders and followers raise one another to higher levels of motivation and morality."

Building on Burns' work, Bass (1985) conceptualized four components of transformational leadership. The first component, idealized influence, refers to the extent to which leaders serve as role models for the followers. The next component, inspirational motivation, describes the extent to which leaders inspire and motivate followers in pursuit of higher goals and missions. The third component, intellectual stimulation, emphasizes the extent to which leaders stimulate followers intellectually by questioning assumptions and encouraging followers to challenge the status quo and make changes. The final component, individual consideration, identifies the extent to which leaders are attentive to their followers' individual needs and growth.

In both Burns and Bass's conceptualizations, transformational leadership is motivational. Using Maslow's hierarchy of needs as an illustration, Burns (1978) suggested that transformational leaders do recognize followers' basic needs. But, more importantly, they encourage followers to move up the hierarchy of needs toward a higher level of self-realization. Bass (1985) also stated that transformational leaders help followers to transcend their self-interest for the collective good of the group, organization, or country. Although Bass (1985) did not consider ascending to the next level of needs as a necessary condition for the occurrence of a transformational process, he did point out that the transformational process usually involves the upgrading of needs.

Besides the direct motivational effects of transformational leadership, there are other key mechanisms, through which transformational leaders shape a follower's motivation. The first mechanism is empowerment (Bass and Riggio 2006). Empowering followers is an important characteristic of transformational leadership. Some examples of leadership behaviors that empower followers are delegating authority and responsibility, encouraging independent thinking, and increasing work autonomy. When a follower feels a sense of empowerment, their motivation will increase.

The second mechanism is self-concept (Shamir et al. 1993). Self-concept, in general, refers to how an individual views and defines himself/herself. It is comprised of values and identities that function as the main source of motivation of individual behavior. Transformational leaders can motivate

followers by activating and shaping those values and identities that are embedded in a follower's self-concept. For instance, if a leader aims to improve a follower's work motivation, they can increase the salience of the identity associated with work in the follower's self-concept, which in turn increases the likelihood of a follower's behaviors reflecting such identity (Shamir et al. 1993).

The third mechanism is self-concordance (Bono and Judge 2003). The self-concordance model of motivation suggests that an individual is autonomously motivated when they pursue goals that align with their internal interests and values. Transformational leaders thus play an essential role in presenting organizational and work goals in terms of values that are endorsed by followers' internal value systems. Once a follower believes that the organization's goal and their work goals are congruent with their internal interests and values, they tend to perform better and be in a more positive motivational state (Bono and Judge 2003).

The fourth mechanism is job characteristics. Job characteristics theory (Hackman and Oldham 1976) posits that when a job is designed to reflect five essential characteristics, it creates the condition for a high level of employee work motivation (Hackman 1980). These five job characteristics are (1) skill variety (the extent to which the job requires a variety of skills to carry out the work), (2) task identity (the extent to which the job requires a completion of identifiable work with visible outcomes), (3) task significance (the extent to which the job has significant impact on other people's lives), (4) autonomy (the extent to which individuals have freedom and discretion in carrying out the work), and (5) feedback (the extent to which individuals will obtain information about their performance). Transformational leaders can communicate information cues that can influence a follower's perceptions toward their job (Piccolo and Colquitt 2006). For instance, a leader can articulate the importance of the work or provide timely feedback to followers to help them identify problems and improve performance.

## Transactional Leadership and Motivation

Unlike transformational leaders who concentrate on follower development, transactional leaders engage followers in social exchange relationships. Instead of motivating followers through empowerment and through appealing to values and identities, Bass (1995) suggested that transactional leaders depend on two tools to manage and motivate followers. The first is the contingent reward, such as a financial bonus. The second is management by exception, meaning leaders passively waiting for mistakes to occur and only intervening when there is a problem. Both of these tools rely on external factors such as reward and punishment to motivate subordinates.

## Leadership and Public Service Motivation

In public administration, scholars are particularly interested in public service motivation (PSM). PSM can be broadly defined as the "motives associated with serving public good" (Perry and Hondeghem 2008, p. 3). According to Perry and Wise (1990), PSM has three motivational bases. Rational motives explain why some individuals gravitate toward public service because of their interest in policy making and advocacy. Norm-based motives involve an individual's desire to serve the public interest and social equity as well as a sense of duty and loyalty to government service. Affective motives describe an individual's patriotism of benevolence.

Leadership plays an important role in motivating employees to engage in public service behaviors. Transformational leadership, as a value-based leadership, is particularly influential. Paarlberg and Lavigna (2010) pointed out several

key management practices that transformational leaders can utilize to foster an employee's PSM.

First, transformational leaders need to articulate and communicate inspirational ideology and the importance of public service values to employees. By doing this, they can inspire employees to go beyond their self-interest to pursue the greater good. Second, transformational leaders can work to foster an alignment between an employee's values and the values of the organization. Such alignment can be achieved by recruiting employees who are responsive to public service values before entering public service and by arranging socialization programs that cultivate public service values. Third, by setting clear public service goals and by communicating the meaning of these goals, transformational leaders can motivate employees to increase their efforts toward goal accomplishment. Fourth, transformational leaders need to show employees a clear connection in terms of how their work has contributed to organizational success and clients' well-being. Knowing their work has an impact can reinforce an employee's beliefs in public service. Fifth, it is important for transformational leaders to create an organizational environment that allows autonomy and flexibility, because autonomy enables employees to accomplish public service goals via actions that they deem appropriate. Lastly, it is not enough for transformational leaders to only preach the correct ideas and values; more importantly, a transformational leader needs to walk the talk by setting an example through their own actions.

## Leadership and Organizational Collective Motivation

There are three key ways through which leaders shape organizational collective motivation. The first way is creating an organizational culture within which there are shared beliefs and values among employees. Organizational culture determines how employees behave, interact with each other, and carry out tasks in an organization. When leaders build a strong organizational culture, it produces a shared commitment among employees toward certain values or goals, which in turn can help to prescribe desired behavior patterns.

The second way is fostering a collective organizational identity. Identity is an important source of motivation. When employees have a shared identity in relation to the organization, they are collectively motivated to behave in a way that reflects that identity. In public organizations, public service identity is perhaps the most salient shared identity among employees. A public service identity forms when an employee embraces and internalizes public service values. Leaders can facilitate this value internalization process by collectively communicating a compelling vision of public service and celebrating an employee's progress in achieving this vision (Yukl 2010).

The third way is augmenting the collective efficacy of employees. Collective efficacy refers to the collective belief that together employees can successfully carry out an organization's goals and mission. It also means the optimism and confidence that employees have in the ability of top leaders to guide the organization to success (Yukl 2010). As collective efficacy may lead to heightened collective motivation, leaders need to find ways to increase such collective efficacy. To this end, Yukl (2010) prescribed several leadership behaviors such as making inspiring speeches, explaining solutions to overcome obstacles or deal with crises, keeping members informed about progress, and celebrating achievements.

## Conclusion

In summary, theories assert that leadership plays a vital role in shaping individual motivation, public service motivation, and organizational collective motivation. To heighten individual motivation, leaders can adopt different strategies depending on the situation. For example, some strategies that

focus on employee development include fulfilling employees' personal needs, enhancing their self-efficacy, and empowering them. Some other strategies that are associated with work include facilitating the work goal-setting process, designing jobs that are interesting and important, augmenting work autonomy, emphasizing intrinsic rewards that employees can derive from work, and providing timely and constructive work feedback to employees.

A leader can also foster an employee's public service motivation. A leader can focus on inspiring the employee to transcend their self-interest for the public good, creating value congruence between the employee and the organization, and facilitating the employee's internalization of public service values as the employee's public service identity is being formed. To increase organizational collective motivation, a leader can create a work culture based on shared beliefs and values, foster a collective identification with the organization, and enhance the collective efficacy of public employees.

# Motivation Theory and Practice in Public Employment

Trenton J. Davis
Department of Public and Nonprofit Studies, Georgia Southern University, Statesboro, GA, USA

## Synonyms

Employee motivators; Incentives and rewards; Work motivation

## Definition

Motivation is the behavioral drives one experiences in relation to satisfying some types of perceived need or needs (Gabris and Davis 2016).

## Introduction

Motivation is an "umbrella concept that captures the psychological forces that direct, energize, and maintain action" (Grant 2008, p. 50). While each theory of motivation incorporates its own distinct set of concepts and propositions, there is an underlying commonality of meaning from which a general definition of motivation can be derived. Broadly defined, motivation is the behavioral drives one experiences in relation to satisfying some type of perceived need (Gabris and Davis 2016). For example, if managers find themselves behind in writing a report that is due shortly, the need or goal is to finish the report. This, in turn, motivates or drives them to work longer hours in order to achieve the goal. If not done, the unfinished report will remain a nagging issue causing stress and discomfort. Thus, they are motivated to increase the time to resolve the disequilibrium. This definition captures the core rationale embedded in most theories of motivation. Namely, individuals engage in driven behavior (action choices) as a means for addressing one or more felt needs. However, the motivation process is complicated when employees experience competing and even contradictory needs. To address these complexities, different motivation theories developed nuances and logic concerning the forces that energize, direct, and sustain behavior.

## Public Service Motivation

Theories and assumptions about what motivates public employees are important, as they guide the development of the systems and strategies that organizations use to drive behavior. In the public sector, research has shown that individuals find meaning in their work by making a positive difference in the lives of the citizens they serve. The idea that serving the public is an honorable and noble pursuit is not new. For example, in his description of the servant leader, Robert Greenleaf (1970) made the case that the servant ethic could make a substantial difference in the overall quality of society.

In a now classic article addressing the motivational basis of public service, Perry and Wise (1990, p. 368) defined public service motivation (PSM) as "an individual's predisposition to respond to motives grounded primarily or uniquely in public institutions or organizations." They postulated three primary motives associated with an individual's choice to engage in public service. First, individuals may be attracted to public service for rationally motivated reasons. For example, by working for a public agency, some may see this as a means by which to pursue policy preferences in a direct, operational context. Others may exhibit normative motives for working in public service. Here, individuals may pursue public policies they believe are ethically correct, such as advancing more environmentally friendly measures. Third, individuals may pursue public service work for affective reasons in the context of having strong emotional ties to the public service; for instance, some may be drawn to the public sector because of family tradition.

Since that earlier work, Perry (2000) has developed a more comprehensive description of PSM. In his view, the key to formalizing a theory of PSM involves an individual's sociological

context, which may include family, educational, religious, and professional training – factors that combine to influence broader institutions. These institutions reinforce our emerging self-concept and provide a set of self-regulatory processes. It is self-concept that influences individual behavior regarding the career one aspires to, the kinds of rules one chooses to follow, and the types of obligations and commitments one holds toward one's job.

It should be understood that PSM does not literally mean public *sector* motivation. The construct pertains to anyone, even in the private sector, who responds to motives traditionally associated with public institutions. Nonetheless, it can be assumed that individuals planning to enter public sector careers are also likely to display normal to above normal PSM scores. These individuals have self-selected themselves for jobs in which they are expected to serve the public both directly and indirectly; it is reasonable to assume that they will display substantive levels of PSM.

## Trends in Public Administration Theory and Practice

There has been considerable debate and research devoted to understanding where PSM derives from and the role it plays within public organizations. While the empirical research focusing on PSM has been generally supportive (Wright 2008), several trends in contemporary public administration have emerged that complicate and challenge the value of the PSM construct. This does not mean that PSM does not exist or is without intrinsic value, but rather there is a tangled disconnect between the ideals of PSM and the public service reality present in the twenty-first century.

In earlier parlance, government administration was described as most effective when it was detached, objective, and separate from political policy making (Wilson 1887). Public managers were career professionals chosen on the criterion of merit, who provided the specialized expertise necessary for implementing public policy efficiently (Goodsell 2004). These professional public managers ostensibly adhered to codes of ethics that stressed honesty, integrity, duty to the public good, and removal of conflicts of interest (Banovetz 1971). The job of professional public managers was to run government organizations as well-oiled machines, based on widely accepted principles of management (Gulick 1937). Contemporary scholars have criticized the dichotomy model as overly simplistic and flawed, arguing that public administrators and policy officials often share certain roles and responsibilities (Svara 1990). Yet, the image of the public manager as a dedicated, highly trained, and skilled individual who enjoys substantial esteem in his or her profession, coupled with a sense of pride in serving the public, has largely remained a positive ideal-type.

In a conceptually evocative essay, Bowman (2009) argued that the private sector ideology has gained such enormous momentum and become so ingrained in our mindset that it has led to a situation where no one questions whether the benefits of the "private sector is better" ideology are antithetical to public sector ends. Quoting Paul Light, Bowman (2009, p. 331) averred, "We have no data to show that contractors are actually more efficient than government." Yet, the tendency to contract out to the private sector has proliferated, in effect creating a shadow government of private contractors. The implication for many aspiring and current public service professionals is that their primary job becomes that of contract monitor; they no longer do the job themselves but delegate the work to the private sector.

This diminution of public service has been further exacerbated by a principal-agent approach in terms of how organizations perceive and treat their workers. Agency theory holds that most workers do not like their jobs and given the opportunity will engage in moral hazard and shirk their responsibilities (Zajac 1995). Using information asymmetry to their advantage, employees will game the system. As a consequence, public sector organizations frequently implement mechanisms designed to closely monitor employee performance to thwart shirking behavior and keep employees focused on the goals of the organization (Tosi and Gomez-Mejia 1989).

Finally, while many public organizations espouse teamwork and cooperation, they also seek to control the behavior and performance of their employees (Gabris 1998). Elected officials often do not seem to trust public employees to perform well unless they are subjected to strict and often severe rules of accountability and control. Command and control management dovetails nicely with bureaucratic organizational design, which remains the predominant model of public organization structure.

## Emerging Public Management Models

Perry et al. (2006) identified numerous emerging trends associated with how public organizations are being managed. Perry et al. (2006, p. 89) contended, "Sweeping contextual changes surrounding the way the public's business is conducted suggest a renewed need to visit the drivers of human performance in the public sector." The authors posited 13 separate propositions regarding the expectations of future public service employees. These propositions can be summarized in the following manner: Employees will be expected to function within highly integrated team-based management systems, where group or unit output takes precedence over individual performance. Consequently, incentive systems that reward group performance are more likely to become dominant, where output expectations are linked to difficult but achievable goals. Such team-based management systems will place a high value on individual commitment to group goals, facilitated by much broader job descriptions, where employees will be expected to master multiple skills and tasks. Moreover, employees will be expected to participate in team decision processes and take ownership of team performance. Output will be carefully measured and assessed to ascertain goal completion, as well as to assess the effectiveness of the larger organization. In sum, these new public organizations will have flatter hierarchies, less functional specialization, greater reliance on strategic decision-making, and less attachment to traditional top-down authority systems.

With respect to motivation theory and practice in public employment, there are two conceptually distinct models of public management contending for dominance. The first model is economically derivative, portraying public employees as a type of tool to be used in accomplishing public goals, with the caveat that such employees are likely to pursue their own private interests when given a chance to do so. This model also portrays traditional government service provision as largely ineffective and generally inferior to the private sector in terms of carrying out complex tasks. The second model assumes that public organizations are capable of addressing highly complex problems successfully. This model is based on high trust, commitment, group incentives, authority decentralization, and broad job descriptions. Here, the public sector is viewed much more as a potential solution, rather than automatically subrogated as the problem.

## Theories of Motivation

While studies have shown that public employees rank service to the community more highly than personal gain, individuals are motivated in a myriad of ways (Le Grand 2006). Needham, Mangan, and Dickinson (2014, p. 6) noted that "better understanding the bundle of incentives that motivate people to serve the public is part of the workforce challenge for 21st Century public services." With regards to work motivation, there are two main determinants of human behavior – intrinsic motivators and extrinsic motivators. Intrinsic motivators or rewards are derived from the job itself, such as having challenging job tasks, developing new forms of job knowledge, or the sense of duty that one feels as a public employee. Extrinsic motivators or rewards are part of the job situation that is provided by others. They include, for example, salary and benefits, opportunities for advancement, and job security. Research has consistently demonstrated that public employees, due to recruitment, self-selection, and socialization, are more likely to derive motivation through intrinsic rewards than their private sector counterparts (Houston 2006). Public

employees, however, are not motivated by altruism alone. Mulgan (2009) noted that thresholds matter. In other words, public employees are altruistic up to a point and then require other types of motivators and rewards to sustain altruism.

As noted above, motivation can be defined as the drive individuals experience to satisfy perceived need deficiencies. While it is intrinsic and extrinsic motivators, or some combination thereof, that drive behavior, theories of motivation can be sorted into two distinct categories – content theories of motivation and process theories of motivation.

### Content Theories of Motivation

Content theories of motivation attempt to explain *what* drives individuals to engage in goal directed behavior (Hellriegel et al. 1986). That is, content theories refer to the various needs, motives, and rewards attempting to be satisfied. For example, money constitutes an extrinsic motivator because it can be easily converted into tangible, externally useful things that drive motivation, whereas self-esteem serves as an intrinsic motivator that can satisfy individual internal needs for self-meaning.

The "hierarchy of needs" model developed by Abraham Maslow (1943) is a classic content theory of motivation. Maslow argued that humans must first satisfy basic physiological needs, such as hunger and thirst before moving on to more complex needs, such as esteem and self-actualization. These latter needs involve higher psychological states that are more intrinsic than extrinsic. ERG Theory, proposed by Clayton Alderfer (1972), sought to simplify Maslow's construct by reducing the five need levels to three more general levels: existence needs, relatedness needs, and growth needs. Existence needs represent lower order needs, whereas growth needs fall into the highest need category. Individuals progress up the hierarchy one step at a time as a need is satisfied. When both lower order and higher order needs are unmet, an individual will be motivated to direct their effort toward satisfying the lower order need first. When an individual is unable to fulfill a growth need, he or she will regress to lower order need states as their primary motive focal point.

Other notable content motivation theories include the motivation-hygiene theory of Frederick Herzberg (with Mausner and Snyderman 1959), and the achievement theory of David McClelland (1961). Motivation-hygiene theory posits that two distinct factors separate extrinsic and intrinsic motive forces, and that only intrinsic factors truly motivate people. Workers expect *hygiene factors* such as pay, equipment, and working conditions to be adequate for carrying out their jobs. If these factors fall below expectations, they serve to dissatisfy workers; however, once improved, they do not serve as primary motivators. Alternatively, intrinsic motivators such as achievement, recognition, autonomy, the work itself, and responsibility appeal to one's higher psychological needs.

McClelland's (1961) achievement theory is based on the Thematic Apperception Test (TAT). According to McClelland, individuals vary in their need for achievement, affiliation, and power. Achievement motivation is perhaps most crucial for job performance. Achievers prefer to set their own goals and tend to avoid extremes by taking on difficult but achievable tasks. Additionally, achievers prefer tasks that provide more, rather than less feedback (Hellriegel et al. 1986). Individuals with a strong need for affiliation typically seek approval and reassurance from others. They are also characterized by a desire to conform to the wishes and norms of others. Individuals with a strong need for power seek to control their environment. They seek to exercise influence and aspire to positions of leadership.

### Process Theories of Motivation

A more sophisticated approach to motivation involves process theories. Process theories of motivation focus on the cognitive and behavioral processes that drive motivation. Put another way, process motivation theories explore *how* different motivational forces (both extrinsic and intrinsic) interact in ways that motivate individuals. Theories

falling into this category include expectancy theory (Vroom 1964), equity theory (Adams 1965), and goal setting theory (Locke 1968).

Expectancy theory is premised on the belief that individuals undertake a conscious decision-making process when deciding whether and how to act. The decision to act is based on three sets of perceptions. First, individuals must believe that their behavior is related or will lead to certain outcomes (rewards). This is known as the performance-outcome expectancy. Second, individuals place different values on outcomes. Third, individuals change or alter their behavior based on the perceived probability of success. This is known as the effort-performance expectancy. For example, employees seeking a raise (outcome) may alter their work ethic (behavior). However, if employees do not believe that a raise is obtainable or the employee is simply not motivated by monetary rewards, then they are likely to remain unmotivated. Thus, the expectancy process would entail altering both the way an individual's performance is measured, as well as the reward system itself (Gabris and Davis 2016).

Equity theory (or social comparison theory) entails an exchange relationship between an employer and employee. In an effort to drive motivation, the employer provides one or more outcomes including salary and benefits, promotions, and praise. In turn, the employee provides inputs in the form of his or her job performance. Employees compare their input to outcome ratio against other employees (known as comparison others) both within and outside the organization. When employees perceive a balance between the inputs provided and outcomes received, they will likely be satisfied with the exchange relationship. However, employees may feel under-rewarded if they perceive that the ratio of their inputs is less than the ratio of outcomes to inputs for others. This is known as underpayment inequity. Though rarely the case, it is possible for an employee to feel over-rewarded if the perceived ratio of inputs is greater than the ratio of outcomes to inputs for others. This is known as overpayment inequity. A perceived inequity creates an internal state of tension that will motivate employees to reduce by altering or adjusting their inputs accordingly.

Goal setting theory makes several important assumptions regarding how goals motivate people. First, goals should be difficult but achievable. If a goal is perceived as too difficult, achieving it may be attributed more to luck than skill. Similarly, if a goal is seen as too easy then skill is still not a factor. It is when goals balance skill with extraordinary effort that they convey a sense of genuine achievement. Second, goals should be proximate rather than distal. Individuals must perceive that by exerting effort a goal can be achieved quickly, rather than years later. Third, specific goals are more motivational than broad, abstract goals. A final component concerning goal setting theory is that goals should not be viewed as static. Since goals are based on the past as well as some predictions about the future, it may become necessary to alter goals as the circumstances surrounding those goals change.

## Conclusion

The range of practical management activities where motivation theory may be utilized is vast. These strategies include job redesign (Hackman and Oldham 1980), semi-autonomous work teams (Lawler 1992), skill-based pay (Thompson and Lehew 2000), gainsharing (Graham-Moore and Ross 1995), and non-monetary incentives (Allen and Helms 2002). For a detailed summary of each motivational strategy and their applicability to public organizations, see Gabris and Davis (2016). The challenge for public organizations and managers is both to discover and employ the appropriate mix of intrinsic and extrinsic motivators that will drive the behavior of individuals. Complicating matters are the emergent models of public management that depict two very different pictures of today's public service. One model conceives public organizations as more of a problem than a solution, whereas in the second model

public service is viewed much more favorably. Given that many individuals pursue public employment due to a predisposition to serve the public in some capacity, the conflicting nature of the organizational landscape creates challenges about how to best motivate the current and future generation of public employees.

## Synonyms

Education reforms, public sector reforms; Institutional requirements, government controls; Motivation, incentive; Rewards, recognition

## Definition

Public sector reforms involve changes that have been made to the public sector since the 1980s in order to improve performance.

Private training establishments are government-sanctioned education providers in New Zealand who are structured on the private company model.

Research and publication refers to a requirement of academic staff to remain research-active so that their quality of teaching and the reputation of the organization that employs them are up to par with sector standards.

## Introduction

Research and publication has traditionally been part of general expectations attached to the role of an academic even though for a long time it was believed that delivering lectures (teaching) and coordinating courses (administration) were the primary requirements. This usually meant that even if one engaged in minimal research and publication, a healthy teaching/administration output was sufficient to ensure career progress. All this changed with the public sector reform process that swept through New Zealand after 1984. Reforms in the education sector from 1989 onwards involved a staggered minimization and attempted total removal of direct government funding with a concomitant prescriptive reliance on self-funding and competitive entrepreneurship among education providers. This meant that competition had to be encouraged through an unprecedented removal of institutional barriers to entry into the sector. As the business potential of the sector became increasingly visible, there was a proliferation of private as well as public providers. This was followed by a gradual realization that the deregulation focus of the initial stages of reforms had compromised standards in the output produced by especially the private training establishments (PTEs) who were structured on the private company model (Appanna and Goundar, 2011). This led to a process of re-regulation that appears to recognize the need for a cost-profit focus in providers, but continues to develop innovative policy frameworks that have a quality-integrity focus.

It is within this institutional framework that structures and requirements are enforced via periodic audits and reviews. One of the institutional requirements placed on providers is to encourage research and publication among staff. Preliminary research revealed that, as with most external demands placed by the New Zealand Qualifications Authority (NZQA), providers were constantly attempting to "beat rather than meet" the system. This was particularly pronounced among New Zealand's more than 600 PTEs who appeared to see virtually every externally imposed requirement as an unnecessary cost. Encouraging staff to research and publish via internal support structures appears to, therefore, have become a characteristic shortcoming among PTEs. This research attempted not only to establish this for a fact but to identify and analyze how these support structures actually operate and how improvements could be made so that the expectations of all the stakeholders in PTEs – owners included – are met in the manner expected. It contends that, given the nature of the industry and its pecuniary potential, a total reliance on internal mechanisms to motivate and encourage research among staff might not be enough for various reasons. The paper concludes that the "beating rather than meeting" requirements approach not only has a detrimental effect on staff research, but it fosters a culture of mediocrity in staff performance that ultimately

damages the institution in a number of ways. This research should, therefore, be highly useful to all stakeholders in the education sector.

## Methodology

This study was developed after an animated weekend discussion that at times bordered on argument, among a number of academics and bureaucrats who were keen on ensuring that the research tradition is kept alive in New Zealand regardless of whether the academic works at a PTE, polytechnic, or university. The research draws extensively on the not-inconsiderable experience of two of the researchers both in the university and PTE sectors. For wider enquiry, corroborative data, and methodological robustness, a total of 11 academics with varying backgrounds – 6 from the PTE studied, 3 academic/administrators, and 2 government bureaucrats – were involved in a series of semiformal, in-depth discussions for the initial part of the research. This was supplemented by a follow-up communication for clarification and verification purposes. In a twist to the methodology chosen, findings almost inevitably ended up being discussed later, *talanoa* style, within mixed portions of the same group on five different occasions in informal settings. What appears here, therefore, had wide consensus among the groups involved. These findings, rather than being conclusive, should serve as a platform for industry-wide research on the topic of motivation for research and publication among academics.

## Overview of the New Zealand Education Sector

New Zealand's Education Act was introduced in 1989, and it was around 1999/2000 that foreign student numbers jumped to 50,026 before hitting a record of 126,919 in 2002 (Ministry of Education 2005). New Zealand's Ministry of Education website stated that "[f]rom 1999 to 2003, New Zealand's previously small international education sector, that is, in terms of enrolments of foreign fee-paying students, experienced rapid growth" (Ministry of Education 2005, p. 4). By 2016, this number had climbed to 125,425 declining to 118,300 in 2017 (Ministry of Education 2018).

A significant portion of students come from China which is the number one source of foreign students in New Zealand, while Indian student numbers showed remarkable increases. International education is New Zealand's fourth largest export industry generating some $5.1b worth of income in 2017–2018 accounting for 1.6% of the country's GDP. This was forecast to rise to 8 million students by 2025 (Education New Zealand 2018). International education also provides employment for over 47,000 citizens each year (Education New Zealand 2018). More importantly for the purposes of this paper, the increase in foreign student numbers after liberalization of the education sector has continued to attract considerable entrepreneurial activity leading to a proliferation of private providers as well as innovative new offerings from existing institutions in the public sector. At present, New Zealand has 1909 tertiary education providers: 153 PTEs, 18 polytechnics, 37 industry training organizations (ITOs), 8 universities, 3 wānanga-based providers, and a number of more narrowly based institutions. The bulk of applications to the NZQA for new course/program approvals emanates from the largely profit-driven PTE segment. PTEs are "private organizations providing education/training (i.e. they are not state-owned)." Their portfolio includes English language training as well as offerings towards academic certificates, diplomas, and degrees at various levels. More importantly, PTEs are the fastest-growing segment among education/training providers in New Zealand.

## Education Policy in New Zealand

Education providers operate within a national policy framework that attempts to ensure that output standards remain roughly the same among the three sets of providers outlined here. The policy framework incorporates a strategic dimension by

saying that current policy aims to build "a world-leading education system that equips all (students) with the knowledge, skills and values to be successful citizens in the twenty-first century" (Ministry of Education 2009, p. 6). Furthermore, the focus of quality assurance in New Zealand falls on the "quality of learning outcomes recognized through qualifications as a whole" as well as the "systems and processes that support quality delivery by providers". It is this latter portion that covers staff involved in the sector. Not only are staff supposed to be adequately qualified to teach at matched levels within the organization, but they are also expected to keep abreast of knowledge development in their respective disciplines by actively engaging in research or research-related activities. Governments' Performance Based Research Fund (PBRF) is aimed at recognizing, rewarding, and encouraging quality research in the education sector. In 2009, PBRF funding had reached $239m, a 45% increase over a 5-year time period with the figure set to match any improvements in research output in the country. This had risen to $300m by 2016 (https://web.archive.org/web/20130512032624/http://www.tec.govt.nz/Documents/Reports%20and%20other%20documents/PBRF-Assessment-Interim-Report-2012.pdf). This initiative is targeted at encouraging providers to hire, develop, retain, and encourage research-savvy and research-motivated academic staff as once a staff member attains PBRF ranking, his/her employer becomes eligible to obtain substantial government financial input to help fuel the research focus further.

## Motivation for the Academic

Earlier studies on motivation saw it as the force energizing or giving direction to behavior; this focus was later expanded to view it as a complex interaction of behaviors, needs, rewards, reinforcements, and cognitive activities (Nkomo et al. 2005). Looking at the motivational profile of an academic from a needs perspective, it would appear that the need to retain one's job and make career progress would be firmly entrenched in the performance appraisal system of the employer – two key elements are usually seen in appraisals of academics: teaching/administration and research/publication. Furthermore, the need to belong and grow usually further encourages research till it becomes cultural and acquires a volition of its own within the organization. A new entrant to this environment would then be pulled into the culture via an acquired need to be accepted and belong in the research-focused environment. Further motivation would come from rewards both expected and unexpected. These include a range of things that fuel the drive to engage in and persist with research and publication. Robson (2004) identified the following as factors that motivate present-day people to work: contributing to corporate success, inspiring boss, sense of loyalty to the company, management praise, peer group respect, incentives, promotion prospects, getting paid, team spirit, and challenging projects.

These work in interesting ways with the academic. Firstly, the academic seeks recognition – both internal and external – through his/her research. This recognition has a number of dimensions. The research gets outside recognition through either a conference invitation or publication or both. The usual path for a budding academic or one who is trying to forge a breakthrough in a new/different area of research is to take it through a conference process and then submit it for possible publication. Further external recognition then follows with invitations to conferences, to review papers and to contribute articles/chapters for publication. Internal recognition, on the other hand, comes from heightened respect from colleagues and management, promotions, salary increments, support for further research, etc. The added respect could also lead to helping build a spirit/culture of research in the organization. This, of course, would need top management commitment and support, and preferably either active leadership by management or a delegated leadership in the absence of an active research profile among management. Another element that drives research in academics is if they are given challenging projects, with clearly linked rewards, and have the direct eyes of management on their performance. This provides them with an opportunity to "shine" in order to gain recognition

from the "top." Unfortunately, in the PTE studied, there were major shortcomings including the type of management, quality of staff, and culture that prevailed in the organization. The following sections focus on these.

## What Happens in PTEs?

Most private training establishments (PTEs) are relative newcomers in the field of education. By their very nature, they are profit-/cost-focused and operate as legally established private companies. This tends to have a flow-on effect on all functional decisions regarding personnel as well those decisions that impact on staff and organizational performance. A typical PTE has a number of structures and practices specifically dedicated to encouraging research and development among staff. The fact that these are institutionally prescribed requirements, which are seen to negatively impact the performance bottom line, tends to create space for a policy-practice divide which can be exploited to the detriment of both the organization and the individual. The ensuing section outlines and discusses some of the key structures and practices involved.

**Staff**: Staff recruitment has two dimensions in a PTE: the recruitment of administrators and that of academics. Top management is institutionally required to comprise personnel with academic and/or academic administration backgrounds. This stipulation, often found problematic, is aimed at ensuring the academic focus of PTEs and content of qualifications attained so that they match roughly the output from other players in the sector – polytechnics and universities. PTEs in New Zealand, however, face difficulties in attracting high-profile personnel for these management positions for a number of reasons. First, remuneration packages offered are not attractive enough. Second, there is virtually no opportunity to progress further in the field making the job a dead-end position. Third, public profiles are hardly enhanced by joining PTEs. Thus, top management positions tend to attract personnel who are not necessarily expecting any further career progress. This tends to have a number of flow-on effects in the organization. For example, top managers find themselves left out of decision-making as soon as processes become standardized. They thus oppose (sometimes inadvertently) any and every attempt that is made at increasing standardization and routinization. This almost automatically leads to a tendency towards micromanagement which suffocates innovation, ownership, problem-solving, continuous improvement, and esteem and self-actualization among subordinate staff.

Top managers' psychological insecurity and need to be involved also have a more insidious and heavily damaging impact on staff motivation and performance. Very often staff initiative becomes "joint enterprise" and, therefore, makes it extremely difficult to identify original effort in order to directly allocate rewards. Conversely, failures of "joint enterprise" can easily lead to accountability being placed solely on the employee without any responsibility taken by the manager involved. This not only discourages initiative among subordinates but also makes them fear treading "too far" even though their initiatives could help greatly in improving organizational performance. Drucker (2006, p. 57) says that in a "traditional workforce, the worker serves the system; in a knowledge workforce, the system must serve the worker" and help unleash his/her full potential. This is hardly likely in an environment where top management often appear to be afraid of being "shown up" if workers are allowed to unleash their full potential.

The problems highlighted in the recruitment of top managers are also prevalent in attracting other workers, especially academic staff. It is not uncommon for PTEs to hire a large proportion of academic staff from among contacts and networks on a part-time basis. This leaves a smaller portion of full-time positions for academic staff. Furthermore, the institutionally required need to have a public profile through its staff is largely served by the part-time component leaving the PTE free to recruit full-time staff who are willing to join at comparatively unattractive (and cheaper) salary packages. They are also usually immigrants who

are more desperate to get a job as soon as possible in order to sustain their lives in a new country. These recruits are more likely to be subjective, less questioning, and less demanding at least in the first few years of employment. From the perspective of the equity theory of motivation, they are more likely to compare their salaries and work conditions with what they left behind rather than with what they could have (Greenberg 2010). This creates a workforce that is comparatively less qualified, more questionably qualified, and less conversant with the intricacies of research and publication. It is not uncommon, for instance, to come across staff who ask: "do we need to research?" "how can we decide what to research?" "what is a peer-reviewed source?" These are just some of the queries identified during the course of research for this paper. They do show emphatically not only a lack of research background but a total lack of appreciation of the need for academic staff to engage in research and publication. Any immediate expectation of research from these staff is, therefore, overly ambitious. Moreover, attempts to encourage research are seen as impositions and resented in secret.

The situation is not helped when those attempting to lead the research drive do not have the right profile. Drucker's contention (2006, p. 57) that what "makes (an academic provider) a great (academic provider) is that it attracts and develops outstanding teachers and scholars" is, therefore, not part of the workings or culture of the PTE studied. The cost-profit focus appears to loom too large in managerial decision-making stunting any attempts to encourage research with a major motivation-focused push in order to develop a long-term agenda that would help reap rewards well beyond the costs outlaid as is seen in learning organizations. Thus, developing a research culture becomes a lost proposition even though it is clearly recognized that "the key to greatness is to look for people's potential and spend time developing it" (Drucker 2006, p. 59). This moves focus to self-motivated research among staff who may be considering making career progress in the sector despite encountering an element of "stagnation" in their current jobs.

**Recognition for research and publication**: In the absence of any concerted and cohesive, long-term focused, ongoing program aimed at developing a research culture, a small number of staff are known to be research-active in the PTE studied. Recognition and support for their effort is clearly facilitated through existing structures. Academic staff are allowed to "free up" 1 day in the 5-day work week to dedicate to conducting research. This appears to assume that staff are research savvy and the organization has a thriving research culture. Both of these assumptions do not stand up to scrutiny as seen from earlier discussions. A major source of recognition for research comes through the PTE progress and promotion apparatus. Here, there are clear policy (as well as staff contract) stipulations about recognition for research output. In reality however, the commonly escalating problem of the policy-practice divide is abused with impunity by management who do not seem to actually respect and cherish research and publication as one of the key roles/outputs of a typical tertiary education provider. It is not uncommon for innovative interpretations to be made of these policy stipulations in order to decline applications for accelerated increments and/or promotions. In one case, an applicant with six pieces of research output was refused promotion because the term "research output" was interpreted differently in what appeared like an obvious attempt to frustrate and deny the applicant.

Another source of encouragement that could be used to drive research in the organization is through support for attending and participating at academic conferences as per convention in the tertiary education sector. The PTE in question, once again, has clear provisions for this. In practice, however, the same reluctance is seen. In one case, an eager new researcher completed a paper and got it accepted for a conference in Germany. In refusing to support her request for the policy-stipulated funding, she was told to send her paper to a local conference within New Zealand – no attempt was made to actually direct her to a local conference as there were none available at the time. Despite this obviously shattering turndown,

2 years later she submitted another application for support to present a paper at a conference in Malaysia. This time the organization stated there were no funds available due to reduced student numbers (profits). No prior organization-wide announcement had been made on the issue up till then. This has ominous implications for both the research philosophy at play and the manner in which organizational structures are being used to boost research and publication – there are obvious motivational implications involved. A key structure in this regard is the research committee which is also to a large extent forcibly established in PTEs through institutional requirements.

**Research committees**: Chaired by a senior academic in the form of the academic head of the institution, the research committee (RC) is set up to spearhead and manage research in an academic institution. Other members of the committee are supposed to comprise senior personnel preferably with a research and publications profile. The research committee is tasked with ensuring that staff are encouraged to undertake research through a series of activities and support structures that ensure that, over time, research, development, and publication become part of the culture of the organization. These research committee activities are clearly designed to motivate and encourage staff to actively engage in research and publication so that tertiary education providers are able to establish, retain, develop, and enhance their academic focus and reputation.

A misguided understanding of the significance and role of research, however, tends to divert the role of research committees in PTEs into becoming a problem and obstacle to research rather than operating as an instrument of encouragement. The research committee covered here repeatedly obstructed attempts by the one junior staff who managed to write and get a paper accepted at an international conference as cited earlier. In another case, a senior researcher and member of the research committee decided to intensify his research with a view to attracting funds to the institution via the PBRF system that was due within 2 years. He wrote full papers that were accepted at three conferences in the first year and four in the second year; all were peer-reviewed and published either in conference proceedings or in linked journals. The research committee supported all these, but agreed to pay for only three conferences. The rest were either paid for by the researcher himself or he managed to obtain external funding.

During discussions on the third conference application, it was pointed out that the existing policy did not preclude anyone from applying for support for more than one conference per year provided requirements, as laid out in the application form, were adequately met and a certain number of points were amassed by the applicant. In fact, the existing system had in-built mechanisms to help process subsequent applications through the allocation of fewer points. To this the Chair responded, "the policy was meant to support research, not to allow a second or third bite . . ." This, despite the fact that the researcher had a full paper and scored a "strong" on the points, system is used to evaluate applications. A closer analysis of the Chair's words appears to be damning of the philosophy and orientation of the PTE in question on the issue of research and publication. He is clearly unhappy to support "too many" conferences by one researcher. In other words, researchers at the institution should limit their research output to one per year if they were targeting conferences. This was an extremely unhelpful message for other members of the organization interested in research. How would this help motivate further research? Moreover, would the PTE ever be able to create "star" researchers in the mold envisaged by the PBRF system? More ominously, this appeared like an attempt to "mediocritize" the researcher who was obviously stretching the prevailing expectation system. Drucker (2006) says that the knowledge workforce is characterized by the fact that workers are no longer simply labor as in the traditional workforce, but they are capital. "And what is decisive in the performance of capital is not what (it) costs . . . Not how much (of it) is being invested (but what's) the productivity of capital" (Drucker 2006, p. 58). In this case, clearly output and

productivity had become subordinated to the stated cost concerns.

There was a further development in the deliberations being analyzed here as it was pointed out that "conference visits are not necessary to publish." This, again, was an extremely counterproductive stance vis-à-vis research because conference visits have a number of positive effects on/for the researcher as well as the organization. These include exposure at an international academic conference; impact on PBRF rating if the paper has been accepted for peer-reviewed publication; impact on research/publications profile internationally; publicity for the PTE and its marketing implications; inspiration to other staff within an environment that actively attempts to encourage academic research; networking for publication and involvement with conference circuits and linked publications; personal development of staff; and the PTE's commitment to research and publication. All these have both direct and indirect motivational implications. Moreover, it is a well-known fact that conference participation markedly enhances the chances of a paper being accepted for publication – this being the expected ultimate aim of both the researcher and the academic employer. Was this a case of simple bad management or a sign of merely incidental regard for research and publication? Was the organization not concerned about enhancing its public reputation and attracting the not-insubstantial funding on offer through the PBRF system? This brings us to the next point.

**PBRF system**: New Zealand established its Performance Based Research Fund system in 2003 "to ensure that excellent research in the tertiary education sector is encouraged and rewarded" (Tertiary Education Commission 2020, http://www.researchfunding.co.nz/pbrf.php). A total of some $300m is disbursed per year to tertiary education providers who meet the set requirements and are able to show an acceptable level of research output. This money is supposed to be used by the provider to further fuel research activity and attempt to improve its status as well as public reputation. Most universities actively promote the fact that they are PBRF rated in order to attract students. The Tertiary Education Commission (TEC) and government expect providers to show their research commitment by allocating funds to research-related activities. They are also required to show how they utilize PBRF allocations if they are able to attract these. Discussions revealed that provider commitment is seen through the amount of internal funds that they allocate and use for research-related activities. It has been found in a number of instances involving PTEs that they do not allocate enough internal funds to research. Earlier cases outlined in this paper appear to show that this is also a problem with the PTE covered here. There is also no transparency in the use of PBRF funds, something that would have helped the institution better make its case about "lack of funds" for research support. In the absence of this, staff de-motivation and speculation became rife especially after trips were supported for selected members after funds were frozen. This does not make for a healthy organizational culture, let alone research culture.

## Conclusions

This study showed that there are a number of key motivational dimensions in the "publish or perish" dictum. Academic staff who engage in research activities expect recognition and rewards that have internal as well as external sources. In PTEs, external recognition does not pose any costs; in fact, it can easily lead to rewards via attraction of PBRF funding. It is with internal recognition that the question of costs arises. This is where visionary management could easily lead to the creation of a research culture that turns initial costs into an inflow of funds in excess of the costs outlaid. If the organization were to fully support three capable and active researchers to conferences over a period of 3 years, this would very likely lead to enough publications and research outputs to attract $60,000 per year of PBRF funding over a 5-year period. On the other hand, if the research effort were to be led by top management in the form of five managers having

"research output" as one of their key performance indicators (KPIs), substantial PBRF funding would again flow in without too much effort. This, however, does not happen in the PTE studied. Not only are top managers research-dormant, they appear to be curiously unsupportive of individual initiatives in research as seen with the cases discussed. The cost-profit mindset also does not help and clouds the research equation.

There are a number of things that PTEs need to do to come out of the dismal research rut that they find themselves in. Firstly, they need to attract managers who are not only research supportive but also research-active. They need to firmly believe in the need for research in academic providers. Secondly, PTEs need to attract and/or develop staff who are either research savvy, research-active or are positively inclined towards research. This will provide an immediate impetus to the research drive. Thirdly, the structures that are prescriptively put in place to ensure that PTEs do not lose their academic hue need to be used correctly so that they deliver expected outcomes. Attempts must be made to ensure that staff progress structures are closely linked to and provide further motivation for research. Furthermore, research committees must be used to encourage research and ensure recognition is given where it is due rather than to suppress the research spirit and, over time, suffocate the flame that drives it. Lastly, PBRF (if attracted) must be clearly used to enhance research in the organization and not to reward non-research endeavors. To this end, external audits need to itemize this as a point of inquiry as it involves government funds. These are just some of the research-related motivation factors that have been identified in the course of this research. A wider research in the PTE sector involving a larger number of PTEs should help greatly in enhancing the quality of these findings.

## Synonyms

Incentives

## Definition

Incentives, stimuli, influences, or drives that make people work (or not work), or to undertake other actions.

## Introduction

Theories of organization can ignore neither markets nor motivations. While organizations are common in both the public and nonprofit sector, their origin was in markets. Markets dominate the options available for earning money, and money motivates people to work. Money also motivates the formation of organizations. Williamson (1981) argued that rational agents use organizations to manage tasks when individuals working independently cannot accomplish the task at a lower cost. In this case, an individual (the principal) hires and pays someone else (agent(s)) to help do a task so that the principal profits. But hiring an agent may be risky, especially when tasks are complex or unclear or when the principal fears the agent may know more than the principal. Individuals can contract out complex tasks, but contracting is risky and possibly costlier than hiring an agent who works directly for the principal in an organization (Coase 1937).

Contracting also has high transaction costs, especially when the desired outcome is hard to monitor or when the production process is specific to the organization. Asset specificity means that generic practice is not applicable or available (Williamson 1981). Further, the contractor may have different motives than the principal. In these cases, in-house supply may be cheaper than contracting with a supplier (Klein 1988, 2000; Freeland 2000). In-house production still needs organization, and organization requires some degree of hierarchy to coordinate and control who does what and when. In these cases, hierarchy can be more efficient than either contracting or marketing of individual actors.

The argument that organizations persist in markets because they are more efficient than other alternatives is usually based on the assumption of profit-maximizing actors. The principal wants profit, and the agent wants money in exchange for the opportunity cost of his labor. Lone producers in a market also work for profit. This essay reviews theories that examine other motives for work in organizations or markets.

Money has a time value (Halperin 1986). For workers, there are always other things, besides working for pay, that they could do with their time. Further, when a resource (e.g., time or money) is scarce, the first unit of consumption is far more valuable than the last. Usually, people who have a lot of money have little time; and people who have a lot of time have little money. The first group may be motivated more by the promise of extra time than by extra money; the second group is likely to be motivated more by the promise of extra money, and they are willing to give up time (since they have a lot of it) in exchange for working for additional money.

The theory of diminishing marginal value applies to more than money and time (Horowitz et al. 2007). Even eating pizza has diminishing marginal value: the first slice is far more pleasurable (i.e., adds more to "utility") than the fourth slice. However, this essay focuses on the diminishing marginal value of money. Money is critically important, since it can be converted into many other goods: food, shelter, and even used to make more money.

The role of money in a market economy is undeniable: money makes exchanges much cheaper, reducing transactions costs. Without money, exchanges would be bartered, meaning that buyers and sellers exchange goods or services, rather than money. The seller must find someone else who both wants his pig and is willing to trade his cow for the pig. Or he could find an intermediary who trades a goat in exchange for his pig, and then he finds someone else willing to trade the goat for the cow. With money, the seller can sell the pig to anyone who is willing to buy it at a price that at least covers his costs. The seller uses the money to buy a cow, or anything else. Thus, money has value for both buyers (the principals) and sellers (the agents) and for principals (the buyers) and agents (the seller), reducing the transaction cost of trade for both sides.

## The (Diminishing) Marginal Value of Money

But other things besides money have value and that resource is "monetized" by time: there are only 24 hours in day. Some of that time will be used for making money. Those who make only a small amount of money per unit of time will probably use most of their time making money: since money is scarce, every additional dollar is useful to purchase other scarce items. Those who make a lot of money at work often find that additional time spent at work making even more money would be better spent if the additional time were used for other things that have become scarce. Some of that time will be used for personal enjoyment. However, it is also possible to work (make money) and gain pleasure at the same time. This means that, sometimes, if you are working at a task you enjoy, you are less likely to be attracted by an offer of slightly higher pay to do a task that you enjoy less.

There are many forms of intrinsic preferences that lead employees to forgo wages, especially when time is scarce, in favor of doing what they like to do anyway. For example, some employees value vacation time, or the ability occasionally to work at home, and they may be willing to forgo additional pay in exchange for these nonmonetary benefits. There is also evidence that the possibility of symbolic awards (e.g., recognition at a special ceremony) elicits more effort than monetary pay alone (Kosfeld and Neckermann 2011; Kube et al. 2012).

Because money is likely to be particularly valued by low-wage workers, symbolic or intrinsic awards will not help to attract the most productive among this set of workers. When wages are low, and output is easy to measure, higher wages will induce more work: not only will current workers try to be more productive so they can keep their jobs; the more productive workers will replace less productive workers. Pay for performance does exactly what it says (Lazear 1996).

However, since money has diminishing marginal value, it is not inevitable that high-wage workers will work harder for more money. In fact, if everything, including money, has diminishing marginal utility (Horowitz et al. 2007), the expectation is that performance pay is likely to work best for lower-wage workers. Happily, lower-wage work is also likely to produce outputs (or even outcomes) that are measureable by performance pay. Measuring the outcomes of teaching is far more difficult than measuring the outcome of working in a school cafeteria or for an auto window glass manufacturer (Lazear 1996). However, work that is easy to monitor is exactly the kind of work that can be contracted to an outside supplier: there is neither asset specificity nor information asymmetry between the principal and the agent, and performance contracting will reduce the incentive of the agent to shirk.

By contrast, high-wage ("white collar") work is often asset specific; the outcome is hard to measure; and the pay may be quite generous. Instead of performance pay, which is risky, particularly when the outcome is hard to measure, nonmonetary rewards may induce and reinforce qualitatively better performance. Monetary rewards, often based on simple, noisy, and possibly biased indicators of outcomes, may have additional hidden costs. The measured outcome may not be the intended outcome, and the necessity for comparing one employee's performance to another may induce resentment and noncooperative competition rather than cooperation and better outcomes for the organization.

## Nonmonetary Motives for Work: Public Service

In a competitive labor market, and since margins matter, particularly among higher-paid workers, those who get paid to do what they want to do anyway may even accept a lower wage, relative to similar workers who have no particular personal preference for the work assignment (Rainey 1983). One example is "public service motivation." Public service motivation is one form of intrinsic motivation that is likely to be unique to public service employees, many of whom are white-collar workers. For example, some people love the outdoors: they often wind up in biology, geology, hydrology, etc. and work for

corresponding public or nonprofit agencies. Others are concerned about poverty, and, similarly, wind up working in corresponding public agencies.

Not everyone in these agencies is motivated by public service. It is likely that monetary performance rewards are valued most by those who are (a) lower paid, (b) generally less satisfied or committed to their organization, or (c) not meaningfully motivated by public service. It is also likely that performance rewards work in other ways to motivate workers. For example, performance pay conveys important information to workers highlighting (a) what the organization values are and (b) how managers evaluate employee performance. Jointly, these factors may help focus employees' time, attention, and motivation in those specific directions desired by senior management. Similarly, performance-related pay may be especially important to workers who attach significant weight to their personal reputation or who hope to advance up an organization's hierarchy.

Nevertheless, everything has margins: low-paid workers with high public service motivation may value monetary bonuses, rather than more autonomy or voice in directing their own work. The money margin still has value, but marginal values decrease as the quantity of the resource increase. Thus, the higher-paid worker, who has little time, may place more value on intrinsic rewards, which include voice in directing their own work, recognition, or public service activity, compared to monetary rewards, before he or she looks elsewhere for work.

Public service motivation is particularly common in public (and nonprofit) organizations (Perry and Wise 1990), and it may partly explain why public service pay is often observed to be less in the public sector than it is for comparable jobs in the private sector. But it is also the case that public services are asset specific, so that many public sector jobs are not directly comparable to seemingly similar, private sector jobs. Thus, the very asset specificity of public employment makes public service motivation likely to be an important component of the reward structure among many professional (and some blue collar) public employees. For example, a social worker may be willing to work for a public (or nonprofit) organization for less money than a comparably trained professional who works for a large corporation in the personnel department.

Public service motivation scholarship seemingly validates this assertion (although little research exists supporting its importance among blue-collar workers). For example, research indicates that public sector employees who are capable of fulfilling their altruistic motives are more likely to (a) exhibit prosocial and organizational citizenship behaviors, (b) be satisfied with their jobs and committed to their organizations, and (c) perform at reasonably high levels (see, e.g., Pandey and Stazyk 2008). Further, such findings have often been replicated internationally (mostly in industrialized countries).

## Other Theories of Work Motivation

Nevertheless, some researchers question the theoretical merits and practical utility of pitting public service motivation – a collectivist approach – against individualist (incentive-based) models. Such a separation may not even exist: people gain personal utility from altruistic behavior. In addition, other theories provide insight into additional factors that drive motivation.

Two of the most prominent motivation theories are self-determination and goal-setting theories. The former focuses on the extent to which an individual's choices and actions are self-determined and self-motivated. Unlike many other theories, self-determination theory accounts for the joint importance of extrinsic and intrinsic motivation and assumes motivation is guided by three overarching psychological needs: autonomy (ability to self-direct), relatedness (interactions with others), and competency (mastery of a task) (Ryan and Deci 2000). The latter – goal-setting theory – suggests goals and the process of setting goals can enhance or diminish motivation. For goals to motivate workers, they must be (1) specific and clear, (2) difficult but attainable, (3) communicated to workers, (4) viewed as legitimate by employees, and (5) supported by managers

(Locke and Latham 2006). Consequently, goals that are set by the manager in conjunction with an employee typically produce higher levels of goal commitment and are more likely to be viewed as realistic and attainable by the employee. Notably, some researchers have suggested the efficacy of performance-related pay schemes is contingent on the extent to which they reflect the logic inherent in goal-setting theory (Milkovich and Wigdor 1991).

Despite any differences between them, a primary implication of both self-determination and goal-setting theories is the notion that work can be designed in ways that will either enhance or inhibit employee motivation. This assumption enjoys long-standing support in management scholarship and has informed motivational approaches since Frederick Taylor urged organizations to adapt piece-wage systems and to follow "scientifically" determined best practices (Grant 2007; Hackman and Oldham 1976; Taylor 1911).

Perhaps the strongest formalizations of the job design assumption are contained in job characteristics theory, which demonstrates how certain key job characteristics (e.g., task significance and feedback) affect employees' work experiences, and, in turn, employees' work-related attitudes and behaviors, including motivation, satisfaction, absenteeism, turnover, and performance (e.g., Hackman and Oldham 1976). The goal is to design jobs that increase the meaningfulness of work for employees, which should then have positive spillover effects such as enhanced employee motivation. However, the application of job design techniques cannot easily be separated from an organization's size, core tasks, and objectives. Organizations that are highly bureaucratic, either by choice or because their primary objectives necessitate it, may find it more difficult than small, decentralized organizations to be flexible in structuring jobs and tasks.

Equally as important as the structural aspects of one's work environment are employees' perceptions of their work and their experiences with colleagues. We know, for instance, that employees constantly make assessments about the likelihood that their efforts will translate into valued or preferred outcomes (e.g., expectancy theory) (Vroom 1964). If workers think additional effort is unlikely to result in a desired outcome, they often adjust their level of engagement downward; the converse also seems to be true. Likewise, employees will adjust their work-related contributions based on whether they believe they are being treated fairly (Adams 1963). An employee who believes he is rewarded unfairly relative to a coworker reduces his contributions. Conversely, the employee who is underperforming but highly compensated relative to her colleagues may increase her contributions.

Social interactions and experiences are also highly relevant to employee motivation. Not only do such interactions frequently "teach" workers about an organization's culture and norms, but several emerging streams of scholarship also seem to indicate that social exchanges between workers often drive or inhibit motivation and performance. For example, workers may be more inclined to view feedback or even a leader as legitimate and worthy of following if the employee and leader are of the same background (e.g., similar race/ethnicity/sex) (e.g., Bandura 1977; Lawler and Thye 1999).

## Conclusion

Motivation theories demonstrate that sector preferences explain, to some extent, the motives of workers. Pay, especially when it is scarce, and sector-based value preferences, encapsulated in public service motivation theory, only partially explain motivation. The organizational structure, job characteristics, employee expectations, and social dynamics of one's work environment are also highly relevant. Motivation is, arguably, another name for utility. Just as there are many forms of utility, there are many sources of motivations, indicated by the relative mix of intrinsic (nonmonetary, including recognition, friendship, and public service) and extrinsic (salary or wages, health, retirement, etc.) benefits. Understanding how employees place different relative values on these properties of employment will provide greater understanding about when performance

pay is, and is not, likely to work, especially in the public sector.

wellbeing such as education, health, living standards, longevity, etc.

**Pro-poorness of growth**: *growth* is pro-*poor* when it is mainly benefited to the poor.

## Introduction

Since independence in 1960, chronic unstable security situation in Chad has hindered growth and poverty reduction. During the 1990s, the growth rate has dropped to 3% per year according to the National Institute of Statistic, Economic and Demographic Studies (INSEED). This low economic performance was mainly due to the recurrent political instability and inadequate levels of investments.

In 2003, the country was experiencing the oil exploitation that has had a significant stimulatory effect on the GDP growth. The oil GDP growth from 2002 to 2006 was 7.4% against 6.6% for the non-oil GDP (PND 2013) (National Development Program). The rate of GDP growth which was 3% average in the 1990s reached the peak of 34.7% in 2004 and remains on average about 7% from 2001 to 2013 (INSEED 2013). This peak reached in 2004 coincided with the short period of maximum oil production from 2004 to 2005.

Despite the economic performance due to oil, Chad does not record good indicators of human development. For example, the country is renked 185th over 188 countries in 2016 according to its Human Development Index that was 0.39. Similarly, poverty indices of the country are bad compared with those of sub-Saharan Africa. The results of the third Consumption and the Informal Sector Survey in Chad of National Institute of Statistic, Economic and Demographic Studies (INSEED) show that 46.7% of Chadians live in extreme income poverty in 2011 against 54.8% in 2003. Poverty has reduced, but the number of poor people has increased by 14% from 4.111 to 4.673 million between 2003 and 2011 (World Bank 2013).

Since 2003, the government has set up National Poverty Reduction Papers (NPRP1 from 2003 to 2006 and NPRP2 from 2008 to 2011). These strategies are reinforced by the law 001/PRC/99 in 1999 stating the management and allocation of oil revenues across the country in order to better contribute to poverty reduction. The incidence and depth of poverty was reduced from only eight and five points, respectively, in 2003 and 2011, while the gap between the rich and the poor has widened (INSEED 2013). The intensity of income inequality captured by the Gini index increased by 6.9%, from 0.394 to 0.421 in the same period (World Bank 2013), indicating an unequal distribution of the sources of growth in Chad.

The oil revenues investment should be used to address the development issues at national and subnational levels. In other words, oil revenues should contribute to improve households' wellbeing which includes monetary and non-monetary dimensions. Indeed, the monetary dimension of wellbeing does not give more information about the capabilities of household such as access to health and education basic infrastructures and household environmental facilities. Therefore, it's important to know how disparities related to multidimensional poverty has changed between 2003 and 2011. This study investigates the multidimensional poverty and the pro-poorness of growth in Chad between 2003 and 2011 in a context of oil exploitation.

The second section of the chapter presents the literature review. Sections "Methodology" and "Results," respectively, present the methodology and discuss the results. The last section concludes.

## Literature Review

### The Multidimensional Poverty and Inequality

Understanding the multidimensional aspect of poverty has received growing interest, and a number of multidimensional measures of poverty have been proposed in the literature. The multidimensional measures of poverty summarize wellbeing as a set of different attributes of wellbeing (Alkire et al. 2016). The basic assumption of any multidimensional approach of wellbeing and poverty analysis is that there are relevant dimensions of wellbeing that the economic resources are not able to capture (Martinetti 2000). Foster et al. (1984), Chakravarty (1983), and Shorrocks (1995), have

proposed unidimensional measure of income poverty based on income or consumption. However, income or consumption does not fully describe what individuals can really access. Therefore, measuring poverty based on single dimension (income, consumption) is susceptible to involve biases. These measures do not always highlight every poverty facets and can hide strong differences and inequalities. Moreover, there are many aspects of wellbeing that cannot be monetized such as living standards, health, longevity, education, etc.

The most used methods to compute multidimensional poverty in Africa are the multiple correspondence analysis (MCA) approach (Ki et al. 2005; Asselin 2009), the fuzzy set approach (Diallo 2012; Hounkpodote 2009), and the Alkire-Foster methodology (Alkire et al. 2014, 2016; Agbodji et al. 2015). Ningaye et al. (2011) relied on a MCA to assess the multidimensional poverty in Cameroon. They found evidence that multidimensional poverty can be divided in three spaces (the extreme multipoverty space, the non-multipoverty space, and the space between) and that living in rural areas increases the risk of multidimensional poverty by about 76 times. Appiah-Kubi et al. (2007) analyzed the multidimensional poverty and living condition in Ghana using the fuzzy set theoretic framework on micro data from the Ghana Living Standard Surveys realized in 1991–1992 and 1998–1999. The results reveal that the composite deprivation degree is 0.21 for the whole country that is lower than the head count index of 0.39. Relying on Alkire and Foster multidimensional poverty measures, Batana (2013) estimates multidimensional poverty among women in 14 sub-Saharan African countries and made evidence that the lack of schooling is the most contributor to poverty.

The benefits of growth will remain incomplete if poor's living conditions are not improved. Any policy design that intends to alleviate poverty should also ensures uniformly and equally share of economic progress among different population subgroups within a society. Seth and Alkire (2014) stated that poverty can be mitigated by reducing both its intensity and incidence and also by incorporating inequality concerns. Inequality refers to the difference between or within individuals groups. This difference can be whether a difference in income or wealth distribution or difference in individuals' welfare attributes.

There is evidence that inequality plays an important role in poverty reduction. Using the 1990s rural and urban sector cross-sectional data from a sample of sub-Saharan African (SSA) countries, Fosu (2008) find that more equitable income distribution enhances the impact of growth on poverty. Ali and Thorbecke (2000) estimating poverty path in SSA have shown that poverty has decreased in countries where inequality has declined. Kalwij and Verschoor (2007) assessed the relationship between economic growth and poverty reduction using panel data of 58 developing countries for the period 1980–1998. Authors found that the responsiveness of income growth to poverty reduction is largely explained by income distribution.

### The Pro-poorness of the Nonmonetary Wellbeing

The analysis of the pro-poorness of growth in literature focuses extensively on the income dimension of wellbeing and lead to neglect the non-income dimension of wellbeing (Grosse et al. 2008; Klasen 2008; Lachaud 2007; Oyekale 2015). However, as noted by Kakwani and Pernia (2000), poverty is multidimensional phenomenon. Therefore, considering single dimension in the pro-poorness analysis is "futile." The pro-poor growth analysis should be undertaken using multidimensional approach as noted by Berenger and Bresson (2012). For instance, Grosse et al. (2008) extended the use of growth incidence curves (GIC) in non-income dimension such as education, vaccinations, stunting, mortality, and a composite multidimensional wellbeing measure. This method helps to analyze improvements in different income groups. The empirical results, when considering the case of Bolivia in the period 1989–1998, suggest that growth was pro-poor in both income and non-income dimension in the relative and the weak absolute sense. Recall that pro-poor growth can also be defined in the relative, weak absolute, and strong absolute sense (Grosse et al. 2008; Kakwani et al. 2004; Klasen

2008). The "relative" definition of pro-poor growth suggests that growth benefits more to the poor than to the rich and the relative inequality between the poor and the rich must come down. In the "weak absolute" sense, pro-poor growth simply means that the growth rate of the poor is greater than 0. Finally, the pro-poor growth is said "strong absolute" if the absolute benefits of the poor is larger than those of the rich, meaning that the gap between poor and rich falls.

Uppal (2014) analyzed the pro-poorness of growth in both unidimensional and multidimensional approach in India between 2004–2005 and 2009–2010. The results suggest that in general poverty had declined, but the growth had not been pro-poor over the period of the study. The biggest contributors to poverty were the dimension of education and cooking fuel. Therefore, it has been suggested that government must spend more on this dimension in order to improve wellbeing. In African contest, Lachaud (2007) concluded that the growth was pro-poor in both monetary and nonmonetary dimensions over the period 1994–2003 in Burkina Faso. Indeed, rich was mostly affected than poor by the decline in expenditure and capabilities. However, contrary to other studies, growth was not pro-poor in absolute sense in both national and rural area. Evidence of anti-poor (anti-poor growth is a situation where the negative growth raises poverty, even if there is improvement in inequality (Kakwani et al. 2004)) monetary growth was found in absolute and relative sense in the cities. More importantly, this last author concluded that analyzing the pro-poorness of growth in the income dimension leads to very similar results when taking into account non-income dimension. In addition, the reduction of monetary or nonmonetary poverty due to growth largely depends on the initial level of development.

In the case of Morocco over the period 1987–2004, El Bouhadi et al. (2010) analyzed the pro-poorness of growth in the multidimensional approach by constructing a wellbeing composite index (WCI) based on some primary indicators on the living conditions of the household, the possession of consumer durable goods, and the level of health and education. While the growth was pro-poor in the relative terms at the national level, the story was totally different in urban and rural area. Both poorest and richest households were positively affected by economic growth in urban area, contrary to the rural area where the situation was symmetrically opposed. In Benin, Djossou et al. (2017) found that growth has generally been pro-poor in Benin between 2006 and 2011, even though it is with disparities across subgroups such as women and elderly. Authors found that while there was general improvement in the livelihood of women and the elderly, this mostly favored the non-poor, relative to the poor.

By opposite, Berenger and Bresson (2012), El Bouhadi et al. (2010) found no consistent results between the multidimensional approach and the monetary framework of pro-poor growth. Oyekale (2015) analyzed the pro-poorness of growth using the multidimensional approach in Nigeria over the period 1999–2008. The results showed that in general the growth was not pro-poor in many zones and states.

The use of non-income approach in the pro-poorness of growth is not only the simple translation of what is considered as up to date in the poverty analysis but mainly depends on the policy relevance of the results. Indeed, by focusing on the multidimensional of pro-poor growth, policymakers can be more efficient by targeting the most affected income groups or regions and designing focused policies.

## Methodology

### Data

Data used for this research come from the Chadian household consumption and informal sector surveys ECOSIT 2 and ECOSIT 3 conducted in 2003 and 2011, respectively, by the National Institute of Statistics, Economics and Demographic Studies (INSEED). ECOSIT 2 and ECOSIT 3 contain, respectively, 6695 and 9259 households and are representative survey at national, regional, and departmental levels and collect information related to household characteristics, living conditions, income, employment, education, and other variables.

### Assessing the Multidimensional Index of Wellbeing (MDV)

The objective of this work is, on one hand, to assess the multidimensional wellbeing in Chad between 2003 and 2011 and, on second hand, to analyze the pro-poorness of growth on that period. For this purpose, we initially focus on four dimensions of wellbeing that can potentially be affected by oil revenue investments and transfers to build a multidimensional index of wellbeing (MDW) and inequality. These dimensions are housing, education, health infrastructures, and durable goods according to information available in ECOSIT databases. (These dimensions reflect the sectors where oil revenues are mostly spent according to the National Poverty Reduction Papers (NPRP1 from 2003 to 2006 and NPRP2 from 2008 to 2011).)

Considering the fact that all indicators of these dimensions of wellbeing are categorical, we used the multiple correspondence analysis (MCA) technique to estimate the individual scores of wellbeing. In this vein, the individual $i$ nonmonetary wellbeing can be quantified following the formula:

$$W_i = \frac{\sum_{k=1}^{K} \sum_{j_k=1}^{J_k} w_{j_k} I_{i,j_k}}{K}$$

where $K$ is the number of categorical variables, $J_k$ is the number of categories for indicator $k$, $I_{i,j_k}$ is the binary indicator taking 1 if the individual $i$ has the category $j_k$, and $w_{j_k}$ is the normalized first axis score of the category $j_k$.

From the MDW score, we compute multidimensional inequality index following Araar (2009).

### Estimating the Non-income Pro-poor Growth

The measurement techniques of pro-poor growth are largely focusing on income dimensions. Thin attention has been put on multidimensionality of pro-poor growth. Given that poverty is a multidimensional phenomenon, the pro-poor growth measure should also be multidimensional (Kakwani and Pernia 2000). In this end, we follow Grosse et al. (2008) inspired by Klasen (2008), by extending the growth incidence curve analysis to nonmonetary dimensions.

We measure the pro-poor growth using outcome-based welfare indicators as housing infrastructures and environmental facilities, basic education infrastructures, and durable goods selected via the multiple correspondence analysis (MCA) principles. Thus, to obtain the non-income growth incidence curve (NIGIC), we rank individuals by their scores of wellbeing computed via the non-income indicators and generate the population centiles based on this ranking.

## Results

### The Multidimensional Wellbeing in Chad

The multidimensional wellbeing analysis suggests that the poor are similar in their characteristics. They lack every durable goods: air conditioning, fridge, car, fan, phone, and even radio. Thus, they cannot have any access to information and communication. The poor live in rural areas where there is no modern source of lighting and wood is the most important cooking means. Poor individual housing is not safe and sound. The following materials which are generally used to build houses lead to very little resistance to natural disasters: straw/banco, thatched roof, and clay. Moreover, in poor environment, garbage is thrown away in nature, and there is no hygienic toilet. This suggests that the poor live in unhealthy environments.

The density curves by dimensions indicate that individuals in urban areas have better scores in education, housing, and durable goods than those in rural areas (Fig. 1). This suggests that individuals living in rural areas are the poorest considering education, housing, and durable goods dimensions. One of the main explanations can be the fact that oil revenue was mostly redistributed and invested to the urban area.

The multidimensional inequality calculation (Table 1) shows that multidimensional inequality has slightly increase between 2003 and 2011 from 0.591 to 0.609 even though the household welfare has decreased over time in Chad. It suggests that

**Multidimensional Poverty Dynamic in Chad, Analysis of, Fig. 1** Density curves of the contribution of scores by dimensions. (Source: Authors' estimation)

**Multidimensional Poverty Dynamic in Chad, Analysis of, Table 1** Calculation of the MDI

| | MDI index | Dimensions relative contributions to the MDI (%) | | |
|---|---|---|---|---|
| | | Housing | Education | Durable goods |
| 2003 | 0.596226 | 28.59 | 31.78 | 39.62 |
| 2011 | 0.615578 | 30.76 | 33.14 | 36.10 |
| Population | 0.609208 | 30.11 | 32.38 | 37.51 |

Source: Authors calculation

redistributive and investment policies implemented in the country since the oil production emergence are inefficient in terms of poverty and inequality reduction. Improvement in those policies appears to be necessary. More specifically, when looking at the relative contribution of each dimension to the MDI index, we observe that the durable goods dimension contributes mostly to the multidimensional inequality between 2003 and 2011. The contribution of both housing and educational dimension to the multidimensional inequality has slightly increased over time, respectively, from 28.59% to 30.76% and from 31.78% to 33.14%.

However, inequalities between the rich and the poor in durable goods have decreased from 39.62% to 36.10% between 2003 and 2011. This suggests that household welfare in terms of durable goods is relatively effective. Chadians have slight facility to hold the car, fridge, phone, air conditioner, etc. Even if some improvements are needed, the durable goods dimension remains the main contributor in multidimensional inequality in Chad.

## Pro-poor Growth Analysis

Economic policies that are to improve the households' welfare have to promote economic growth and to facilitate access to resources and basic public services (health, education, housing, etc.). Economic growth is the important element in the Poverty-Growth-Inequality nexus. The growth is pro-poor if it reduces both inequality and poverty. However, strategies to reduce inequality and poverty or to improve the wellbeing of households through growth cannot produce the expected effects if they do not target both monetary and nonmonetary dimensions of wellbeing.

Figure 2a shows that the log of scores, computed by the MCA method, follow normal distribution. The density curve has shifted to the right side in 2011 indicating the improvement of overall wellbeing. Figure 2b indicates that the density – population proportion – with low MDW levels has decreased between 2003 and 2011. But an

**Multidimensional Poverty Dynamic in Chad, Analysis of, Fig. 2** The density of the log of scores. (Source: Authors' estimation)

accurate analysis of the evolution of multidimensional wellbeing following the social classes (rich, poor) can be made through the growth incidence curve.

The growth incidence curve of wealth takes on a U shape to indicate an increase in the bipolarization of the distribution of wealth (Fig. 3). It shows that 20% of the poorest and 20% of the richest benefited from public services and facilities, whereas the wealth of the large middle class decreased between 2003 and 2011. The wealth of the first poorest decile group has registered a positive growth. For the middle class, located between the 40th and 70th percentile, the growth was negative. These results suggest that the poorest who are mainly constituted by the household from rural areas have earned from the public services improvement (education, health, etc.) thanks to oil revenues investment in these areas. The richest who live in urban areas benefited more from facilities largely concentrated in towns as N'Djamena for example.

An analysis of growth incidence curve following the residence areas produces interesting results as indicated in Fig. 4. This result shows that the poor access to basic services (education, health, and housing) has not improved in urban areas between 2003 and 2011. In other words, the public services, available in urban areas, are not easily accessible to urban poor. However, in rural areas, GIC suggests that the poorest have benefited from the wealth generated during this period, but the wealth of the rich class has declined. Therefore, the situation of the poor in urban areas requires more attention to improve their access to infrastructure and facilities.

The non-income growth incidence curves by dimension of wellbeing (Fig. 5) show the growth in education lies under 0 implying that the growth in this dimension is not pro-poor in the "weak absolute" sense as demonstrated by Grosse et al. (2008) or Klasen (2008). There is slight improvement in durable goods dimension from 10 to 100 percentiles. The NIGIC in the housing side takes U shape as the overall non-income incidence curve (Fig. 3) means that the housing has some determinant effects in the global wellbeing.

The conditional NIGIC (Fig. 6) shows how progress in a particular aspect of human welfare (education, housing, and durable goods) is distributed across the income distribution. The results suggest that the progress in housing and durable goods is well distributed across the income distribution, which means that the public social spending programs have reached the targeted income-poorest population groups. In return, the education progress failed given that the income distributional pattern of improvements in education lies under 0. This implies that the public resources are

**Multidimensional Poverty Dynamic in Chad, Analysis of, Fig. 3** Overall growth incidence curve. (Source: Authors' estimation)

**Multidimensional Poverty Dynamic in Chad, Analysis of, Fig. 4** The growth incidence curves by area. (Source: Authors' estimation)

not effectively allocated and used efficiently in the education project in Chad.

The scores and the contributions of indicators of each dimension of wellbeing are presented in Table A in appendix (available upon request). Weights determine the extent to which the selected attributes contribute to wellbeing. The smaller the number of households deprived in an attribute, the greater the weight attached to it (the reasoning is that if owning a radio is much more common than owning a TV, a greater weight should be given to the former indicator so that if a household does not own a radio, this rare occurrence will be taken much more into account in computing the poverty index than if some household does not own a TV, a case which is assumed to be more frequent) (Aaberge and Brandolini 2014; Ezzrari and Verme 2013; Njong and Ningaye 2008). The value of the MDW for a given individual is the average of

**Multidimensional Poverty Dynamic in Chad, Analysis of, Fig. 5** Non-income growth incidence curves by wellbeing dimension. (Source: Authors' estimation)

**Multidimensional Poverty Dynamic in Chad, Analysis of, Fig. 6** Conditional non-income growth incidence curves. (Source: Authors' estimation)

its category weights (Asselin 2002). The state of poverty is described by the indicators negatively correlated to the first axis, while wellbeing is captured by the indicators that are positively correlated. A review of the most negatively correlated variables to the first axis allows identifying poor households as those: living in rural area, without radio, cooking with wood, without hygienic toilet and garbage vacation, and do not know to write.

## Conclusion

The objective of this study is to analyze the evolution of multidimensional wellbeing and the propoorness of growth in Chad since the boom in oil exploitation in 2003. The study employs the framework based on the construction of a multidimensional wellbeing scores with the MCA technique. It also uses the growth incidence curves tools. Data used come from Chad household

M

consumption and informal sector surveys (ECOSIT 2 and ECOSIT 3 conducted in 2003 and 2011, respectively). The results suggest that the multidimensional inequality has slightly increased between 2003 and 2011 from 0.591 to 0.609, and both housing and educational dimensions contributions to the multidimensional inequality have increased over time, respectively, from 28.59% to 30.76% and from 31.78% to 33.14%. The durable goods dimension is the main contributor to the MDI index increase, but its contribution decreases from 39.62% to 36.10% between 2003 and 2011. In addition, the GIC indicate that the poorer and richest classes have earned wealth, but for a large middle class, the wealth has decreased. The growth has been pro-poor in Chad between 2003 and 2011 even if the situation of the poor in urban areas requires more attention to improve their access to infrastructure and facilities. The policies aiming to improve the poor wellbeing have to be accompanied by the efficient investment in education and environment facilities (lighting type, hygienic garbage vacation, cooking energy, etc.) and facilitate the household's access to durable good. The urban localities require more attention to better help the poor for access to facilities and services.

# Multidimensional Poverty in Nigeria

Tope Shola Akinyetun
Department of Political Science, Adeniran Ogunsanya College of Education, Oto/Ijanikin, Lagos State, Nigeria

## Synonyms

Intricate disadvantage; Multifaceted hardship; Multiple deprivations; Varied poverty

## Definition

Multidimensional poverty is the condition of suffering from multiple disadvantages such as lack of clean water, poor sanitation, poor nutrition, lack of electricity, limited schooling, and household unemployment.

## Introduction

Research suggests that due to higher economic growth and globalization, extreme global poverty has significantly reduced in the last few decades. This notwithstanding, the number of global poor is still quite large and surpasses the population of the USA, UK, France, and Russia put together. Meanwhile, in the sub-Saharan region, the number has gone up by 100 million in the last three decades. The reason, among others, is that the same process of globalization that has helped reduce poverty has also entrenched inequality of wealth and income in most nations and produced new opportunities for corruption, at the expense of quality of life.

However, against the traditional conception of poverty from monetary perspectives, income and wealth have become inadequate in classifying the poor. Attention has recently been drawn to essential factors such as living standards, education, sanitation, health, electricity, and clean water – among others. In other words, it has become essential to characterize poverty beyond monetary-based measurements through an all-encompassing approach termed multidimensional poverty.

Observably, Nigeria, recently branded the poverty capital of the world, exemplifies a country plagued with multidimensional poverty. This is due to the surge in the number of poor people and the prevalence of hunger, poor nutrition, low living standards, deprivation, illiteracy, poor electricity, poor sanitation and restricted access to potable water, particularly in rural areas, and the lack of access to the health care system.

## Poverty

The concept of poverty is contentious. Meanwhile, no matter how one looks at it, poverty centers on lack of access to resources or inability to meet one's needs. According to Townsend (1979: 31), "individuals, families and groups in the population can be said to be in poverty when they lack resources to obtain the type of diet, participate in the activities and have the living conditions and amenities which are customary, or at least widely encouraged and approved, in the societies in which they belong." Poverty is a result of the inability of individuals, groups, and society to meet up the minimum required social and economic infrastructure needed for survival, a condition where individuals or groups could not afford the cost to obtain desired goods and services in the economy. There is, to be sure, a non-negligible relationship between poverty and inequality. Poverty is revealed in the economic distance, the economic distance being an entrenched dimension of inequality. This does not imply that there will always be poverty when there is inequality, even though poverty will always manifest in a stage of heightened economic distance.

## Poverty Incidence in Nigeria

Available data from the World Bank Gini index shows that Nigeria is among the 20 countries in the world with the widest gap between the rich and the poor. The Gini index measures the extent to which the distribution or households within an economy deviate from a perfectly equal distribution. A Gini index of zero represents perfect equality while an index of 100 implies perfect inequality. Nigeria has one of the highest Gini indexes in the world, 43.0, compared to other countries such as India (37.8), Bangladesh (32.4), DR Congo (42.1), and Ethiopia (35). According to Ajakaiye et al. (2016), poverty is widespread in Nigeria no matter the method used in computing it, and the incidence has been on the rise over the last ten years. Although, urban poverty has been consistently lower than rural poverty, poverty generally appears to be more prevalent in the northern part of the country with the highest rates hovering between the northeast and northwest zones. The high poverty rate had even become more pronounced by 2010 as virtually all the zones of the country had over 60% poverty incidence.

Due to this high poverty incidence, Nigeria has witnessed an increase in electoral violence, crime, terrorism, and insurgency, especially in the northern part of the country which has the worst indices of poverty compared to the other zones. The country has, in recent times, recorded an upsurge in joblessness, cybercrime, illiteracy, maternal mortality, early marriage, and impunity. These factors continually serve as the foundation of turbulence in all sectors of the country. As a result, there is the imperativeness to describe the extent and severity of poverty from various dimensions, multidimensional poverty.

## Multidimensional Poverty

Multidimensional poverty, according to Rippin (2017), is a holistic appraisal of the relationship between different poverty dimensions and the spread of simultaneous deprivations across the population. Thus, multidimensional poverty measures the spread of simultaneous deprivations across the population while considering the relationship between different poverty dimensions. That is, rather than restrict the definition or measurement of poverty to just simultaneous deprivations (which Rippin referred to as distribution-sensitivity) or poverty dimensions (association-sensitivity or efficiency), multidimensional poverty measures distribution-sensitivity and association-sensitivity. As conceived in this entry, multidimensional poverty is the study and measurement of poverty from various dimensions such as health, education, living standard, sanitation, access to water, electricity, and good

housing. It evolves beyond the one-dimensionality of the study of poverty.

Nonmonetary measurements of poverty were advanced to address the invalidation of the monetary-based method and look beyond income and wealth in measuring poverty. A model of nonmonetary measurement of poverty is the Multidimensional Poverty Index (MPI) developed by the Human Development Report Office of the United Nations Development Programme [UNDP] in collaboration with the Oxford Poverty and Human Development Initiative [OPHI]. It was first published in the 2010 UNDP Global Human Development Report. The MPI complements indirect methods that identify minimum living standards through income or consumption levels. It examines how well people satisfy minimum international standards in social rights (Alkire and Santos 2014). The MPI is an attempt to move beyond the traditional focus on aggregates and to stimulate reasoned public debate. The MPI assesses three main dimensions: health, education, and standard of living, and by MPI standard, individuals who are deprived of at least one-third of the weighted indicators are adjudged to be living in multidimensional poverty.

Multidimensional poverty index (MPI) compares multidimensional poverty in over one hundred (100) countries. It was developed by Alkire and Santos (2014) to identify multiple deprivations at the household and individual levels, particularly regarding dimensions such as health, education, and living standard. The MPI is determined by calculating the headcount and deprivation severity of multidimensionally poor households.

## Multidimensional Poverty in Nigeria

The dimensions of multidimensional poverty are equally weighted (1/4) and further divided across ten (10) indicators. Education, for instance, includes two indicators: years of schooling and child school attendance. Hence, to refer to a household as being deprived concerning education, such a household will have a member who is 15 years and above and has not completed 5 years of schooling. A household is also deprived of education if any child in the household between ages 5 and 15 years is not attending school. The health dimension of the MPI is represented by child mortality and nutrition. A household can be classified as deprived in mortality if any child less than 18 years has died in the household 5 years before the survey. Concerning nutrition, a household is deprived when at least one member is undernourished. The Standard of living dimension is indicated by cooking fuel, sanitation, drinking water, electricity, housing, and assets. For cooking fuel, a household that cooks with dung, wood, charcoal, or coal is deprived. Although sanitation is exhibited with other households, yet, a household that fails to improve its sanitation facility is deprived of sanitation. Concerning drinking water, a household that does not have access to safe drinking water within a short distance is deprived. A household is also deprived if it has floors, roofs, and walls made up of rudimentary materials. Moreover, a household that lacks one or more assets, such as radio, television, telephone, computer, bicycle, motorbike, or car, is said to be asset deprived.

Research indicates that 42.8% of the rural households in Nigeria consume limited food, 32.3% engage in the reduction of meal size, 29.8% skip meals as a means of coping with poverty, about 16.7% always feed their young one first before consuming the remaining food, and 10.6% borrow food from their neighbors. About 9.3% consume nothing throughout the day; this could mean that they engaged in fasting whenever there was a food shortage in the house, while only 7.7% of households sleep hungrily and about 3.2% engage in working on other people's farms for wages to support their households (Amao et al. 2017). More so, the spatial and temporal multidimensional poverty in Nigeria between 1999 and 2008 shows that urban and rural sectors experienced deterioration in two indicators – water and electricity for urban populations and shelter and education for rural

**Multidimensional Poverty in Nigeria, Table 1** Global MPI in Nigeria, 2020

| Area | MPI | H | A | Vulnerable | Severe poverty | Population share |
|---|---|---|---|---|---|---|
| National | 0.254 | 46.4% | 54.8% | 19.2% | 26.8% | 100.0% |
| Urban | 0.106 | 22.9% | 46.4% | 23.0% | 7.8% | 44.3% |
| Rural | 0.372 | 65.1% | 57.2% | 16.2% | 42.0% | 55.7% |

areas. The North Central zone performed the worst with negative changes in all welfare indicators except sanitation (Ajakaiye et al. 2016).

Regional inequalities remain profound with huge disparities between the urban and rural sectors as well as between the southern and northern geopolitical zones of the country. The distribution of positive economic performance has not translated to improvements in multidimensional welfare throughout the country over time. Regional inequalities remain profound, with large disparities between the urban and rural sectors as well as between the southern and northern geopolitical zones of the country. The national MPI for Nigeria includes unemployment as a dimension. This indicates that a household with a 15-year-old member and above who is available for work, yet is looking for one, is employment deprived. A household in Nigeria is multidimensionally poor if it is deprived of more than ¼ of the weighted indicators. Employment and education (years of schooling and school attendance) are the largest weighted contribution to poverty in the country. Moreover, there is a high incidence of poverty across the northern states, with over 80% of their population classified as multidimensionally poor. This contrasts with the southern states of the country (Southwest particularly) which have a comparatively lower poverty incidence.

The headcount ratios by poverty measures by Oxford Poverty and Human Development Initiative [OPHDI] show that by global MPI measure, 46.4% of Nigerians are poor; using $1.90 a day measure, 53.5% are poor; by $3.10 a day measure, 77.6% are poor; and by national measure (national income, consumption, and expenditure), 46.0% Nigerians are poor (see Table 1) (OPHDI 2020). To have a further grasp of the extent of multidimensional poverty in Nigeria, it is imperative to compare the MPI in selected developing countries like Algeria, Kenya, Congo, South Africa, and Nigeria. It is clear that Nigeria has the highest intensity of deprivation (56.6%), the largest number of poor people (98,175), the highest population of people in severe multidimensional poverty (32.3%), and the highest inequality value (0.029).

As part of the National Human Development Report 2018, the National Multidimensional Poverty Index for Nigeria (NG-MPI) was published and commissioned by UNDP Nigeria in collaboration with the National Bureau of Statistics. The national MPI for Nigeria has a total of 11 indicators covering the four equally weighted dimensions of education, health, living standards, and unemployment. The NG-MPI was computed at a subnational level using data from the 2017 Human Development Indices Survey and covered rural and urban areas in all of the 36 states and the Federal Capital Territory (FCT) of Abuja. For calculating the NG-MPI, a household is considered multidimensionally poor if it is deprived of more than ¼ of the weighted indicators. For Nigeria, the share of multidimensionally poor people at the national level is 54% with the average intensity of deprivation standing at 42%. The indicators with the largest weighted contribution to poverty in the country are employment, years of schooling, and school attendance.

In a study involving 395 participants in Lagos State, Nigeria, Akinyetun et al. (2021) found out that multidimensional poverty is more pronounced among people between 25 and 34 years old, due to their unemployment and limited education. The majority of the people lack access to

water, healthcare services, good housing facilities, and a stable power supply. A larger percentage of the houses in the rural areas are filthy, uninhabitable, and dilapidated.

## Addressing Multidimensional Poverty Through Social Inclusion

Social inclusion is relative to an environment and seeks to facilitate an inclusive society wherein the fundamental rights of every member are guaranteed and they can participate in economic, social, political, and civic activities, including being actively involved in the decision-making process and enjoying unlimited access to favorable living standards and general well-being. Busatto (2007) states that:

> Inclusion is a community. No one becomes included by receiving handouts, even if these handouts are given by public bodies and with public resources. No one becomes included by being treated by a program in which they are no more than a number or a statistic. Inclusion is a connection to the network of community development, it is to become more than a speck of dust, to have a forename and surname, with one's distinctive features, skills, and abilities, able to receive and give stimulus, to imitate and be imitated, to participate in a process of changing one's own life and collective life. (p. 4)

Inclusion, however, does not take place in a vacuum, rather it is a communal activity wherein the recognition of an individual is ascertained about how well the others in the community are recognized. Inclusion is a conscious effort that requires planning and proper implementation. Inclusion requires every member of society to assume an interdependent role that will stimulate both individual and communal development.

This is not an attempt to ignore the government's increasing efforts at reducing multidimensional poverty through community level and governance programs. Rather, it stresses the need to consolidate the gains made, implement the abandoned ones, and realign the programs needing overhauling. The various programs by the government include Community-based vocational rehabilitation (CBVR) (to facilitate employment for people with disabilities); National Commission for Nomadic Education (NCNE) (to provide education to Almajiri children and adults); Education Sector Support Programme in Nigeria (ESSPIN) (to improve inclusion policies and practices in basic education); Coalitions for Change (C4C) (to increase inclusion by helping civil society organizations work together and better); Voices for Change (V4C) (to change attitudes of women in leadership and decision-making roles, and violence against women and girls); Mobilization for Development (M4D) (to support local governance by strengthening social accountability and tackling social exclusion in local government service delivery); and State Accountability and Voice Initiative (SAVI) (to bolster governance and accountability).

More so, education plays a critical role in social inclusion by enabling the excluded and marginalized to participate in decision-making while furnishing its recipients with the opportunity to learn about historical processes and the ability to effect change. Education is instrumental in human development, regeneration, empowerment, human rights and freedom, reduction of inequalities, and establishment of social cohesion. It is on this note that the Nigerian government in addition to the private sector, civil societies, and nongovernmental organizations is entreated to drive social inclusion through education.

## Synonyms

Bottom-up versus top-down policy analysis; Environmental policy analysis; Network governance; Policy creation and implementation

## Definition

Multilevel governance is an analytical framework through which researchers and policymakers can understand the forces that drive the creation and implementation of policy. It bridges top-down and bottom-up policy initiation. Analysis occurs along five main components (Homsy et al. 2019): (1) the co-production of knowledge vertically and horizontally; (2) the framing of co-benefits; (3) engagement with civil society; (4) provision of fiscal, technical, and other kinds of capacity; and (5) the power of a central authority to coordinate policy and sanction laggards. The framework also recognizes the governance roles of private, nonprofit, and for-profit organizations.

## Introduction

Many complex issues, such as sustainability, challenge traditional governance models, which try to manage issues within physical/political jurisdictions or bureaucratic departments. However, policy development for complex issues needs a multidimensional, cross-jurisdictional, and long-term view (Fiorino 2010). Wicked problems are complicated by differing stakeholder values, institutional complexity, and scientific uncertainty – and often the solutions to these challenges are open to interpretation (Head and Alford 2015). Multilevel governance recognizes that various governmental levels, non-governmental institutions, and citizen input bring together the perspectives and resources necessary to unravel complex problems. The European Union's relationship to its member nations was one of the early situations scrutinized using a multilevel framework (Bulkeley and Betsill 2003).

Multilevel governance bridges decentralized policy action and centralized oversight. The top-down approach worked to clean much of the most heinous pollution in the United States despite a booming economy because such central mandates work best on problems with identifiable pollution

sources and straightforward remedies. However, top-down rules provide little flexibility for adjusting to local circumstances (Mazmanian and Kraft 2009) often resulting in the imposition of "naïve" one-size-fits-all solutions (Ostrom 2010, p. 363). On the other hand, bottom-up solutions to regional and global commons problems seek to fit policy goals to local problems and situations. Local policy action helps improve local compliance and promotes innovative policies (Lutsey and Sperling 2008). However, significant challenges occur with decentralized policymaking including negative externalities, spillovers, regional inequity, and capacity constraints. The lack of policy coordination across a region can result in expensive regulations, poorly formed incentives, or underutilized programs (Salkin and Ostrow 2008).

## Makeup of the Multilevel Governance Analytical Framework

An emerging number of researchers utilize multilevel governance as a better framework for understanding environmental sustainability and other complex regional or commons challenges (Bulkeley 2010; Homsy and Warner 2013). Local governments may initiate environmental protection, but cannot succeed without engaging other cities and towns, higher levels of authority, or subunits, such as neighborhoods. Using the multilevel governance framework, situations can be analyzed across five dimensions: co-production of knowledge, framing of co-benefits, engagement of civil society, provision of capacity, and the coordinating and sanctioning role of a central authority (Homsy et al. 2019).

### Co-production of Knowledge

The lack of local knowledge challenges top-down governance in ways that can make solutions less effective. Local knowledge must be on equal footing with centralized technical expertise (Funtowicz and Ravetz 1993) so that a co-production creates new knowledge from the different perspectives and moderated by situational circumstances (Klenk et al. 2018). Over time, the meeting of expectations and commitments builds trust, and participants start to understand the positions and values of other actors, which can lead to more effective policy implementation (Laurian et al. 2017). Such collaboration represents an increasingly common approach to environmental governance in the United States.

### Framing of Co-benefits

Co-benefits emerged in the 1990s as a way for two or more parties to find value in a policy change. Such a frame helps broaden constituencies for a policy action and helps overcome negative political fallout. For example, a local government may seek to reduce greenhouse gas emissions because it will also result in lower energy costs, increased public health, or economic development. A co-benefits frame can stimulate local action because residents see concerns as important to them.

### Engagement of Civil Society

Citizens can push governments to act, as well as collaborate in research and monitor policy implementation. For example, citizens appointed to local government committees push environmental action in the United States (Homsy and Warner 2015). Cities with wealthier and more educated residents see wider participation around policy discussions, which boosts sustainability outcomes (Cruz and Smith 2016). An important power of civil society includes the ability of citizens to seek compensation or to force action through the judiciary.

### Provision of Capacity

Policy production and implementation need resources. Governments need technical, professional, and financial resources to act. In many cases, higher levels of government have the ability to mobilize the resources and capacity that individual communities lack. These resources can also come from nongovernmental or

semigovernmental organizations, such as municipally owned utilities (Homsy 2018).

### Sanctioning and Coordinating Authority

Within the multilevel framework, a central sanctioning and coordinating authority helps frame the challenges, provides support, determines the distribution of externalities, provides organizational structure, and coerces decentralized parties to act (Homsy and Warner 2013). This authority shares power and does not solely control technical expertise or policymaking; it therefore can encourage local innovation and disseminate best practices. This central entity has the power to sanction non-compliance and ensure decentralized actors coordinate around policy goals (Milward and Provan 2000).

## Example of Multilevel Governance Analysis: Management of the Rouge River Watershed in the United States

This section illustrates how a multilevel analysis enables us to understand the reasons for a successful policy solution to a complex problem. The Rouge River watershed in the US State of Michigan consists of four waterways: a 71 km-long main stream and three major branches. The 1210-km$^2$ Rouge River watershed has more than 1.5 million people living in 48 jurisdictions. For decades, oil from auto companies and waste from steel mills turned the Rouge River into one of the most polluted in the nation. Frustrated by the lack of decentralized action of local and state governments, the US national government imposed top-down sanctions that stopped some of the most toxic pollution.

However, the river still was not clean. As the industrial pollution decreased, a more complex problem emerged. Nonpoint source pollution from a large diversity of sources across the region, such as farm fertilizer, pesticides, and animal waste runoff, continued to damage the watershed. Stormwater runoff still brought significant heavy metals into the river, and scores of local communities dumped millions of gallons of untreated sewage into the waterway every year. To tackle this complex problem, the US Environmental Protection Agency decided to partner with local governments on a cleanup program (U.S. EPA 2003). Using the sanction threat of an expensive federal court order, the US federal government coerced municipalities to sign on to a project that they would eventually design. Each of the five components of the multilevel governance framework is illustrated in this case example.

*Local knowledge and co-production*. Federal officials in the United States recognized that different parts of the Rouge River watershed required different cleanup efforts and that the imposition of a top-down solution would be ineffective. The work of geographically-based working groups revealed that urban and industrialized places might need expensive, engineered solutions, while suburban and rural areas could take a different approach. The involvement of local residents allowed for the targeting of problem spots, such as particular businesses or farms, to find specific and effective solutions. The co-production led to a watershed cleanup effort that fit solutions to particular problems. Citizen groups then monitored the results by working with researchers to count indicator wildlife such as frogs, toads, and insects.

*Framing of co-benefits*. In the Rouge River project, local cleanup efforts are aligned with other economic benefits, especially around the recreation and tourism industries. These co-benefits built political support among a wide variety of constituents. Putrid smells, sewage backups, and dead waterfowl brought together residents, hunters, and public health officials. Each recognized the problem's severity from a different perspective, and these groups pushed for change.

*Engagement of civil society.* The Rouge River cleanup effort included local municipal leaders, community residents, and other stakeholders – and the project undertook a major outreach campaign. Eventually, the federal government stepped

back from managing the project and turned operations over to a nonprofit organization, the Alliance of Rouge Communities, whose main members are local governments and whose associate members include local research and educational institutions and environmental groups.

*Provision of capacity.* Capacity is also a critical component of the multilevel framework. The US federal government spent hundreds of millions of dollars on the Rouge River cleanup – something that state and local authorities would not have been able to do on their own. The funds were spread across different watershed projects, which are now overseen by the Alliance of Rouge Communities organization.

*A coordinating and sanctioning central authority.* On their own, the municipalities, businesses, farms, citizens, and other stakeholders could not solve the complex challenge of non-point source pollution in the Rouge River watershed. The federal government intervened with the sanctioning threat of an expensive lawsuit and that brought the disparate players to the table. The federal government, often through the State of Michigan, coordinated the various stakeholders in an approach that enabled actors to understand the perspectives of others.

## Conclusion

This encyclopedia entry described the five components that make up the multilevel governance analytical framework (framing of co-benefits, engagement of civil society, the co-production of knowledge, the provision of capacity, and the power to sanction and coordinate) and demonstrated how those can illuminate a specific case of policy success. The framework also has been used to understand how other implementation efforts fall short, such as the case of air pollution management policies in China (Homsy et al. 2019).

An important theoretical question moving forward is whether a multilevel governance framework can be used to hold higher levels of government accountable. In both the United States, under President Trump, and China under President Xi, pressure from lower levels may force the national government to enforce laws. The multilevel framework, through the co-production of knowledge and the framing of co-benefits, may instill norms and values at lower levels that cause subnational governments and citizens to pressure the national government to maintain or increase support for environmental protection. It remains to be seen if the sharing of power within a multilevel system provides lower level entities an avenue of upward sanctioning power to push the national government to continue enforcing environmental laws.

A multilevel governance framework provides researchers with an analytical structure that potentially explains the manner in which top-down and bottom-up governance can come together. Future research can test its application in other circumstances around issues of sustainability and in other vertically and horizontally integrated service provision efforts. In practice, this framework enables policymakers to understand the broad range of components needed to tackle regional and global commons issues.

# Multilevel Governance and Public Administration, Russia

Ivan Leksin
Lomonosov Moscow State University, School of Public Administration, Moscow, Russian Federation

## Synonyms

Multilevel Government and Public Administration

## Introduction: Orders of Government

To a first approximation, three levels of government exist in Russia: federal, regional, and local. However, neither the federal nor the regional or local governments are single-tier ones by themselves. Federal executive bodies can establish supraregional, regional, and local offices (see, Federal Government, Russia; Regional Executives, Russia). Regional governments have territorial offices as well. As a rule, such offices are being formed by specialized executive bodies (ministries, departments, boards, committees, commissions, inspections, etc.). However, in some constituent units of the Russian Federation, these offices include the ones performing general administrative functions. Thus, in Saint Petersburg, area administrations are the local offices of the city government, while the Moscow City Government has such offices at both district and subdistrict (area) levels. The local self-government is usually regarded as a solid level of government; however, the Federal Law No. 131-FZ dd. 6 October 2003, "On the General

Organizational Principles of Local Self-government in the Russian Federation," provides for both single-tier and two-level municipal organization (see ▶ Institutional Foundations of Local Self-Government, Russia).

Currently Russia comprises 85 constituent units that cover its complete land territory leaving no federal enclaves. The said constituent units are literally "subjects of the Russian Federation" (in Russian, this collocation does not imply their subordinate position to the Federation, but is semantically equivalent to "members of the Federation"):

- Twenty-two republics
- Nine "territories" ("krais")
- Forty-six "provinces" ("oblasts")
- Three city regions ("cities of federal significance")
- One "autonomous province" ("autonomous oblast")
- Four "autonomous districts" or "autonomous areas" ("autonomous okrugs").

In 2000, supraregional territorial divisions called "federal districts" were established by Decree of the President of the Russian Federation No. 849 dd. 2 February 2000, "On the Plenipotentiary Representative of the President of the Russian Federation in the federal district." Currently, constituent units of the Russian Federation are grouped into eight federal districts, each headed by a plenipotentiary representative of the federal President. These officials were never supposed to be rulers, but, since their emergence, they had been being perceived as supraregional supervisors.

Constituent units of the Russian Federation vary considerably by area and population size, as well as in other respects. Surprisingly, Russia's constituent units' governments can even constitute a quasi-hierarchy. Three of the four autonomous okrugs are situated within oblasts. Thus, the both regional governments can have jurisdiction over the same territory and same population. This is a knotty heritage of the Soviet administrative system. In 1992, both oblasts and autonomous okrugs were vested with political autonomy and became constituent units of the Russian Federation. Constitutionally, they are equal. But this equality means they have to share their jurisdiction, and the final distribution of powers would depend on their political and economic weights. This fact explains why this odd construction is regarded as a vanishing one. Only three of the original nine "intraregional" autonomous okrugs survived. In 2005–2008 the relatively weak ones had been merged with either oblasts or krai they used to be parts of. The remaining three autonomous okrugs are the wealthiest regions of Russia due to the ample supplies of natural resources. All of them concluded agreements with the respective oblasts on distribution of jurisdiction (Leksin 2014).

The whole of the territory of every constituent unit of the Russian Federation is in its turn distributed between municipal entities. These can be established in different forms and vary even more dramatically in their size, population, etc. than the Russian regions do (see ▶ Institutional Foundations of Local Self-Government, Russia).

M

## Division of Powers Between Levels of Government

Reasoning from the number of levels of governments, one could expect the constitutional division of powers to correspond to it. Notwithstanding, the Constitution of the Russian Federation distributes all powers solely between the Russian Federation and its constituent units. In Art. 71 and 72, the federal constitution contains two exclusive lists of powers within federal and joint jurisdictions, while Art. 73 of the Constitution provides a promising declaration that beyond the bounds of jurisdiction of the Russian Federation and the powers of the Russian Federation on the issues under joint jurisdiction of the Russian Federation and its constituent units, the latter shall possess plenary powers. At the same time, the Constitution asserts in Art. 12 that local self-government shall constitute a separated form of governance, independent within certain issues.

The constitutional list of exclusive federal powers enumerates:

- Adoption and amending of the Constitution of the Russian Federation and federal laws and control over their observance
- Federal structure and the territory of the Russian Federation
- "Regulation and protection" of the rights and freedoms of man and citizen, citizenship in the Russian Federation, and "regulation and protection" of the rights of national minorities
- Establishment of the system of federal legislative, executive, and judicial bodies; the rules for their organization and operation; and formation of the federal governing institutions
- Federal property and its management
- Adoption of the principles of federal policy and federal programs related to governmental, economic, ecological, social, cultural, and national development of the Russia
- Establishment of the legal basis for the common market; financial regulation, exchange and credit control, tariff legislation, money issue, and the principles of pricing policy; federal economic services, including federal banks
- Federal budget, federal taxes and dues, and federal funds for regional development
- Federal energy systems, nuclear power engineering, and fissionable materials; federal transportation, communications and information, and outer space activities
- Foreign policy and international relations of the Russian Federation, international treaties and agreements of the Russian Federation, and issues of war and peace
- Foreign economic relations of the Russian Federation
- Defense and security; military production; rules for selling and purchasing weapons, ammunition, and military equipment; and production of poisonous substances and narcotic substances and rules for their use
- Determination of the status and protection of the national frontier, territorial sea, air space, exclusive economic zone, and continental shelf of the Russian Federation
- Judicial system, procuracy; criminal and penal legislation; amnesty and pardoning; civil legislation; procedural legislation; and legal regulation of intellectual property
- Federal law of conflict of laws
- Meteorological service, standards, metric system, horometry, geodesy and cartography, geographical names, official statistics, and accounting
- State awards and honorary titles of the Russian Federation
- Federal public service

The list of powers within joint jurisdiction reads as follows:

- Providing for compliance of the constitutions, statutes, laws, and other normative acts of the constituent units of the Russian Federation with the Constitution of the Russian Federation and federal laws
- Protection of rights and freedoms of the individuals; protection of rights of national minorities; providing for law and order, public security; border zone regime
- Issues of possession, use, and disposal of land, subsoil, water, and other natural resources
- Delimitation of public property
- Nature management, protection of the environment, and ensuring ecological safety; specially protected natural territories, protection of historical and cultural monuments
- General issues of education, science, culture, physical culture, and sports
- "Coordination of issues of health care"; protection of the family, maternity, paternity, and childhood; social protection, including social security
- Measures against catastrophes, natural disasters, epidemics, elimination of their aftermath
- Establishment of common principles of taxation and dues in the Russian Federation
- Administrative, administrative procedural, labor, family, housing, land, water, and forest legislation; legislation on mines and environmental protection
- Personnel of the judicial and law enforcement agencies; advocateship, notary offices
- Protection of the traditional habitat and mode of life of small ethnic communities

- Establishment of common principles of organization of the system of "bodies of state authority" and local self-government
- Coordination of international and foreign economic relations of the constituent units of the Russian Federation, fulfillment of international treaties and agreements of the Russian Federation

These lists taken together with the said ruling of Art. 73 produce a somewhat deceptive impression that the jurisdiction is constitutionally divided between the Federation and its constituent units. However, according to the provisions of Art. 5, para. 2 of the Constitution of the Russian Federation, the federal legislator has wide discretion in managing these issues.

Firstly, under provisions of Art. 76 of the Russian Constitution, these lists refer to the legislative field only. In fact, the Constitution of the Russian Federation divides neither executive nor judiciary powers between orders of government. The federal legislator had taken the distribution of these powers upon himself. Thus, for instance, the fact that the matter falls into the federal jurisdiction according to the Russian Constitution does not mean that the Federation is responsible for public administration and law enforcement regarding this matter. On the contrary, the federal legislator may decide freely that the regional executives will be in charge of implementation of the federal legislative decision, while according to the Federal Constitutional Law No. 1-FKZ dd. 31 December 1996, "On the Judicial System of the Russian Federation," both federal and regional courts are entitled to apply both federal and regional laws. In fact, the federal government tends to concentrate on the policy-making, leaving public administration issues to the regional and local governments (Avakyan 2014).

Secondly, the joint jurisdiction of the Russian Federation and its constituent units is not actually joint. Some intergovernmental coordination in the course of passage of the federal laws on the matters within joint jurisdiction is provided for, but the federal constitution does not set parity between federal and regional lawmaking. Moreover, under the Constitution the federal legislator is not restricted from regulating this sphere thoroughly. In fact, the vast joint jurisdiction is concurrent, with overwhelming dominance of the federal legislator.

Thirdly, many of the constitutional formulas are quite equivocal and thus subject to various interpretations. Under these circumstances, the residual powers of constituent units of the Russian Federation cannot be shaped accurately. In the broad sense of the formulas that appear in Art. 71 and 72 of the Constitution, they can cover almost all governmental powers, thus leaving little space for exclusive regional jurisdiction.

Given the current situation, it is not the Constitution but the federal laws that actually divide jurisdiction between the Federation and the regions. Due to this mechanism of distribution of powers, at present the latter is symmetrical, in general, as opposed to the period of 1990s, when the said distribution was largely based on bilateral treaties between federal and regional governments (all these treaties were abrogated in 2001–2005). Currently, the only treaty on division of powers is in force, the one concluded in 2007 between the federal government and the government of the Tatarstan Republic. However, it is rather a symbolic document dealing with insignificant issues. Thus, it does not violate the general symmetry in the division of powers.

On the whole, the Constitution of the Russian Federation provides quite a vague conception of distribution of powers between orders of government. Practically relevant allocation of powers should be searched for in the federal laws. These are the Federal Law No. 184-FZ dd. 6 October 1999, "On the General Principles of Organization of Legislative (Representative) and Executive Bodies of Constituent Units of the Russian Federation," and the Federal Law No. 131-FZ dd. 6 October 2003, "On the General Organizational Principles of Local Self-government in the Russian Federation."

The first of the said laws currently enumerates some 110 blocks of powers laying within joint jurisdiction of the Russian Federation and its constituent units that the regional governments are responsible to exercise using their budgetary

funds. This extensive list is being regularly broadened by the federal legislator.

Aside from the powers relating to the listed issues, the regional governments are mandated by special federal laws to exercise extra powers, at the expense of the federal budget. Besides, numerous agreements on delegation of powers have been being concluded between the federal governmental bodies and the executives of specific regions.

Local governments do not legally possess jurisdiction of their own. Their powers (the "issues of local significance"), as listed by the mentioned Federal Law No. 131-FZ dd. 6 October 2003, overlap with the issues that constitutionally distributed between the Federation and the regions (see ▶ Institutional Foundations of Local Self-Government, Russia).

## Financial Autonomy and Integrity

Under the constitutional and legislative provisions, every order of government is financially autonomous. All constituent units of the Russian Federation and almost all municipal entities have their revenue sources, form the budget of their own, decide upon expenditures, etc.

However, the activities, assets, and incomes that are subject to taxation, as well as the types of taxes that should and can be levied by the governments, and even tax rate are defined in the federal tax code. Moreover, supervision of tax collection is currently centralized in Russia. For all levels of government, it is currently performed by a single governmental body, the Federal Tax Service, that has a branched system of offices throughout the country. Besides, a single federal body, the Federal Treasury, is responsible for cash servicing of budget execution for all governments.

Besides, discretional distribution of tax revenues by the federal legislator leads to disparities between the revenues and expenditures of the certain government that should be covered by means of intergovernmental transfers. Despite the measures being taken during the last years aimed at achieving self-sufficiency by the regional and local governments, this issue is still high on the agenda. The mentioned issues contribute to vertical financial interdependence of the governments.

Surprisingly, some issues of purely regional significance can be financed from the federal budget. Namely, despite the federal identity of Russia, all the courts according to Art. 124 of the Constitution of the Russian Federation should be financed from the federal budget. Therefore, justices of the peace (that are considered to be regional justices) are being maintained at the federal expense. However, in defiance of the cited constitutional provisions, the constitutional and statute courts of constituent units of the Russian Federation (see, ▶ Constitutional Law and Public Administration, Russia) are being financed by the regions themselves according to Art. 27, para. 2 of the Federal Constitutional Law No. 1-FKZ dd. 31 December 1996, "On the Judicial System of the Russian Federation."

Finally, the federal legislator had elaborated a system of rules aimed at maintaining financial discipline. At present, regional and local governments are bound with numerous restrictions, violation of which is fraught with serious legal consequences (see ▶ Regional Executives, Russia; ▶ Institutional Foundations of Local Self-Government, Russia).

## Coordination and Interaction by the Federal Government

Interaction between orders of government is provided via various institutions and officials. First of all, the President of the Russian Federation can be named as the central figure that aggregates political interests referring to different levels of government and articulates the synthetic will in decisions of his own and in the bills he proposes to the State Duma of the Federal Assembly (the lower chamber of the federal parliament). Besides, the Constitution authorizes the President to use conciliatory procedures to solve disputes between the governmental bodies of the Russian Federation and of the constituent units of the Russian Federation, as well as between regional

governments (see ▶ Head of the State and Public Administration, Russia).

The chambers of the Federal Assembly (the parliament of the Russian Federation) undoubtedly contribute to coordination between orders of government. The upper chamber of the Federal Assembly, the Council of the Federation, is the institution specially destined for regional representation (see ▶ Federal Government, Russia). The State Duma plays its role in the intergovernmental relations as well. According to Art. 26.4 of the mentioned Federal Law No. 184-FZ dd. 6 October 1999, the bills on the matters within joint jurisdiction of the Federation and the regions (these make up a majority of all bills) shall be forwarded to the legislatures and to the higher executive bodies of all 85 constituent units of the Russian Federation. Thereafter regional governments have 30 days for presenting their responses to the State Duma. In case negative responses come from more than one third of the regional governments (i.e., currently, from 29 regions, at least), the State Duma forms a conciliatory commission. Besides, each bill on the matters within joint jurisdiction that had been passed by the State Duma in the first reading should be circulated to the regional legislatures again. The latter have another 30 days for drafting their amendments to the bill.

The federal executive was not designed to serve for intergovernmental coordination of policy-making activities. However, in different times the Government of the Russian Federation included various officials whose functions were to elaborate policy based on intergovernmental coordination. Since 2013 one of the deputy prime ministers (vice-chairmen of the Government of the Russian Federation) is simultaneously the plenipotentiary representative of the President of the Russian Federation in the Far Eastern Federal District. In 2010–2014 another deputy prime minister hold the position of the plenipotentiary representative of the President in the North Caucasian Federal District.

Besides, several federal ministries responsible for the policy-making based on the regional needs existed in recent years. Until 2014 the Ministry of Regional Development of the Russian Federation (established in 2004) had been being focused on this function. In 2012 the first body specialized on certain area had been established, the Ministry for the Development of the Russian Far East. In 2014 the Ministry of Crimean Affairs (abolished in 2015) and, lately, the Ministry of North Caucasus Affairs were formed.

Within judiciary the Supreme Court of the Russian Federation performs some sort of coordination between levels of government. This body generalizes the judicial practice on both federal and regional levels and provides its interpretation that is mandatory for both federal and regional courts.

## Specialized Coordinating Institutions

The institutions that are specifically destined for enhancing interaction between orders of government are not public authorities in the strict sense. The eldest of such institutions is the State Council of the Russian Federation. It was designed to compensate the regional leaders for their expulsion from the Council of the Federation in 2000 (see ▶ Regional Executives, Russia). It is not mentioned neither in the Constitution of the Russian Federation nor in any federal law. Established by a bylaw – the presidential Decree No. 1602 dd. 1 September 2000, "On the State Council of the Russian Federation" – initially, it comprised of the President of Russia and chief executives of the constituent entities of the Russian Federation (regional governors, presidents, etc.).

The State Council has always been solely a deliberative body with no regulatory or supervisory functions. Still it could be perceived as an assembly of similar officials of federal and regional levels or as a forum where regional leaders would discuss pressing issues with the federal President on equal terms. Informal authority of the State Council was being maintained due to regular discussions of the vital matters. Besides, joint sessions of the Presidium of the State Council (it consists of eight higher officials of constituent entities of the Russian Federation, each representing one federal district) and the

Security Council of the Russian Federation became common.

A concept of the State Council as an assembly of quasi-equals vanished in December 2004, when regional governors and presidents ceased to be popularly elected officials. However, upon the described reversion to popular elections of chief executives of the constituent entities of the Russian Federation in 2012, political weight of the regional leaders became more commensurable to the one of the federal President.

However, an increase of federal representation in the State Council of the Russian Federation had mitigated this effect. In 2012, the makeup of the State Council experienced two consecutive extensions. Both times several federal officials got membership in this advisory body. The Presidential Decree No. 946 dd. 11 July 2012 added the chairmen (unofficially "speakers") of both chambers of the Federal Assembly and faction leaders in the State Duma of the Federal Assembly as new members of the State Council. According to the Decree of the President No. 1153 dd. 10 August 2012, the plenipotentiary representatives of the President of the Russian Federation in the eight federal districts joined the then-current members of the State Council.

A similar body exists for coordination of legislative policies. The resolutions of the Council of Federation of the Federal Assembly of the Russian Federation No. 124-SF dd. 30 May 2012 and the of the State Duma of the Federal Assembly of the Russian Federation No. 484-6 GD dd. 8 June 2012 established the Council of Legislators under the Federal Assembly of the Russian Federation as a consultative and advisory body to the chambers of the Federal Assembly. Its predecessor had a single-chamber affiliation and was titled "The Council on Interaction of the Council of Federation with the Legislative Bodies of Constituent Units of the Russian Federation (the Council of Legislators)." The renovated Council of Legislators consists of the Chairman of the Council of Federation and his first deputy or a regular deputy, the Chairman of the State Duma and his first deputy or a regular deputy, the chairmen of committees of both chambers of the Federal Assembly, and the chairmen of all regional legislatures. The cochairs of the Council of Legislators are the chairmen of the Council of Federation and of the State Duma. The main functions of the Council of Legislators are to coordinate legislative support of division of jurisdiction between levels of government; to improve the mechanisms of parliamentary control; to enhance interaction of the Council of Federation, the State Duma, and the legislative bodies of constituent units of the Russian Federation in legislative process; and to exchange parliamentary experience.

Since 2005 the State Council of the Russian Federation had been replicated in the federal districts. Under the Decree of the President of the Russian Federation No. 337 dd. 24 March 2005, the councils under plenipotentiary representatives of the President of the Russian Federation in the federal districts were established. Each council consists of the higher officials of the constituent units of the Russian Federation within federal district and of the deputy Procurator-General of the Russian Federation. Besides, until abolishment of the federal Ministry of Regional Development in 2014, its representatives used to participate in the councils under the President's plenipotentiary representatives. As contrasted to the State Council of the Russian Federation, the plenipotentiary representatives of the President of the Russian Federation are not qualified as members of these councils, though acting as their chairmen. Like the State Council itself, the councils under the President's plenipotentiary representatives in the federal districts, being formal institutions, elaborate informal decisions (Kabyshev et al. 2009).

Under some of such councils, the boards of legislators (in the Central Federal District, in the Siberian Federal District) had been established. The main purpose of these boards is preparing proposals, as well as expert and analytical support on the legislative matters to the said councils and to the President's plenipotentiary representatives.

Coordination of the local governments' activities had been provided for by the Federal Law No. 131-FZ dd. 6 October 2003. The institutions responsible for such coordination are, primarily,

the all-Russian National Congress of Municipalities (RNCM), established in 2006, and regional councils of municipal entities.

## Conclusions

Under the constitutional and legislative provisions, the Russian Federation appears to have one of the most multilevel governmental systems in the world. Leaving aside the multilevellness of the general government itself, as well as of the regional governments, up to five formally autonomous governments can operate on the same territory: the federal government, the government of the oblast, the government of the autonomous okrug (see ▶ Constitutional Federalism and Public Administration, Russia), the government of the municipal area, and the government of the settlement (see ▶ Institutional Foundations of Local Self-Government, Russia).

However, given the Russian political and administrative practices, the named types of governments should not be regarded as self-standing orders of government. First, the jurisdictions of these governments are so overlapped that the lower governments regularly operate as the upper government. Second, the lower orders of government are financially dependent on the upper ones to a considerable degree. Third, regional and local governments are subject to supervision and assessment by the federal and regional governments, respectively (see ▶ Regional Executives, Russia; ▶ Institutional Foundations of Local Self-Government, Russia).

As a result, despite the formally multilevel pattern of decision-making and implementation and the institutional separateness of governments, the latter actually tend to integrate into a solid federal-regional-municipal system of public administration.

## Definition

Since a single theory or perspective may be inadequate for the organization of healthcare

M

services, an integrated multiperspective approach is needed.

## Introduction

Healthcare is not only a complex sector; it is also multidisciplinary because collaboration among different knowledge streams is required to deliver a good quality of healthcare. Healthcare providers have a responsibility to make sure that the patients are satisfied with the services and they recover with minimal complications. Nowadays, episodic reimbursement methods are increasingly being adopted to ensure that both efficiency and quality are integrated into healthcare services delivery. This is the reason why organization of healthcare services delivery requires a careful thought.

A single theory may not be suitable to answer research questions and develop a better understanding of the conceptual aspects of healthcare delivery. Although there have been efforts by researchers to adopt underpinnings of one or more organizational theories, theory integration is yet to be a trend in healthcare research. Besides, evidence-based management and evidence-based healthcare delivery are yet to be in sync. Uncertainty and the possibility of dealing with the events and problems that have never happened before make organizing or organization of healthcare services a difficult task.

Public healthcare delivery organizations are quite different because their performance is linked to the success of healthcare policy. While public healthcare organizations strive to serve the patients, a political or social narrative also becomes a part of the organization of healthcare services. Therefore, public healthcare organizations ought to consider different ways to organize the delivery of healthcare services.

In order to fill the above gaps in the existing knowledge, this entry seeks to integrate Foucauldian discourse theory and sensemaking for the organization of the delivery of healthcare services by public organizations.

## Foucauldian Discourse Theory

Foucauldian discourse theory is a part of the critical management studies research domain that seeks to challenge the "illusions" created by the mainstream management theory. Critical management theorists not only highlight the weaknesses of mainstream management theories but also oppose the use of the critical management theory for prescriptive purposes. Mainstream management perspectives depict powerful managers as the creators of strategy for profitability and efficiency. Too much power rests in the hands of managers in modern organizations, as they may neglect to recognize the value of their employees' tacit knowledge.

The term "discourse" can be defined as "contextually sensitive" written and spoken language as a part of the interactions among individuals, teams, and organizations to create "knowledge and social/institutional practices" (Candlin et al. 1999, p. 323). Each society has its own version of truth based on the social structures and mechanism that determine the types of discourse it accepts (Foucault 1980). For example, in healthcare, professionals in different fields (e.g., doctors) could exercise power over individuals, described by Foucault (1976, p. 139) as "biopolitics", by virtue of specialized knowledge, regulations, and code of practice (Walton 2012).

In the context of social and cultural practices, discourse underpins how the (a) management doctrines are constituted; (b) business or organizational problems are defined; and (c) solutions are prescribed by the managers. Foucauldian discourse theory represents truth and reality constructed by words, ideas, visual language, norms, customs, social activity, and material practices. It describes the manner in which discourses construct a reality (Rose et al. 2006). Foucault's work includes the study of the social effects of the narrative created by various discourses and institutions. By creating and controlling the objects, these discourses seek to convey truth (Leclercq-Vandelannoitte 2011). For example, while the discourse around the Australian healthcare system conveys the message that it is one of the best systems in the

world (Commonwealth of Australia 2019), appropriateness of care in Australia has been an issue (Runciman et al. 2012).

Power relationships are embedded in discourse. An "individual" is not separate from society and discourse. Discourse is used to exercise power to construct subjectivities. Thus, discourses are rooted in the knowledge they create. The knowledge-power nexus creates supercilious managers. Power constructs reality, objects, and the mechanics of truth. Individual and knowledge both belong to this construction. Organizations are created by subjects, and objects are constructed by discourse. Actions of managers and their relationship with others can be understood in the context of knowledge that is created by power (Knights and Morgan 1991). Foucauldian discourse consists of social and cultural contexts, both at inter and intraorganizational levels, and creates, modifies, and recreates a reality. For example, strategy planning and implementation may be done in consultation with employees and middle-level managers; however, Foucauldian discourse analysis illuminates the circulation of power for the purpose of creating strategy.

## Sensemaking

Sensemaking involves constructing the undiscovered by placing "stimuli into some kind of framework" to grasp, describe, and envisage a situation (Starbuck and Milliken 1988, p. 51). Weick (1995) used sensemaking to construct and discover the unknown by placing stimuli in some kind of thinking structure. Sensemaking helps understand, something that is unknown, by using past experiences and related situations. Healthcare organizations operate in a complex and rapidly changing environment in which old business philosophies, practices, and strategies might not always work. Uncertainties and unknown information are embedded in the healthcare organizations' environment. In other words, sensemaking is used to convert a complex world into a situation that can be clearly explained in words (Weick et al. 2005).

When individuals encounter uncertainty, they seek to gather cues from the environment to make sense of what has happened (Maitlis and Christianson 2014). Thus, sensemaking is an ongoing, active, elusive, changing, social, and easy to surmise process. While sensemaking by an individual seeks to explore the meaning of an event, organizational sensemaking focuses on the relevance of an event for the organization's members (Weick et al. 2005). Sensemaking is not an interpretation of something unknown because it seeks to construct, interpret, create, and discover (Weick 1995).

An organizational actor (e.g., a healthcare worker or professional or manager) may find himself, or herself, in the middle of simultaneously ongoing chaotic activities. An individual's experiences and education enable him or her to notice and bracket those activities or events. After grouping, an individual may describe or explain the experience. Sensemaking is retrospective, as an individual looks into the events or experiences of the past to extrapolate a phenomenon. It seeks to link the abstract with something substantive. Sensemaking is shaped by social factors, as an individual's interactions with others influence how he or she makes sense (or takes an action) out of something uncertain. There is a tension among the sensemaking researchers; while some researchers consider sensemaking episodic, others argue that sensemaking is ongoing or continuous (Maclean et al. 2012; Weick 2008, 2012).

## Discourse and Sensemaking in Healthcare

While using Foucauldian discourse to determine autonomy, choice, option, and power in older patients' decision-making, Hicks et al. (2012) found that patients' decision-making was hamstrung by the expertise (of the healthcare professionals). In a study conducted by Robinson et al. (2013) using Foucauldian discourse, participants with chronic pain conditions rejected a biomedical discourse by explaining their own models of pain and challenged the expertise of the healthcare professionals. Haddara and

**Multiperspective Public Healthcare Services Organization, Table 1** A summary of the theoretical underpinnings

| Criteria | Foucauldian discourse | Sensemaking |
|---|---|---|
| Main contributors | Foucault (1976, 1980) | Weick (1995, 2008, 2012); and Weick et al. (2005) |
| Objectives | To understand truth and reality constructed by words, ideas, visual language, norms, customs, social activity, and material practices | To make sense of uncertain, complex, and unpredicted situations |
| Key themes | Contextually sensitive written and spoken language; circulation of power; and narratives created by discourse | Uncertainties; understanding of the unknown; complex environment; and past experiences |
| Relevance to healthcare | The knowledge-power nexus | Uncertain environment; emergence of previously unknown situations; delivery of healthcare services in chaos |
| Element of organization | Interprofessional collaboration; understanding of patients' needs; patient-centered care; the role of discourse in healthcare delivery | Sensemaking by patients and healthcare professional in uncertain situations |

Lingard (2013, p. 1509) contended that for interprofessional collaboration in healthcare, there are at least two discourses, and each has "its own distinctive truths, objects, and language." The power of discourse cannot be ignored, particularly in healthcare, because of the uneven relationship between healthcare service providers and patients.

Sensemaking has been used in healthcare for different purposes, for example, in the implementation of information systems (Jensen et al. 2009); as a performative, material-discursive practice in healthcare operations (Hultin and Mähring 2017); to understand nurses' attempts to clarify incongruous events created by contradicting logics (Kristiansen et al. 2015); for chronic disease self-management (Mamykina et al. 2015); in the role of conversations between organizational members in successful interventions for quality of care improvements (Jordan et al. 2009); for understanding the recognition, assessment, and management of pain in patients' with dementia (Dowding et al. 2016); and for making decisions by multidisciplinary healthcare team members (Rovio-Johansson and Liff 2012).

Discourse analysis and sensemaking complement each other because, in healthcare, while discourse analysis could be used to understand and improve the relationships (a) between healthcare professionals and patients and (b) among the members of healthcare delivery teams, sensemaking is useful in understanding the events or phenomena arising out of chaos. A summary of the theoretical underpinning of discourse and sensemaking is shown in Table 1.

## Conclusion

Healthcare services delivery has three key components – efficiency, effectiveness, and patient satisfaction. Foucauldian discourse could be instrumental in understanding power and relationships among different healthcare professionals. It could be argued that Foucauldian discourse can facilitate coordination both at inter and intraorganizational levels including health policy formulation and implementation. Sensemaking is useful both at the individual and organizational level. While dealing with uncertainty, healthcare professionals often have to derive meaning of an event by applying their expertise and past experiences. Healthcare organizations too use sensemaking to understand and explain the events that might have an impact on employees and others.

Population ecology theory; Resource-dependence theory; Transaction-cost economics theory

## Definition

Considering the complexity of modern healthcare delivery, it may not be possible to design an efficient healthcare organization by using a single theory. A multitheoretical design of public healthcare services delivery organizations is underpinned by two or more theories.

## Introduction

Healthcare organizations are created by using multidisciplinary knowledge drawn from many disciplines, e.g., economics, sociology, organization theories, political science, public health, and different clinical areas. Modern healthcare organizations adopt evidence-based practices to improve their outcomes, processes, and performance, by deploying multidisciplinary teams of healthcare professionals for patient-centered service delivery. Although a combination of different theories has been used by various healthcare organizations, a collective or integrated multitheoretical perspective is lacking in the modern healthcare organizations.

This entry focuses on four important theories used in healthcare organizations: the resource-dependence theory, institutional theory, population ecology, and transaction-cost economics. Each one of the organization theories discussed provides several elements of healthcare's organization. Healthcare organizations are not merely economic organizations; because of continuous healthcare reforms, healthcare organizations are expected to meet the demands of the population and provide patient-centric, good quality healthcare.

This entry seeks to fill the gaps identified above and contribute to the body of knowledge in several ways. The integration and reconceptualization of organizational theories paves the way to develop a holistic understanding of organizations and organizing. The entry seeks to derive a conceptual understanding of healthcare services delivery organizations from the underpinnings of the theories selected. A public healthcare services delivery organization is one that is owned and controlled by government, and is engaged in providing healthcare directly to patients, such as hospitals and large surgery centers.

The entry has been organized as follows: First, organization theories (resource-dependence theory, institutional theory, population ecology, and transaction-cost economics theory) and their relevance to healthcare have been illuminated. Second, the main themes/elements of the literature reviewed have been summarized. Third, a multitheoretical model of a healthcare services delivery organization has been assembled. Last, the implications for management scholarship, practitioners, and health policy have been highlighted.

The theories selected for this entry and their application to healthcare have been discussed. The key elements of the theories are organized into the following categories: (a) main contributors, (b) objectives, (c) key themes, (d) expected outcomes, (e) criticism, (f) relevance to healthcare, and (g) elements of organization.

## Resource-Dependence Theory

The resource-dependence theory (RDT) illuminates the importance of the internal and external environment for organizations, as the environment can bring both opportunities and threats. The power remains in the hands of those who have access to, and control over, the resources such as material, labor, capital, equipment, and knowledge (Pfeffer and Salancik 1978). Organizations, linked with each other by power relations and resources trade-offs, change the levels of their relationships with other organizations by decreasing or increasing their dependence on the other organizations (Ulrich and Barney 1984). The greater the asymmetry between an organization and the elements of its environment is, the higher the uncertainty will be;

the importance of a resource to the organization depends on how crucial it is for organizational performance (Mick and Shay 2014).

### Resource-Dependence Theory in Healthcare

RDT's applicability to healthcare research is evident by its use in answering a variety of research questions. Nursing care facilities introduced specialty care to maintain an edge over rivals in a highly competitive market (Banaszak-Holl et al. 1996). RDT has been used by nursing homes for total quality management (Weech-Maldonado et al. 2001); the impact of regulation on hospitals (Cook et al. 1983); and analysis of the external environment and its relationship with contract management (Alexander and Morrisey 1989).

## Institutional Theory

Environments, as underpinned by the institutional theory, can influence organizations in two ways. First, they may shape the way an organization engages in the production and delivery of its goods or services. Second, they may shape the social and cultural aspects of an organization to ensure it conforms to the expectations of society. Instead of improving their performance and efficiency, organizations engage in the said conforming behavior to survive, despite the existence of factors that may lead to a prediction of failure under the contingency theory and RDT (Mick and Shay 2014). In essence, the institutional theory adds social legitimacy to the list of resources used to transform inputs into outputs (DiMaggio and Powell 1983). The application of the institutional theory to an organization (e.g., a hospital) would depend on the sources of the pressure applied – regulations, social, or cultural expectations – and the type of pressure.

### Institutional Theory in Healthcare

Since hospitals are subject to institutional pressures to provide healthcare to all, the institutional theory provides an indispensable perspective for healthcare research. The contributions of the institutional theory to healthcare research include pressures for the corporatization of healthcare organizations (Arndt and Bigelow 2006); hospitals' ability to innovate (Yang 2015); symbolic or substantive adoption of technology (Angst et al. 2017); and demand for hospitals to meet the quality as well as the ideological demands of society (White 2000). Hospital leaders need to have the capability, including quality improvement skills, to translate external demands into strategic plans (Burnett et al. 2016).

## Population Ecology Theory

Population ecology theorists, drawing their knowledge from biological theories of natural selection, argue that the environment selects a population of organizations for formation, destruction, and survival. The survival of an organization depends on its position or strength vis-à-vis other organizations in the same field, i.e., its competitors. In other words, social factors and the environment, which are beyond the control of organizations and managers, determine the formation, change, and end of organizations (Aldrich and Ruef 2006; Hannan and Freeman 1989).

### Population Ecology Theory in Healthcare

Driven by the principles of variation, selection, and retention, the population ecology theory can be related to the radical change – the emergence of a patient-centered organization and the disappearance of small physician practices – that the healthcare sector has gone through in the last decade (Mick and Shay 2014). A hospital that is prepared to change itself to meet the demands of its environment by continuously improving the quality of its healthcare is likely to be valued and selected by the environment against others (Shortell and Kaluzny 1994).

## Transaction-Cost Economics

The Transaction-Cost Economics (TCE) theory stands on two assumptions: (a) individuals are

**Multitheoretical Public Healthcare Organization, Table 1** Transaction Cost in Healthcare: Macro- and Micro-level

| Transaction dimension | Key themes | Relevance to healthcare |
|---|---|---|
| *Human dimensions* | | |
| Bounded rationality | Limits on human capacity to absorb, assimilate, and integrate information into decision-making in a meaningful manner | *Macro:* Recertification for continuing clinical education<br>*Micro:* Investment in technology for risk management alerts |
| Opportunism | Propensity of one actor to advance self-interest at the expense of the transaction partner | *Macro:* Regulation and accreditation<br>*Micro:* Internal mechanism for patient privacy and investigation of infractions |
| *Environmental characteristics* | | |
| Asset specificity | Degree to which human, material, and capital inputs can be used for purposes other than originally intended | *Macro:* Clinical specializations, standards of practice, clinical education, and training and licensure<br>*Micro:* Internal staffing, credentialing, and jobs assignments |
| Uncertainty | Unpredictable or unanticipated events that interfere with the ability of one or both parties to fulfill the terms of the transaction | *Macro:* External emergencies<br>*Micro:* Internal emergencies, such as system failure, infection control |

Adapted from Stiles et al. (2001) with modifications

boundedly rational because of the information they have and (b) individuals sometimes engage in opportunistic behavior (Williamson 1975, 1985). TCE deals with the differences in contracting costs and issues, between two equally powerful firms, with significant experience, who hire expert managers to create transactions depending upon their asset specificity, uncertainty/complexity and frequency (Miles 2012; Sanders 2010). Asset specificity can be described as the degree a transaction is dependent on a transaction-specific asset, including both physical and human. TCE underpins the idea that an economic organization tends to have incomplete contracts due to the bounded rationality of individuals (Williamson 1998).

Though all individuals do not engage in opportunistic behavior, it is impossible to identify such behavior *ex ante*, i.e., before entering into a transaction or contract influenced by human factors (bounded rationality and opportunism) and environmental factors, complexity, and uncertainty (Miles 2012). Together with information asymmetry and incomplete information, an optimal government organization can be analyzed only after examining the incentive or disincentive employed to shape the behavior of the state.

### Transaction-Cost Economics in Healthcare

TCE has been used in healthcare research to study the effect of: nurses' staffing on efficiency (Bloom et al. 1997); the redesign of disease management programs (Leeman and Mark 2006); choosing in-house or external patient-safety remedies (Fareed and Mick 2011); and the transaction costs of hospital federations (D'Aunno and Zuckerman 1987). TCE influences the clinical practices, accreditation, regulation, and standards of clinical practice as shown in Table 1.

## A Multitheoretical Model of Public Healthcare Services Delivery Organizations

The resource-dependence theory and population ecology theory use the firm or organization as the main unit for investigation and recognize the significance of their environment for organizations. The transaction-cost economics theory uses contracts and transactions as the fundamental basis for analysis, illuminating the need to minimize transaction costs, from an organization's perspective. The resource-dependence theory seeks to minimize or remove asymmetry between

an organization and the elements of its environment. Organizations adapt to regulation, as well as internal and external pressure to maintain their existence. Organizations, as per the population ecology theory, change according to the environmental demands, to avoid extinction. Under transaction-costs economics, organizations must reduce their transaction costs to remain efficient and competitive.

The theories reviewed in this entry illuminate the following issues: They use a piecemeal approach, such as their control of resources, preparing for internal and external pressures to survive, and reducing their transaction costs, to create an efficient organization. In the absence of empirical data and a hypothesis to test, all ingredients required for new theory building are not present in this entry. However, to investigate the interoperability of these theories, a different method could be used to create a multitheoretical model of healthcare services organizations. Researchers could construct the labels, set a narrative ontology, condense the constructs by abstraction, and create an original and useful story, as per the ideas presented in a review article on the topic of theory building by Shepherd and Suddaby (2017). A summary of the theories discussed in this entry has been presented in Table 2.

## Labeling Constructs

For the sake of clarity, constructs can be defined as extracts (key important points or elements) from the literature reviewed. The key constructs of organization derived from the different theories are summarized in Tables 1 and 2 under the column "*Key Themes*." These constructs are: limits on human capacity to absorb, assimilate, and integrate information into decision-making in a meaningful manner; the propensity of one actor to advance self-interest at the expense of the transaction partner; the degree to which human, material, and capital inputs can be used for purposes other than originally intended; unpredictable or unanticipated events that interfere with the ability of one or both parties to fulfill the terms of the transaction; the internal and external environment; control of resources; organizations' power; resource dependence; conformance to isomorphism; the formation, destruction, and survival of organizations; variation, selection, and retention; bounded rationality; opportunistic behavior; information asymmetry; and transaction costs.

## Narrative Setting: Ontology

The idea of narrative setting revolves around organizing or organization by integrating the underpinnings of the theories reviewed in the context of healthcare, as indicated under the column "*Relevance to Healthcare*" in Table 2. Healthcare organizations deploy or utilize internal and external resources to deliver quality healthcare, subject to their regulation and external environment. Healthcare organizations are expected to meet the expectations of society at-large, as well as their patients. Healthcare organizations have to adhere to the standards of clinical and other healthcare practices and achieve ratings and accreditation to conform to institutional pressures. Multidisciplinary healthcare team members are required to meet the licensing, accreditation, and standards of clinical practices.

## Abstraction

Abstraction refers to a process by which ideas can be refined to get a concrete view of a phenomenon, such as the purpose of healthcare organizations, as shown under the column "*Objectives*" in Table 2. The resource-dependence theory suggests that organizations can maximize their power, based on the resources controlled by them. A research and teaching hospital would have access to the talent and infrastructure to test and adopt new evidence-based clinical practices. Other hospitals may not have access to, or would have difficulty, in competing with research and teaching hospitals. As per the institutional theory, organizational structures and processes conform to normative, coercive, and mimetic isomorphism. A research and teaching hospital is likely to contribute to, and shape, standards of healthcare; other hospitals would eventually conform to the said standards. Similarly, big healthcare organizations have more power (as underpinned by the resource-dependence

**Multitheoretical Public Healthcare Organization, Table 2** A summary of theories

| Criteria | Resource-dependence theory | Institutional theory | Population ecology | Transaction-cost theory |
|---|---|---|---|---|
| Main contributors | Pfeffer and Salancik (1978) | DiMaggio and Powell (1983) | Aldrich and Ruef (2006), Hannan and Freeman (1989) | Williamson (1975), (1985), (1998) |
| Objectives | Organizations maximize their power based on resources they control or have access to | Develop an understanding of how organizational structures and processes conform to normative, coercive, and mimetic isomorphism | Understand the process by which environment selects organizations for survival or destruction | Understand how different characteristics of transactions shape contractual arrangements among organization and individuals |
| Key themes | Internal and external environment; control of resources, organizations' power; and resource dependence | Conformance to isomorphism | Formation, destruction, and survival of organization; and variation, selection, and retention | Bounded rationality; opportunistic behavior; information asymmetry; and transaction costs |
| Expected outcomes | Reduce asymmetry between organization and the elements of its environment | Adapt to regulation, social, and cultural pressures to survive | Evolve as per the demand of the environment | Reduce the transaction costs |
| Criticism | Lesser applicability to mechanistic organizations; long-term application; and weak theoretical predictions | Focus only on organizations not on their deep workings; and too much focus on outcomes | Lack of clarity; and fails to recognize that organizations do, in fact, survive environmental challenges | Terms "transaction" and "efficiency" have not been defined clearly; managers are selfish and opportunistic is a flawed assumption |
| Relevance to healthcare | Healthcare quality; impact of regulation; and ongoing healthcare reforms | Demand for quality healthcare; ideological demands of society; convergence of bureaucracy and institutional theory; hospital ratings; and clinical practices | Health policy; rapidly changing healthcare sector; and utilization of healthcare | Clinical practices; organization design; accreditation; regulation; and standards of clinical practice |
| Elements of organization | Resources, internal and external environment | Regulation, social, and cultural pressures; and outcomes | Environment may destruct an organization | Organizations are transactions between individuals and organizations |

theory) to influence normative, coercive, and memetic isomorphism. The population ecology theory posits that organizations live or die depending on the environment they live or operate in. The transaction-cost theory sees organizations as contractual arrangements among organizations and individuals; therefore, organization in healthcare is simply a web of contractual relationships. Organization in healthcare can be divided into three parts, namely: the purpose of healthcare organizations; their activities; and the expected results or outcomes of their activities, as shown in Fig. 1.

## Compelling Original and Useful Story

The last step in the foregoing discussion, with regard to model building for healthcare services delivery organizations, is an endeavor to discover a phenomenon that is new and was not known previously. First, a healthcare organization would need access to or have control over the available resources to deliver services to patients, as the

**Multitheoretical Public Healthcare Organization, Fig. 1** Anatomy of a public healthcare services delivery organization

importance of resources is dependent on an organization's performance. Second, environments can shape the delivery of services by a healthcare organization and press it to conform to the expectations of society. It is safe to assume that health policy and regulation influence a healthcare organization's behavior and performance. In the context of the population ecology theory, as a result of changes in health policy and regulation, the environment may select an organization for retention or destruction. Last, the agreements among parties (e.g., employees, healthcare professionals, patients, insurance companies, and others who are somehow involved in the activities of an organization, directly or indirectly) are to minimize the transaction costs.

An integrated model of a public healthcare services delivery organization should have four elements, as a minimum, based on the theories reviewed: suitable resources; an ability to leverage the environment's impact both on the performance and delivery of services; fitness to withstand environmental pressures or changes; and an effective mechanism to minimize the transaction costs that arise out of information asymmetry among the various parties. Key aspects for a multitheoretical organization ought to be: to reduce asymmetry between the organization and the elements of its environment; adapt to regulation, social, and cultural pressures to survive; evolve as per the demands of the environment and reduce the transaction

**Multitheoretical Public Healthcare Organization, Fig. 2** A multitheoretical integrated model of a public healthcare services delivery organization

costs as shown under the column "*Expected Outcomes*" in Table 2.

In essence, a healthcare organization would gain power by way of the knowledge and equipment it has; the delivery of healthcare is shaped or facilitated or constrained by regulation, public policy, and society's expectations; an organization can only withstand the environment if it adapts to it; the delivery of healthcare has to be in accordance with the standards of clinical practice; and, an organization delivers healthcare by a contact mechanism in which the parties agree to perform as agreed, while the same organization makes efforts to reduce the transaction cost. The outcomes of organizing or organization in healthcare would include patient satisfaction, efficiency, economic sustainability, patient outcomes, and new knowledge. It is clear that an organization does not have fixed or static components, instead, it evolves, changes, and adapts to its internal and external environments. From a theoretical perspective, a healthcare organization is shown in Fig. 2.

## Conclusion

This entry investigated key elements of a selected group of organizational theories and their relevance to healthcare, with the aim of arriving at a model for a healthcare services delivery organization. The arguments put forward in this entry, to

demonstrate that an explicit implementation of theories, by using an integrative approach advances a holistic understanding of organization, can be summarized as follows:

1. RDT has prompted numerous significant changes in the healthcare sector as the public hospitals strive to do more with the scarce resources available to them. Reimbursement for patient care is based on quality, efficiency, and patient outcomes. Resource dependence and constraints could be opportunities to gain sustainable competitive advantage over competitors.
2. As the hospitals grapple with the challenging task of resource acquisition, retention, and management, regulations and isomorphism put an additional pressure to fall in line with the new regulations, quality standards, and patient expectations. The institutional theory could be a guiding post for the hospitals so that the conforming behavior to survive is avoided, and strategy is rather focused on quality, efficiency, and patient outcomes.
3. Though the population or organizational ecology theory posits only the fittest of all organizations would survive the onslaught of the constantly changing external environment, it does not see a role for the internal environment and structures in evolution of organizations. A temporary reduction in resources could trigger consolidation yielding sustainable improvement in efficiency (Arthur et al. 2017).
4. TCE is a manifestation of economic organization using a contractual approach. In the context of a hospital, a transaction takes place when healthcare services are transferred from a provider to a user. While the internal transaction costs include managing, monitoring, and supply chain management costs, the external transaction costs could be information, bargaining, regulation, and enforcement costs. However, the contracts between hospitals and other parties are incomplete contacts, mainly because hospitals ought not to be looked at as purely economic organizations as it would be awfully hard for the healthcare professionals to adopt an opportunistic behavior due to the constraints of professional code of conduct and regulations. Thus, it is not easy to design organization based on an explicit implementation of TCE alone.

Although the four theories discussed in this entry separately offer a plenty of opportunities to design hospital organizations, such an organization design perhaps would not be complete. If a hospital organization design is based on an explicit and integrated implementation of the four theories, it would be much stronger. This entry offers the following key insights: First, public healthcare services delivery organizations gain prominence, power, and reputation based on the equipment and knowledge they have, as highlighted by accreditations and excellent patient outcomes. Second, healthcare delivery is facilitated or shaped by regulations, public policy, and society's expectations. Third, in order to continue to remain in business, public healthcare services delivery organizations must meet the demands of the changing environment. An organization that is not prepared to adapt to a changing reimbursement or insurance landscape would most likely have difficulty in surviving. Fourth, clinical practice is evidence-based; hence, it is not static. Organizations have to continuously change and follow best practices to deliver quality healthcare services. Fifth, relationships between organizations and others are contracts that are subject to information asymmetry. There would have to be an incentive mechanism to achieve the desired outcomes and minimize transaction costs simultaneously. Last, healthcare service delivery must focus on patient experience, efficiency, economic sustainability and its outcomes, and have a keen desire to improve by using new techniques and knowledge.

The entry highlighted the complexity of issues involved related to healthcare services delivery organizations, therefore, its limitations are obvious and must be highlighted: (a) The idea of having a formal organization structure is missing; (b) a mechanism to design contracts between parties (individuals and organizations) is warranted, (c) although public healthcare services delivery organizations ought to meet the expectations of patients and society, a method or framework for achieving that goal is absent; and (d) no

theory alone is sufficient to serve as a foundation for public healthcare services delivery organizations. It is hoped that the entry will attract the attention of healthcare researchers and theorists to advance this dialogue further.

# Municipal Budgetary Processes

Vincent Reitano
Western Michigan University, Kalamazoo, MI, USA

## Synonyms

Budget; Budgeting

## Definitions

Budgeting: A process that encompasses planning, adoption, implementation, and evaluation.

Budget Model: A format or approach to guide the budget process.

## Introduction

Municipal governments generally follow a budget process that encompasses planning, adoption, implementation, and evaluation. To guide the process, they may select different types of budget models, also referred to as budget formats or approaches (e.g., Grizzle 1986; Reddick 2003), each with different assumptions (Kioko and Marlowe 2016). The use of a particular budget model can have a considerable influence on the way a municipal government makes decisions during the budget process (Kavanagh 2011b).

Municipal governments typically create an operating budget and a capital budget. Operating budgets, as denoted by their title, focus on day-to-day operations, and typically assume an annual time-horizon. Capital budgets, in contrast, focus on the acquisition and maintenance of long-term assets, such as buildings and vehicles that can be used for more than one year. Governments also create a separate capital budget document that may be included in a long-term capital improvement plan. Despite their differences, capital budget decisions can have a financial impact on the operating budget over time (e.g., Bland and Nunn 1992).

Not surprisingly, the municipal budget process does not occur independent of other governmental processes. Instead, budgeting is concomitant with public administration, public policy, and the socio-economic environment that a government operates within (Bartle 2001). Municipal budgeting, therefore, works in relation to other governmental subsystems and the external environment, indicating that municipalities can be open systems (e.g., Gibran and Sekwat 2009; Hendrick 2004).

While open systems theory may provide a pathway forward, theory development in budgeting continues to face the key issue raised by Key (1940): "On what basis shall it be decided to allocate x dollars to activity A instead of activity B." Whether or not budgeting is just an incremental process, as a "theory of nonchange," has also been widely considered (Rubin 2015, p. 26). A variety of budget models, intended for both national and subnational governments, were developed in part to address Key's (1940) question and respond to incrementalism. From zero-based budgeting in the 1970s to participatory budgeting, new models continue to emerge (e.g., Tyer and Willand 1997).

While new budget models continue to be developed, researchers and practitioners have paid increasing attention to the role of fiscal stress and how it influences budgets and decision-making. Various stresses on government revenue sources, such as tax revolts and economic recessions, have moved budgeters to consider cutbacks (e.g., Levine 1978, 1979) and various frameworks for recovery (e.g., Kavanagh 2011a). Underlying the budgetary and financial impacts of fiscal stress is the concern that public service provision be maintained.

Concerns over particular periods of fiscal stress have compelled discussions about fiscal resiliency and sustainability. In response, a longer-term approach to budgeting, not only for the capital budget but also the operating budget, has gained traction (e.g., Kavanagh 2007). Despite these and other developments, empirical evidence still indicates a diffusion of various approaches to budgeting and uses of hybrid budget models (Kavanagh 2011b), alongside lingering questions about financial sustainability based on recent projections (U.S. GAO 2019).

## History of Municipal Budgeting

Over time, municipalities in the United States have adopted different types of budget processes. The history of budgeting, therefore, is replete with examples of reforms to budget processes at different levels of government and in response to different contexts (e.g., Rubin 1993, 1996; Shick 1966; Tyer and Willand 1997). As traced by

Tyer and Willand (1997) and Rubin (1993), budgeting has its roots in the early twentieth century, primarily at the municipal level. Across these developments, Shick (1966) argues there are three distinct developments in budget reform: control, management, and planning.

Local officials and scholars were involved in the development of municipal budgeting and led reforms in the early twentieth century (Rubin 1993). At that time, for example, the New York Bureau of Municipal Research set a pathway forward for early accounting and budgeting reforms (Rubin 1993; Tyer and Willand 1997). Further, an early form of performance budgeting was also conceptualized (Tyer and Willand 1997), and not put into practice until years later at the local level (e.g., Ridley and Simon 1943).

Following early budgeting reform, "the modern debate" on budgeting (Meyers 1996, p. 171) emerged beginning with Key's (1940) seminal article, "The Lack of a Budgetary Theory." As the article title implies, Key (1940) asks a fundamental question regarding budgeting: "On what basis shall it be decided to allocate x dollars to activity A instead of activity B."

Not surprisingly, allocative decisions were rigorously considered by scholars in a variety of fields, including economics and political science. Lewis (1952, p. 44), for example, recommended "to divide available resources into increments and consider which of the alternative uses of each increment would yield the greatest return." Later on, Musgrave's (1959) *The Theory of Public Finance* deemed allocation to be one of the three key branches of public finance, alongside distribution and stabilization. Distribution and stabilization are intended for the central government, whereas allocation will vary in lower levels of government.

The approaches offered by scholars such as Lewis (1952) and Musgrave (1959), however, "were an inviting target for the 'political realists'" (Meyers 1996, p. 173). Essentially, determining allocation through an economic approach to budgeting may have "limits" and not fully reflect the complexity of budget decision-making (Meyers 1996, p. 172). If municipal governments are open systems, then a rational approach may "fail to capture the complexities of public budgeting and yield incomplete theories" (Gibran and Sekwat 2009, p. 617).

Nelson and Balu (2014), for example, demonstrate the difference between the two approaches, specifically rational and open systems, albeit with a focus on special-purpose local governments. Kelly (2005) makes a similar argument about budgeting and concludes that "a theory of budgeting is a theory of political cycles driven by changing public opinion about the proper role of government" (p. 89). These theoretical debates persist to the present day and continue to foster a dialogue around budgeting theory and praxis (Rubin 2015).

## Municipal Budget Models

Kioko and Marlowe (2016, p. 185) make the following observation about the budget process: "Public managers can't control many of the factors that affect their budgets. . .But public managers can control how they make their budgets." For example, municipal managers can't change when a national recession occurs. They can, however, respond strategically through the budget process, to ensure continued public service provision at the local level.

While the municipal budget process may generally proceed through similar steps for each government, from planning, adopting, implementing, and evaluating the budget, there are different models (Kioko and Marlowe 2016), also referred to as formats or approaches (e.g., Grizzle 1986; Reddick 2003). The models range from incremental budgeting to more recent developments such as participatory budgeting, and each has different assumptions about budgeting and the various stakeholders involved in decision-making.

Incremental budgeting, for example, will potentially obviate the aforementioned complexity in budgeting: "this year's budget is based on last year's budget, with special attention given to a narrow range of increases or decreases" (Davis et al. 1966, pp. 529–530). Amidst debates over

incremental budgeting, alternative budget processes emerged. In the 1950s, performance budgeting was introduced, to focus on government activities (Tyer and Willand 1997). Further, "program budgeting was more forward looking while performance budgeting tended to focus on what had been accomplished already," and served as the cornerstone of planning, programming, and budgeting systems (Tyer and Willand 1997, p. 5).

Later on, zero-based and target-based budgeting emerged in the 1970s and 1980s. Zero-based budgeting requires that government agencies or programs submit decision packages that include a considerable amount of information to demonstrate the need for funding. It should be noted, however, that zero-based budgeting does not ensure funding, in contrast to incremental budgeting (e.g., Kavanagh 2011b; Lauth 2014). In contrast, rather than the possibility of a zero-base, target-based budgeting set a target as a percent of a previous budget that must be met (e.g., Kavanagh 2011b).

Empirical evidence indicates that local governments, including municipalities, continue to adopt these budget models in various forms (see, for example, Kavanagh 2011b). In fact, a survey from Kavanagh (2011b) finds that local governments shifted away from line-item and incremental budgets and increased adoption of alternatives such as target and zero-based budgeting, following the Great Recession. Further, consistent with state budgeting research (e.g., Botner 1985; Grizzle 1986; Reddick 2003, 2007), municipalities may select hybrid budget processes (Kavanagh 2011b). A hybrid system may contain elements of different budget models, potentially to reflect the complexity of budgeting. Additionally, practitioners may use hybrid budget models to facilitate budget decision-making for the unique context they work within.

Kavanagh (2011b) and Botner (1985) both used surveys to understand the use of different budget models. Reddick (2002, 2003) considers budget models, also called theories of budget decision-making, in relation to their degree of rationality. Rational choice budgeting, defined as "a *forward-looking process*" is most rational (e.g., zero-based budgeting), followed by incrementalism and then "garbage can" or anarchistic approach to budgeting (see Cohen et al. 1972), which is random (Reddick 2002, p. 2). Reddick (2002, 2003) empirically tests budget decision-making in national governments and US states. At the local level, only Dorta-Velazquez et al. (2010) empirically tests budget decision-making in Spanish municipalities, with evidence of both incremental and rational decision-making, further reinforcing the finding of a hybrid approach to budgeting.

## From Increments to Decrements

As municipal governments began to experience fiscal stress in the 1970s and beyond, the concept of decrements also emerged as another budgeting model (e.g., Behn 1985). As part of a broader literature on cutback management, or cutback budgeting, practitioners and scholars increasingly considered how to cut budgets, with a focus on questions of allocation. Even more recent literature, for example, argues that "an era of cutback management and enhanced interest in government performance. . .will keep the search for a budget theory alive and well" (Frank 2007, p. 228).

Seminal articles from Levine (1978, 1979) detailed cutback management. Levine (1978) created a two-dimensional typology considering the internal versus external and political versus economic factors that cause organizational decline. One of the identified causes of organizational decline in Levine (1978), environmental entropy, is described as "the now familiar phenomena of financially troubled cities and regions" which face "the forced choice of cutting services" (p. 318). In a subsequent article, Levine (1979, p. 180) considered "strategic choices that an organization must make about confronting, planning, targeting, and distributing cuts" (p. 182).

To confront and plan for cuts, organizations can "resist or smooth cuts" which occurs "quite early in the planning process" (Levine 1979, p. 182), potentially via slack resources (e.g., Barrett et al. 2019). To target the cuts,

organizations can pursue decrements of varying sizes, and can cut in a particular area or across the board. Another potential choice focuses on the decision to pursue efficiency or equity when cutting. Over time, a considerable literature has emerged on cutbacks, which has been reviewed comprehensively elsewhere (Raudla et al. 2015).

## Future Developments in Municipal Budgeting

Municipal budgeting research and praxis continues to evolve (e.g., Frank 2007; Rubin 2015). In a retrospective, Rubin (2015) argues that budget research should consider the role of conflict among stakeholders, which relates to prior debates in the literature over the role of politics and even institutions (Meyers 1996). Thus, methods that facilitate stakeholder engagement, including citizens, may continue to gain traction in municipal budgeting, among both researchers and practitioners (e.g., Ebdon and Franklin 2004, 2006).

# Municipal E-Governance in Asia

Aroon P. Manoharan[1], Sean Mossey[1], Haoyu Zhao[1] and Shilpa Viswanath[2]
[1]Department of Public Policy and Public Affairs, John W. McCormack Graduate School of Policy and Global Studies, University of Massachusetts Boston, Boston, MA, USA
[2]Department of Political Science and Public Administration, University of Wisconsin, La Crosse, WI, USA

## Synonyms

Comparative; Digital governance; Digital technology; Global; International and East Asian municipalities; Information technology; Municipal e-governance

## Definitions

E-Governance: The application of information and communication technologies (ICTs) for the provision of public information and services, and to promote participation and democracy.

East Asia: Refers to the eastern region of Asia and comprises of China, Hong Kong, Macau, Taiwan, Japan, Mongolia, North Korea, and South Korea.

## Introduction

Rapid developments in information and communication technology (ICT) applications have created an increasing need for governments at all levels to technologically upgrade and digitize these processes. Increasing expectations from technology-savvy citizens are pushing local governments to open new channels of communication with the public. This entry examines the longitudinal trends in municipal e-governance among Asian municipalities and discusses the advances made in key e-governance categories over a period of 12 years. The entry uses data acquired from a joint study conducted by the E-Governance Institute at Rutgers University-Newark and the McCormack Graduate School at the University of Massachusetts Boston. With local governments across the world becoming increasingly interconnected, this entry presents the latest global and local trends in municipal e-governance and contributes to understanding this phenomenon from an international and comparative perspective.

## Understanding E-Governance Progress

The phenomenon of e-governance refers to "the use of information and communication technologies (ICTs) to support public services, government administration, democratic processes, and relationships among citizens, civil society, the private sector, and the state" (Dawes 2008, p.1). This practice of governance involves promoting democracy through increased political

communication and decentralized flow of public information to citizens (Calista and Melitski 2007). The steady evolution of e-governance as documented by various e-government studies (Layne and Lee 2001; Moon 2002; Manoharan 2013; Ingrams et al. 2018) begins with government agencies developing web portals in an effort to digitize information and make that information publicly accessible, and then moves on to the second stage wherein the government agencies proceed to emulating the private sector's e-commerce model and begin to process online transactions, and finally in the later stages the government agencies engage citizens online in a participatory framework for the purposes of democracy. This progression and evolution of e-governance has been historically monitored by national governments and multilateral agencies such as the United Nations (see the UN E-Government Surveys). Yet, microlevel longitudinal analysis of e-governance trajectories is a rare find in public administration literature.

This research is an effort in assessing the global progress of e-governance at the level of local governments over a period of 12 years. The overarching research question in this entry is to understand the trajectory of e-governance development since the inception of the very first Digital Governance in Municipalities Worldwide Surveys conducted in 2003. Using an expansive data set acquired from the joint study, this entry examines the longitudinal trends in municipal e-governance among Asian municipalities and discusses the advances made in key e-governance categories. Such summary assessment in municipal e-governance is necessary to understand the present and potential policy issues surrounding the practice of e-governance around the world. With governments becoming increasingly interconnected, this entry will contribute to creating awareness of the latest global and local trends, thereby enabling public administrators to pursue better collaboration and coordination in solving global public problems at a local level.

This entry's focus is particularly significant because our analysis indicates that Asian cities have made major progress in efforts to advance their e-governance, compared to cities across the world. This lends itself to the notion that overall e-governance in Asia is approaching worldwide levels and may exceed them in years to come. Recent data from the 2018 United Nations E-Government Survey also finds the progress in e-government development in Asia noticeable. Three of the top ten countries with the highest E-Government Development Index (EGDI) are from the East Asian region (Republic of Korea, Singapore, and Japan). And two thirds of Asian countries (31 out of 47) have above the world average EGDI score of 0.55. This justifies a need to map this phenomenal progression of e-governance in Asia and to deconstruct and analyze the nuances of e-government infrastructure in select Asian municipalities. This entry also marks an important effort in lending a comparative perspective to the study of e-governance in public administration.

## Digital Governance in Municipalities Worldwide Survey

The Digital Governance in Municipalities Worldwide Surveys conducted by the National Center of Public Performance's E-Governance Institute at Rutgers University-Newark focuses on the longitudinal performance of e-governance at the municipal level. The first study was conducted in 2003 and repeated every two years with the latest study conducted in 2015. The survey evaluates the performance of websites of municipalities worldwide based on privacy and security, usability, content, services, and citizen and social engagement, and ranked the cities on a global scale. This entry specifically focuses on the largest cities by population among the top ranked nations, as previous e-governance literature suggests a positive correlation between population size and e-government performance among local governments (Manoharan 2013; Moon 2002).

The survey analyzed the main websites of the top 100 most populated countries worldwide in their native languages in order to capture the full essence of local citizens' perspective of e-governance. Of the 100 cities in the 2015 survey, 97 were found to have websites and were analyzed for the purpose of this entry. The main

state homepage of each city was defined as the official website where information and online services of the city were offered. Any department or agency linked to the main city website was evaluated in the survey. Among these components, the survey applied 18 to 26 measures per component coded on a scale up to 4 points (0,1,2,3) for each measure or as a dichotomy (0,3 or 0,1). To ensure reliability and consistency in measures, the website was evaluated by two evaluators in the native language of the website, and when there was significant variation (+/− 10%), a third evaluator evaluated the website in question. Evaluators were also given explicit instructions regarding what each measure entailed in the survey, and were given examples of each measure throughout the evaluation. Total scores among each component were then scaled to a 20-point value. The maximum score that could be scored by a city would be 20 points for each component, or 100 points overall. Table 1 is sourced from the 2015 Digital Governance in Municipalities Worldwide Survey and further outlines the performance measures.

Of the 100 cities analyzed in the survey, there were 33 cities representing cities with the highest populations worldwide in Asia. Table 2 lists the cities evaluated from Asia in 2015. The table also lists their total e-governance score and their respective score in each of the five components.

## Findings from the Survey: A Longitudinal Perspective

Based on the central research question posed, Table 3 compares the average scores of all the cities with the scores of the Asian cities across the 12 years.

Figure 1 depicts the development in e-governance for Asian cities on a 100-point scale. The findings suggest that Asian cities have improved about 10 points in overall e-governance scores from 2003 to 2015. Figure 2 demonstrates the comparative development of Asian cities and worldwide cities in their e-governance scores, and the findings show several interesting trends. The overall e-governance scores across the world have progressed by approximately 8 points since 2003. Comparatively, the jump has been slightly greater among Asian cities by about 10 points. In addition, the gap between Asian cities and worldwide cities has decreased. In 2003 such a gap was over 5 points, 23.01 for Asian cities compared to 28.49 for worldwide cities. Comparatively, in 2015 this gap was only slightly over 3 points, 33.35 compared for Asian cities compared to 36.57 for worldwide cities.

Figure 3 reflects similar progression among the five categories of e-governance for Asian cities. The category that saw the most significant gain was usability, which improved 3.25 points and is

also the highest category overall. In service and privacy/security, the gains were 2.34 and 1.93 points, respectively. The smallest gains were in the content (1.85 points) and citizen engagement (0.98 points) categories.

Figure 4 benchmarks these trends compared to cities worldwide. In the area of privacy/security, Asia saw smaller gains in its overall score since 2003 and worldwide averages increased by approximately 1 point more. In the area of usability, however, gains were far greater for Asian cities that progressed over 3 points, while worldwide cities progressed by slightly over 1.5 points. Gains were about the same in the area of content, where Asian cities progressed 1.85 points compared to 1.79 points in worldwide cities. Gains

Source: Holzer and Manoharan (2016). Digital Governance in Municipalities Worldwide (2015–2016). *The E-Governance Institute, National Center for Public Performance, School of Public Affairs and Administration, Rutgers University-Newark*, 2015–2016

**Municipal E-Governance in Asia, Fig. 1** Overall e-governance score for 2003 and 2015 in Asian cities

**Municipal E-Governance in Asia, Fig. 2** Comparison of overall e-governance score for 2003 and 2015

were relatively the same in the area of service as well, with 2.34 points for Asian cities compared to 2 points for worldwide cities. While small, gains were also greater in Asian cities for citizen engagement. Scores increased 0.98 points compared to 0.61 for worldwide cities. Overall, gains

**Municipal E-Governance in Asia, Fig. 3** Five component scores of 2003 and 2015 for Asian cities

**Municipal E-Governance in Asia, Fig. 4** Comparison of five component scores for 2003 and 2015

were greater for Asian cities in the areas of usability, content, service, and citizen engagement but not for privacy and security.

Figure 5 demonstrates the longitudinal progression of the e-governance score among Asian cities. As can be seen, the greatest progression happened between the years 2013 and 2015, a gain of 3.25 points. However, while progression was slow from 2003 to 2011, it increased relatively about 6.3 points from 2011 and 2015. Overall, the trend has been upward with no year presenting a lower score then prior years.

Figure 6 illustrates this trend in Asian cities compared to those globally. Several points are of interest in this comparison. First, while there has been an overall increased score in e-governance for cities worldwide, there have been periods of lag where scores dropped among global cities. From 2009 to 2013 global e-governance scores decreased with every study. The 2015 e-governance score for cities worldwide, while much higher at 36.57, was still only 0.64 points higher than the 2009 scores. Overall, Asian cities showed upward progression while worldwide cities showed staggered progression.

Figure 7 also analyzes this progression by e-governance component for Asian cities. Overall, each category saw positive progression. Over the years, the progression was staggered for Asian cities. For privacy/security the highest score was achieved in 2009 at 4.76 but there was a notable drop in 2011 to 3.68. The ending score of 4.42 points, while higher than 2003 levels, has not reached 2009 levels. In usability, the scores for Asian cities dropped from 2005 to 2007, but the category has shown overall progression since

**Municipal E-Governance in Asia, Fig. 5** Longitudinal progression of e-governance for Asian cities

**Municipal E-Governance in Asia, Fig. 6** Comparative longitudinal progression of e-governance

then. For content, there were slight drops from 2003 to 2005 and from 2005 to 2007, but the component has consistently risen since 2007 to its highest levels. In the category of service, scores dropped between 2003 and 2005 and between 2009 and 2011. However, a large gain of nearly 1.5 points occurred from 2015, which gave Asian cities a final score of 6.51. In citizen engagement, scores dropped slightly between 2005 and 2007. That said, the category of citizen engagement has shown upward progression all other years.

Figure 8 reflects the progression of e-governance components worldwide. Several aspects of the distribution are of interest. First, till 2013 cities worldwide possess higher scores in each of the five categories across all years. Only in 2013 do Asian cities achieve a higher score of 3.63 points compared to 3.34 points in citizen engagement. For all other years and scores, cities worldwide possess higher scores. Much like in Asian cities, there is staggered progression among all categories, but with all categories showing overall positive progression.

## Discussion

The findings above show several interesting dynamics regarding the trends of e-governance development in Asia compared to cities globally. Overall, the trends suggest that Asian cities have made significant steps to close the performance gap between their official websites and websites worldwide.

The broader performance in e-governance in Asia has been increasing drastically since 2011. Slower progression prior to this has given way to greater interest in e-governance development in

**Municipal E-Governance in Asia, Fig. 7** Longitudinal progression of five components for Asian cities

these regions. This general upward trend of e-governance suggests that Asian cities have consistently been improving their e-governance efforts, particularly in the past 5 years. Globally however, there have been years of descent in e-governance scores, and from 2009 to 2013, there were drops with every survey. While Asian cities have advanced significantly since 2011, the progress of cities worldwide has been much slower. This lends itself to the notion that overall e-governance in Asia is approaching worldwide levels and may exceed them in years to come.

Further, cities in Asia have continued to focus primarily on usability and providing services online. Despite gains in security and privacy, there has been less emphasis in this area among Asian cities compared to cities worldwide. Finally, positive trends in the area of content indicate that Asian cities are placing more emphasis on dissemination of relevant information and content online.

The major observation from the data is that the East Asian cities exemplify the best-case e-governance scenarios: Shanghai, Seoul, Hong Kong, Singapore, and Tokyo. For instance, Hong Kong, which has a website design very similar to that of New York City, has done a tremendous job of sharing its databases with the public through its "Data.One" portal. Citizens in Hong Kong have access to a range of public data, including geospatial, population, public transportation, water quality, weather, etc. This data enable citizens to both oversee government functions and make better choices in their everyday lives. Hong Kong has also designed many mobile applications for citizens to access information and services more conveniently, and is a leading example of mobile government (m-government) in Asia. The city of Shanghai has recently redesigned its official website with a "single window" system that prioritizes citizens as the main focus of e-government process, and

**Municipal E-Governance in Asia, Fig. 8** Longitudinal progression of five components worldwide

provides a concise, clear, and easy-to-use interface with comprehensive contents. Similarly, Seoul and Singapore both have multiple e-governance initiatives (M-Voting, ETax, GovTech, ECitizen Ideas!, OneInbox) geared toward increasing the usability, accessibility, and citizen participation of the civil society via digital initiatives. The Seoul Metropolitan Government's M-Voting platform is an electronic voting system that enables citizens to express and share opinions on diverse policy issues via smartphones and personal computers. Seoul's Electronic Tax (ETAX) and the Open Tax Court provide an online platform for filing returns, paying taxes, requesting certification documents, and viewing past returns and payment history. Comparably, Singapore's Government Technology Agency (GovTech) plays a vital role in e-government development by developing a wide range of ICT solutions and e-services applications in their government.

## Conclusion

The longitudinal analysis of municipal e-governance demonstrates that while progression among the five components of e-governance have varied over the years, they show an upward progression overall. The trends suggest that cities in Asia, much like many cities worldwide, are moving away from citizen engagement efforts in favor of other components of e-governance. It is widely acknowledged in public administration literature that citizen participation can play an important role in government decision-making processes, helping

governments to be more accountable, transparent, and productive. The East Asian municipalities explored in this entry serve as good examples of how municipal governments are becoming more effective and efficient through public investments in usable, accessible, and interactive websites. This entry expands the conversation on how municipal e-governance can facilitate democracy locally and globally, through the use of digital technologies.

## Synonyms

Strategic use of public procurement in promoting social impact; Sustainable public procurement; Sustainable public strategy

## Definition

Municipal Public Procurement is the mechanism used by governmental organizations purchases products and services to enable the operation of their activities and the provision of services to the population.

## Introduction

The central theme of this entry is the potential of the use of purchasing power, especially in the scope of municipal public power and its impact on sustainable development. It is an exercise of combining operational activities with strategic objectives of public policies propitiating a repercussion in the dynamics of the local society perceived in the sustainable development.

Public procurement is embedded in supply management and represents one of the pillars within a public institution, both operationally and strategically, in view of budgetary and financial resources, according to Batista and De Varge Maldonado (2008). With the insertion of

M

sustainable development in the agenda of governments, mechanisms were adopted to contribute to this demand.

Elkington, in 1997, presented the triple bottom line concept (TBL) that defines the pillars of sustainable development in three dimensions: social, economic and environmental (Beuron 2012). Its proposal is in line with the basic principles listed in the Brundtland Report: economic development, environmental protection and social equity.

Later, Elkington (2013) presents the three historical waves that supported the three dimensions of TBL: social pressure for the creation of mechanisms of environmental protection; the perception that business and the market should make use of technological innovation and the development of new products to ensure economic growth based on sustainable development and globalization and its consequences for the transformation of organizations and services in order to ensure the interests of civil society. Other initiatives have emerged corroborating the concerns raised by the sustainable development debate and pressing governmental organizations to adopt practical measures such as the emergence of ICLEI – Local Governments for Sustainability, Agenda 21 and the Marrakech Process.

The public manager is now driven to rethink spending, combining quality with the optimization of the application of resources and with a systemic view that purchases drive local public policies in three dimensions: social, economic and environmental.

Throughout history, it has been noticed that legal frameworks have sought to modernize management practices to reconcile the application of resources in public policies, public spending and the incentive on development. Complementary Law 123/2006, which establishes the National Statute for MSEs, opened the horizons for the potential of this important segment of companies, the importance of supporting them, their representativeness in the hiring of workers and the economic dynamics of the country. Micro- and small enterprises account for 60% of the country's formal employment, with 14 million jobs, and are responsible for 25% of GDP – Gross Domestic Product (SEBRAE 2014).

The year of 2016 is marked by the beginning of a period of economic recession in Brazil, which urged labor, political and economic reforms. Public purchases in Brazil account for almost 15% of GDP and represent a significant segment in the process of resumption of economic growth, according to Ribeiro and Inácio (2014).

The policies favoring MSEs in public procurement are supported by federal legislation at the level of municipalities. The main benefits are: possibility to participate in the bidding procedures even if their certificates are expired, in case they are winners, they have an additional period to present the regularized documentation; the possibility of using preemptive rights in the event of a fictitious tie with companies of another size and offering lower bid and winning; the preparation of bids made exclusively for MSEs when the contracting is budgeted at up to R $ 80,000.00 (eighty thousand reais); the compulsory allocation of exclusive lot for MSEs in up to 25% of the bidding that aims at the acquisition of common products and services and the subcontracting of up to 30% of biddings that are unviable directly.

The accomplishment of this research is justified by the following findings: (1) public, national and municipal purchases of the state of Ceará have importance and relevance for the economic development and the generation of employment, income, and profits for MSEs entrepreneurs; (2) public purchases, when associated with sustainable development assumptions, both enable the condition of sustainable purchases, and impact on development indicators; and (3) research, with this focus, is necessary to understand and delineate the current context in which government purchases are placed in municipalities and the possible paths for innovation promotions that enable the achievement of new results with a positive impact on sustainable development.

Since 1997, the state of Ceará has had leaders who have adopted the results-based management model, achieving excellence and transforming local dynamics. Between 1987 up to 2017, economic and social changes in the state and in the municipalities could be observed. They reflected in the indicators, especially on education, attractiveness of industries, level of investments,

infrastructure and economic development, even though the share in the National GDP was 2.18% in 2014.

This entry has main purpose to analyze the impacts of policies favoring MSEs on public procurement for sustainable development. Specific objectives are (1) to analyze the impacts of the MSEs favoritism policy on public procurement; and (2) to analyze the impacts of public procurement in the perspective of sustainable development.

## Review of Literature

According to Ribeiro and Inácio Jr. (2014), the public purchasing process is the mechanism used by governmental organizations to contract the supply of goods and services to enable the operation of their activities and the provision of services to the population.

Law 8666, of June 21, 1993, regulates Art. 37, item XXI, of the Federal Constitution establishes rules for bids and contracts of the Public Administration and briefly describes that the bidding is intended to ensure the promotion of sustainable national development.

In addition, Law No. 12,349 of December 15, 2010, which amended Law No. 8666 of June 21, 1993, established the legal guidelines for the strengthening of the national industry and created mechanisms for sustainable national development, through preferential margins for companies, national products and services, as well as through regulation and updating of the law on bids.

The studies of Portilho and Russo (2008) and Betiol et al. (2012) subsidized the analysis of the conceptual framework considered in the municipal public procurement policy and its relation to sustainability. The authors emphasize that the adoption of sustainable purchases is related to social and environmental principles and motivate a good management. These conclusions are related to the sustainable production and consumption (CSP) targets set out in the Marrakech Process, which culminated in the development of a framework of 10-year programs (10YFP) to support regional and national initiatives to accelerate changes and PCS standards.

In 2010, municipal public purchases in Ceará totaled the equivalent of R $ 4.775 billion. From 2010 to 2016, there was an increase of 52.46% in the amount of expenses, reaching a total value of R $ 7.279 billion. On the other hand, analyzing the evolution of MSEs in the same period, it can be observed that in the end of 2010, 150,585 MSEs were chosen as the National Simple. That number reached 375,067 at the end of 2016, according to data from the Federal Revenue Service (2018). Meanwhile, the total amount of suppliers of public purchases, adding up MSEs, individual and other types of companies went from 125,474 in 2010 to 87,183 in 2016.

Nonetheless, there is a growth in the number of suppliers of type MSEs in the period from 2010 to 2016, which increased from 12,129 in 2010, reaching a total of 15,948 in 2016.

Data researched by SEBRAE (2018), observed that municipalities, when using purchasing power, seek to regulate the local legislation to comply with what the law of bidding and the general law of MSEs establishes as benefits in the bidding procedures.

Sustainable development began to form the agenda and debate on the direction of civilizations since the 1970s, when the process of deepening and reflections on the conditions of sustainability and viability of future generations began (Gonçalves 2005).

Elkington (1999) presents sustainable development in a three-dimensional scope: economic, social and environmental, the Triple Bottom Line. According to Mello (2014), the social dimension is concerned with establishing fair actions for workers, partners and society and seeks to analyze the reduction of social inequalities; the economic dimension is related to the increase of production and social wealth; and the environmental dimension analyzes the interaction of processes with the environment without causing permanent damage.

The concern with the social dimension from the commitment to the sustainable development arose from the need to involve the employees and all the means to create the conditions to raise the

quality of life on the environment in which the organizations are inserted, presented by the World Business Council for Sustainable Development (WBCSD), according to Mello (2014).

The bias of the economic dimension in sustainable development has a multidisciplinary approach. In one hand, authors such as Biage and Calado (2015) portray their benefits and connection in the following aspects: reducing the cost of the product life cycle, driving markets for innovative solutions aimed at sustainability, reducing prices by economies of scale, greater access to markets by micro and small enterprises and diversity of suppliers.

Souza (2014) brings the reflection to the need of the efficiency of the economic systems to ensure the increase of GDP, the strengthening of the economy and the effects on the social fabric. The economic aspect of sustainability encompasses the monetary side of the process. The procurement process involves a contract, the product/ service and the financial resource of the operation. The circulation of money has its impacts.

The logic of sustainability, when coupled with an operational practice can potentiate its effects in the locality. That is, if the acquisition is carried out by local suppliers, the local economy is strengthened, since money would not migrate to other cities. Adding to this, if the acquisition is performed from micro vendors, the impact is more significant than hiring from large companies.

The axis of the environmental dimension of sustainable development is possibly the easiest to delineate and understand. This is because of the nature of the concept. It is spontaneous that the relationship between conservation of natural resources and sustainability itself is perceived.

The main concerns that are now at the center of the government debate are related to environmental issues: energy matrix, renewable sources of raw materials, waste treatment, sanitation conditions with a direct impact on public health, changes in the planet's climatic conditions with major natural catastrophes and guarantee of production and food supply to the population.

Biage and Calado (2015) identified benefits when it comes to sustainable public procurement: contribution to overcome environmental challenges, energy efficiency, reduction of greenhouse gas emissions, supply of non-toxic cleaning products, environmental impact of goods and services, reduction of resource use through recycling and reuse.

By making a more practical reading, it is expected that governments can use their purchasing power, to improve the lives of those who are working in the supplier companies, acquire ecologically correct products, spend efficiently to expand service to the most vulnerable people, to support the strengthening of the local economy by making money circulate in the city, to discipline the performance of the supplier companies, to promote the implementation of new indirect businesses and to promote people's living conditions through the use of resources and the correct disposal and treatment of waste.

## Methodology

This entry is quantitative, exploratory and descriptive. The research population was defined by the universe of 184 municipalities in the state of Ceará and categorized into two groups based on the classification made by SEBRAE, in municipalities that implemented or not the general MSEs law.

Data collection was done through the collection of secondary data from 2010 to 2016, publicly available in the Internet provided by the Brazilian Service of Support to Micro and Small Enterprises (SEBRAE), Research and Economic Strategy Institute of Ceará – IPECE, Court of Accounts of the State of Ceará – TCE/CE and Brazilian Institute of Geography and Statistics – IBGE.

The data collected were analyzed using Microsoft Excel software, SPSS IBM® version 2018 trial and R version 3.4.4, using descriptive statistics, panel data, clusters and regression between variables.

## Analysis of Results

Based on the objectives of this research, the results are organized into two blocks aimed at public procurement and sustainable development.

## Impacts of MSEs Policies on Public Procurement

The first part of the analysis was based on the results of the per capita expenditure of the municipalities. This variable presents the average financial volume circulating in the municipalities, which represents the contracting potential.

When the statistical verification of clusters was applied, from the per capita expenditure figures, the formation of three groups was verified. It was attributed to the three groups resulting by type of municipal average per capita expenditure, the denomination of groups of low, middle and high expenses.

Table 1 shows the main municipal expenditure per capita, according to the clusters obtained.

Another aspect observed is the performance comparison within each cluster, between the municipalities that implemented and those that did not implement the general MSEs support law. It is observed that in the period from 2010 to 2013 all the municipalities had a continuous evolution. Only the high expenses of the municipalities that did not implement had a jump in that interval until 2013.

From the year 2013 to 2016, it was observed that the municipalities that implemented the general law presented increasing values. Municipalities that did not implement the general law and that were in the clusters of low and medium expenses had a lower positive evolution than the municipalities of the cluster of high expenses.

The first group called low expenses was constituted by 172 municipalities, including Fortaleza. The second group, entitled average expenses, was composed of 9 municipalities. Finally, the third group, of high expenses, was constituted by Eusebio, São Gonçalo do Amarante and Sobral.

It can be seen that the expenses with free distribution material, tickets and travel expenses, hiring of personnel resulting from outsourcing, consulting service and labor leasing are the ones that have the lowest incidence and representativeness in the global volume of municipal public purchases. In turn, purchases are concentrated in consumer material, hiring of individuals, provision of legal services, works and purchases of equipment and equipment.

In the case of contracting third-party services - individuals, the difference in the amount disbursed between the clusters and the specific fall in the group of high expenses up to the year 2016 is noticed. This type of expense deserves an analysis due to the number of individuals that are contracted and that may rise the contracting of MIE – individual microentrepreneur. In 2016, there were 47,150 people hired.

Expenses with other third-party corporate services are those with the greatest volume of financial resources. They represent the greatest potential for participation of MSEs. They include all types of diversified services, which are not included in other types of expenditure. Highlight for Fortaleza, which in 2016, bought the amount of R $ 1.4 billion.

In view of the results, the types of expenditure that represent the greatest potential of participation of MSEs in their contracting are summarized: consumables, contracting of legal services and acquisition of permanent material.

The next aspect analyzed in relation to the impact of the implementation of the MSEs general law on public procurement deals with the number of suppliers.

There are two verified aspects: the first finding relates to the increasing growth in the historical series observed, on the number of suppliers of

**Municipal Public Procurement: Strategy and Sustainable Development, Table 1** Average municipal expenditure per capita (R$)

| Expenses per capita | 2010 | 2011 | 2012 | 2013 | 2014 | 2015 | 2016 |
|---|---|---|---|---|---|---|---|
| Low expenses | 604.28 | 640.69 | 683.74 | 617.50 | 753.76 | 761.16 | 778.76 |
| Average expenses | 1,008.11 | 947.67 | 1,034.78 | 964.22 | 1,054.56 | 1,204.78 | 1,575.22 |
| High expenses | 991.33 | 1,150.33 | 1,164,67 | 1,320.67 | 1,768.67 | 2,064.67 | 2,176.67 |

Source: Search results based on TCE/CE data (2018)

type MSEs in municipal public purchases, and the second finding is related to the quantity of suppliers in the municipalities that implemented the law.

The data corroborate with the concept that when implementing the mechanisms to increase the participation of MSEs, there is a larger register of suppliers interested in supplying to the Public Authorities and the number of procurement procedures is broadened.

## Impacts of Public Procurement on Sustainable Development

The second specific objective addresses the evaluation of the impacts of public procurement on sustainable development.

## Comparison of the Municipal Development Index of the Municipalities (MDI) that Implemented and Did Not Implement the General Law

The overall evolution of the MDI in clusters has not been shown to be perfectly homogeneous. It was evidenced that the evolution of the MDI showed a significant growth during the period analyzed from 2010 to 2016. Each of the groups illustrated in separate graphs, allows a better segmented verification.

Graph 1 shows the evolution of the MDI in the municipalities of the cluster with low expenses. The graph shows that in the group that did not implement the general law, the values are less dispersed and that in the group that implemented,

**Municipal Public Procurement: Strategy and Sustainable Development, Graph 1** Evolution of the MDI in municipalities with low expenses. (Source: Search results based on IPECE (2018), SEBRAE (2018) and TCE/CE data (2018))

there are a greater number of outliers that had MDI above average.

Graph 2 shows the evolution of the MDI in municipalities with average expenses. The group of municipalities that implemented the general law stood out with values above the parameters of the municipalities that did not.

In Graph 3, it can be seen that the municipalities of the high expenditure cluster are those with the highest MDI values. However, there is a difference in this group. The municipality that did not implement the law, obtained higher performance in MDI than the others.

The following regression results are applied to the selected variables to test the hypothesis related to the second specific objective.

## Results of Regression

The second part of the analysis of the results is focused on the application of methodologies and statistical verifications to confirm or not the fundamental hypotheses of this study. Table 2 presents the results of the applied tests.

In compliance with the first specific objective, where a relationship between public expenditure and the promotion of MSEs is sought, a fixed effects model is reached (reinforced by the Chow, Breusch-Pagan and Hausman tests). As for the $R^2$ of the model, it can be said that it is not high, but due to the number of parameters estimated, it is possible to see that the model has a robustness due to the sample size (1288

observations) Variance Inflation Factor (VIF), a measure used to evaluate multicollinearity, if this value is greater than 4, there are problems of multicollinearity.

The test of the possibility of representing the expenses by the independent variables (Quantity of Suppliers and MSEs) is significant (Test – F). It should be noted that the coefficient of the number of suppliers is inversely proportional to per capita expenditure, which reinforces the strategy of the public purchasing policy with the promotion of MSEs.

## Conclusion

The results presented confirm the positive consequence and the significance of the applicability of the MSEs favoritism on public purchases with reflected effects on the sustainable development of the municipalities, evidencing the difference between the municipalities that implemented and those that did not implement the general law of support to MSEs.

In terms of per capita expenditure, we can see ranges of values that outline the groups' averages, as well as highlighting the municipalities that stand out with a reasonable volume of resources that allow a greater investment capacity and offer of services to their citizens.

It was verified that the municipalities that implemented the general law presented a comparatively higher growth in the volume of expenses per capita, that is, more working capital and greater contracting potential.

It was also observed a greater number of suppliers in the municipalities that implemented the law, this has a reflection on the competitiveness,

economics, and expansion of the number of beneficiaries in the share of the total volume of public purchases.

One of the problems identified was the lack of indicators systematized annually that allows a mathematical and statistical model, to monitor the sustainable development of each municipality in the perspective of this study.

Finally, the last specific objective that sought to analyze the impacts of public procurement in the perspective of sustainable development in the social, economic and environmental dimensions was reached with the demonstration of the statistical analysis and result of the regression that presented a high significance and relation between the data of the purchases and quantitative of MSEs suppliers in relation to MDI and their selected variables of the three dimensions of sustainable development.

## Narcissistic Leadership

Susanne Braun
Durham University Business School, University of Durham, Durham, UK
Ludwig-Maximilians-Universität München, Munich, Germany

### Synonyms

Dark side of leadership; Dark side personality; Implications of narcissism for leadership; Leader narcissism; Narcissistic leaders

### Definition

The concept of narcissistic leadership connects narcissism and approaches to leadership in organizations. Leadership concerns an intentional social influence process with the purpose of driving goal-directed action and interpersonal relationships in organizations (Yukl 2012). Narcissism denotes relatively stable interindividual differences in grandiose views of the self, low empathy and concern for others in interpersonal relationships, and self-regulatory strategies applied to maintain inflated self-views (Campbell et al. 2011). Three constructs are typically distinguished in literature: narcissism as a pathological condition (*narcissistic personality disorder*), narcissism as a subclinical individual difference factor (*trait narcissism*), and *narcissistic leadership*, namely, leaders' actions that are "principally motivated by their own egomaniacal needs and beliefs, superseding the needs and interests of the constituents and institutions they lead" (Rosenthal and Pittinsky 2006, p. 629). The explicit differentiation between leaders' trait narcissism and narcissistic leadership concurs with the concept of trait activation (Tett and Burnett 2003; Tett and Guterman 2000). Traits represent people's behavioral tendencies that will manifest in actual behavior when triggered by relevant situational cues. For example, status symbols are cues that render perceptions of leaders' power over others in the organization more salient. Thus, status symbols may trigger narcissistic leaders' actions for their personal profit at the expense of followers' legitimate interests. This entry reviews theory and empirical evidence related to leaders' trait narcissism as a predictor of leader emergence and leader behavior, narcissistic leadership, and consequences in organizations.

### Introduction

> [. . .] it is narcissists who come closest to our collective image as leaders. [. . .] they have compelling, even gripping, visions for companies, and they have an ability to attract followers. (Maccoby 2004, p. 95)

Scholars have declared leadership to be "the single most important issue in the human sciences" (Hogan and Kaiser 2005, p. 169), thus

A. Farazmand (ed.), *Global Encyclopedia of Public Administration, Public Policy, and Governance*,
https://doi.org/10.1007/978-3-030-66252-3

being a core construct to organizational functioning. People attribute organizational successes or failures to effective or ineffective leadership, invoking the belief that organizations' fate lies in the hands of leaders (Bligh and Schyns 2007). Over the last decade, however, leadership research has broadened its perspective from a predominantly heroic view of leadership to a more differentiated picture, including ineffective forms of leadership (for a meta-analysis of destructive leadership and its outcomes see: Schyns and Schilling 2013).

As the above-stated quote and many vivid accounts from corporate settings exemplify, leadership and narcissism are two closely related concepts – in scholarship and practice. There are two main approaches to link them theoretically: First, leaders' trait narcissism predicts leader emergence and leader behavior. Trait narcissism belongs to the so-called *dark side* leader traits (i.e., socially undesirable, negatively viewed characteristics of leaders), which scholars differentiate from *bright side* leader traits (i.e., socially desirable, positively viewed characteristics of leaders such as conscientiousness, extraversion, or emotional stability; Judge et al. 2009). Second, narcissistic leadership predicts relevant outcomes for individuals, teams, and organizations. From this theoretical perspective, narcissistic leadership belongs to the *dark side of leadership*. It is important to distinguish between leaders' trait narcissism and narcissistic leadership. While trait narcissism is likely to drive narcissistic leadership, it is neither a necessary prerequisite nor is narcissistic leadership an automatic consequence of trait narcissism (Rosenthal and Pittinsky 2006). An evidence-based understanding of leaders' trait narcissism and narcissistic leadership is critical for research and practice because both may put organizational functioning at risk.

The following text first delineates narcissism as a clinical personality disorder and subclinical personality trait. The subsequent section is devoted to trait narcissism as a predictor of leader emergence and leader behavior. Finally, narcissistic leadership and its consequences are outlined.

## Narcissism

Historically, the term narcissism derives from the Greek myth of Narcissus who, paralyzed by the beauty of his own reflection in a pool of water, remained gazing at himself in self-admiration until death. The scholarly interest in narcissism originally stems from Freudian psychoanalysis and has carried on into clinical psychology and psychiatry, social and personality psychology, and organizational psychology. Since scholars look at narcissism through subject-specific lenses, it is necessary to distinguish the main and prevailing theoretical concepts before turning to a more focused view of narcissism in relation to leadership in organizations.

## Narcissistic Personality Disorder

Clinical psychology and psychiatry are concerned with narcissistic personality disorder (NPD), a pathological condition including inflated self-views, strategies to maintain such views, and ignorance of others' needs and interests due to a lack of warmth and empathic concern (Campbell and Baumeister 2006). This pathological form of narcissism results from individuals' extreme, unmanageable needs for validation and admiration from others, aiming at self-enhancing experiences. It causes distress and impairs individuals' day-to-day functioning. Recent conceptualizations of NPD distinguish narcissistic grandiosity and vulnerability as well as overt and covert forms of expression. Narcissistic grandiosity consists of feelings of grandiosity, dominance, and entitlement. Narcissistic vulnerability includes experiences of helplessness, shame, and sensitivity to failure in the face of unrealistically grandiose and fragile self-views. This multidimensional conceptualization of narcissism resonates with current discussions in social and personality psychology as well as organizational psychology.

### Trait Narcissism

The primary theoretical lens through which scholars of social and personality psychology as

well as organizational psychology have looked at narcissism to date is the trait perspective. It considers narcissism as a relatively stable individual difference factor that represents not a pathological condition but rather a subclinical trait. That is, it is seen to exist in all individuals, however, to varying degrees. This conceptualization stands in contrast to the categorical approach of clinical diagnoses. Together with Machiavellianism and psychopathy, trait narcissism forms the so-called *dark triad* of personality (Paulhus and Williams 2002). Campbell et al. (2011) characterize trait narcissism as evolving around three components: inflated views of the self (i.e., seeing oneself as special, feeling entitled to receive preferential treatment), unhealthy interpersonal relationships (i.e., low empathy and concern for others, manipulating and exploiting others), and narcissistic self-regulatory strategies (i.e., enhancing and maintaining inflated self-views).

Factor analyses of the predominant measure of trait narcissism, the Narcissistic Personality Inventory (NPI; Emmons 1984; Raskin and Terry 1988) resulted in four components: exploitativeness/entitlement (i.e., feeling entitled to special treatment), leadership/authority (i.e., the wish and tendency to exert influence and authority), superiority/arrogance (i.e., dominating others and feelings of superiority), and self-absorption/self-admiration (i.e., over-appreciation of oneself and seeing oneself as special). These components clearly accord with grandiose rather than vulnerable narcissism. Recent meta-analytic reviews (Miller and Maples 2011), however, emphasize the need to consider both grandiose and vulnerable narcissism in future research. They revealed unique relations of grandiose and vulnerable narcissism with the established five-factor model of personality (i.e., five personality traits including neuroticism, extraversion, openness to experience, agreeableness, and conscientiousness). Notable differences between grandiose and vulnerable narcissism occurred on four of the five traits, all except for agreeableness, with which both subtypes displayed negative relations (i.e., an antagonistic interpersonal style). Grandiose narcissism relates negatively to neuroticism but positively to extraversion and openness. In contrast, vulnerable narcissism relates positively to neuroticism and negatively to extraversion and conscientiousness (Miller and Maples 2011).

## Trait Narcissism in Organizational Leadership Research

Generally, narcissism as a dark side trait is more likely to have negative than positive implications for organizations. Dark side traits can harm organizational functioning in at least two ways, through their nature (e.g., the destructive intentions of narcissists) and their effects (e.g., the destructive effects of narcissists; Spain et al. 2014). As large meta-analytical examinations reveal, narcissism relates positively to counterproductive work behaviors such as embezzlement, bullying, and aggression. However, in organizational cultures that emphasize duty and loyalty to the collective, individuals with high trait narcissism are less likely to engage in counterproductive work behaviors (O'Boyle et al. 2012). The following two sections summarize theoretical views and hitherto published empirical evidence in response to two questions connecting trait narcissism and leadership. First, are narcissistic individuals more likely to emerge as leaders than non-narcissists? Second, to what extent does leaders' trait narcissism affect leader behavior?

### Trait Narcissism and Leader Emergence

Leader emergence refers to the degree to which others view an individual as a leader (i.e., as "leader-like"). Leader emergence ought to appeal to narcissists because of the visibility and prestige attached to it. Being seen as a leader represents an ideal opportunity for self-enhancement. Indeed, when one thinks of leaders, several individuals come to mind that have been described as narcissists, among them Steve Jobs, Jack Welch, Bill Gates, or Jeff Bezos. An apparent overlap exists between the attributes ascribed to grandiose narcissists and those ascribed to leaders (e.g., self-confidence, extraversion, charisma). Thus, it has been hypothesized that others will be likely to perceive individuals with high trait narcissism as

leaders. Empirical evidence supports this notion. Narcissists are popular at first sight because they produce cues of attractiveness (e.g., flashy and neat dress), competence (e.g., self-assured body movements), interpersonal warmth (e.g., charming facial expression), and humor (e.g., humorous verbal expression; Back et al. 2010). These cues represent prototypical views of leaders. Narcissistic individuals are more likely to emerge as leaders in leaderless groups than non-narcissistic individuals (Nevicka et al. 2011a). Narcissists also display a tendency to ascribe leader-like attributes (e.g., dominant, gregarious, open, intelligent) to themselves, but not to others (Rauthmann 2012).

Outwardly, narcissists appear as charismatic, leader-like figures. However, scholars argue that narcissistic grandiosity only invokes perceptions of *personalized* charisma that empowers leaders, but not their followers (Humphreys et al. 2010). Leaders with personalized charisma put followers at the risk of being exploited. *Socialized* charisma instead incorporates the use of one's power for the good of the collective. Narcissists' self-centeredness, lack of concern for others, and self-aggrandizing strategies stand in contrast to socialized charisma. Indeed, narcissistic leaders produce bold, personalized visions, but not socialized visions (Galvin et al. 2010). In line with these findings, narcissists are seen as charismatic, but do not show individualized consideration for their followers (Khoo and Burch 2008). In essence, while narcissists emerge as leaders, their behavior remains dysfunctional for followers and organizations.

### Trait Narcissism and Leader Behavior

The general behavior of narcissistic leaders (e.g., counterproductive work behavior) is different from narcissistic leadership, the latter of which exclusively concerns leader behavior directed at the constituents that they lead. This section addresses the general behavior that individuals in leadership positions display. Individuals with high trait narcissism see themselves as effective leaders. Their positive self-evaluations stand in contrast to how others evaluate them. Moreover, the positive relationship between leaders' trait narcissism and workplace deviance is stronger for other-ratings than for self-ratings of deviant behavior. Thus, narcissistic leaders perceive their own behavior as less destructive than other organizational stakeholders. Supervisor ratings of task performance do not vary according to leaders' trait narcissism. However, ratings of leaders' contextual performance, that is, actions contributing to positive social and psychological climates in organizations (e.g., helping, respect), decrease with narcissism (Judge et al. 2006).

Furthermore, given the complexity of modern organizations, good decisions are rarely based on the viewpoint of a single individual. Decision-making requires collecting and processing relevant information from multiple perspectives. In this regard, a "narcissistic myopia" has been described (Baumeister and Vohs 2001), indicating narcissists' tendencies to ignore or even discredit opinions running counter to their own views. Recent research suggests that narcissists reject advice not because of overconfidence in their own judgment but because they discount the usefulness of advice from others. Interestingly, this research also implies that narcissists do not increase the use of others' advice even if they are held accountable for subsequent decisions (Kausel et al. 2015).

Empirical evidence further supports the notion that narcissists work for their own financial benefits. In US-American high-tech companies, long-tenured narcissistic CEOs received higher direct compensation (i.e., salary, bonus, stock options) and possessed more share value than long-tenured but less narcissistic CEOs. Also, a more substantial gap occurred between narcissistic CEOs' compensation and the compensation that other members of their top management team received (O'Reilly et al. 2014). For leaders in the public realm, such as politicians, initial evidence suggests that grandiose but not vulnerable narcissists persuade others and thereby win over votes. At the same time, grandiose narcissists are more likely to engage in unethical behaviors (e.g., abuse of power, stealing, bending/breaking rules, cheating on taxes, extramarital affairs; Watts et al. 2013). The following section is concerned with consequences of narcissistic leadership for organizations and their members.

## Consequences of Narcissistic Leadership

Rosenthal and Pittinsky (2006) introduced a behavior-based definition of narcissistic leadership. It is said to occur "when leaders' actions are principally motivated by their own egomaniacal needs and beliefs, superseding the needs and interests of the constituents and institutions they lead" (p. 629). Other authors echo this view of narcissistic leadership as the "exercise of power for strictly personal or selfish ends" (Ouimet 2010, p. 713). Inherent in this view is the differentiation between narcissistic leadership and leaders' trait narcissism. While leaders' trait narcissism is likely to drive narcissistic leadership, it is neither a given prerequisite nor is narcissistic leadership an automatic consequence of leaders' trait narcissism. It is possible that non-narcissists engage in narcissistic leadership, or that leaders with high trait narcissism refrain from narcissistic leadership (Rosenthal and Pittinsky 2006). This view concurs with trait activation theory (Tett and Burnett 2003; Tett and Guterman 2000) and subsequent integrative models (e.g., Hogan and Kaiser 2005), which suggest that leadership mediates the relationship between leader traits and further consequences. Leaders' traits and their actual behavior complement each other. While traits such as narcissism reflect behavioral tendencies, the actual manifestation of leader traits in leadership (e.g., of leader narcissism in narcissistic leadership) is contingent on additional variables (e.g., organizational context, situation, follower traits and behaviors). Accordingly, leadership predicts subsequent outcomes above and beyond leader traits (DeRue et al. 2011).

Meta-analytical results generally suggest that dark side personality traits (e.g., Machiavellianism, psychopathy, narcissism) detract from behaviors related to effective leadership (e.g., decision making/problem solving, achievement orientation, or adaptability/flexibility; Gaddis and Foster 2015). Accordingly, leaders with dispositional tendencies to act in their own interest even at the expense of others will be more likely to engage in destructive leadership (Krasikova et al. 2013). This type of leadership includes volitional engagement in actions that potentially harm organizations and their members as well as harmful methods to exert leadership influence (e.g., aggression, bullying).

Hogan and Kaiser (2005) reframed the question whether narcissistic leadership has "good or bad" consequences for organizations into a bright and dark side model. This model proposes that narcissistic leadership is a mixed blessing because it contributes to positive outcomes (the bright side) and negative outcomes (the dark side). The bright side reflects spontaneous impression formation of people when they are at their best behavior, while the dark side reflects behavior in job-relevant situations in the long run, when people let their guard down. While narcissistic leadership may appear courageous, confident, and charismatic at first sight, it incorporates actions based on a sense of entitlement, which destroys interpersonal relations in the long run. Similarly, in the contextual reinforcement model, Campbell and Campbell (2009) contrast the "emerging zone" (e.g., fixed-term positions, fast-changing environments), in which narcissistic leadership should be effective, with the "enduring zone" (e.g., long-term positions, stable environments), in which narcissistic leadership is likely to damage organizational functioning.

Narcissistic leadership ignores others' contributions and discounts their competence. It incorporates feelings of entitlement to profit from others' performance. Narcissistic CEOs of sport organizations were found to be less likely to show contingent reward leadership or the individualized consideration facet of transformational leadership (Resick et al. 2009). Recent research indicates that followers respond to narcissistic leadership with malicious envy and subsequent counterproductive work behaviors directed at leaders (Braun et al. 2015). Nevertheless, narcissistic leadership appears to include some strategic and visionary qualities. Research confirms positive relations between narcissistic leadership and bold strategic actions (i.e., frequent change in organizational strategy). Narcissistic leadership at the CEO level relates positively to the number and size of organizations' acquisitions, extreme performance

(i.e., big hits or big misses), and fluctuating performance over time (Chatterjee and Hambrick 2007).

Further empirical evidence supports the notion that the boldness component of narcissistic leadership is rooted in unresponsiveness to objective indicators of performance. Generally, individuals are willing to take risky decisions when they are confident in their abilities of doing so. This confidence can be bolstered or dampened by feedback from the external environment, such as performance feedback related to previous decisions (e.g., current firm performance) or social praise (e.g., media reports). For narcissistic leadership, the impact of previous performance on current risk taking is diminished, and the effect of flattering media praise on risk taking increases. Thus, while narcissists in top executive positions seem to respond to positive external views in the media, their leadership is not affected by objective performance information (Chatterjee and Hambrick 2011).

From laboratory research with student samples, insights have been gained into the consequences of narcissistic leadership for the performance of leaders and groups. Narcissistic leadership increases leaders' own task performance when success is rewarded for the entire group rather than individually. These findings support the notion that narcissists perform to gain admiration from others (Nevicka et al. 2011a). In contrast, narcissistic leadership appears to detract from group performance. Task-oriented group interaction decreases, and groups under narcissistic leadership arrive at suboptimal decisions (Nevicka et al. 2011b). Overall, these findings point to the risks of narcissistic leadership for organizational functioning. Therefore, the following two sections discuss important avenues for future engagement of practitioners in organizations and for scholars in the field of narcissistic leadership.

## Implications for Practice

From a practical perspective, organizations need to reflect and advance their strategies to successfully deal with narcissistic leadership. Lubit (2002) recommends that organizations take their hiring and promotion practices as well as performance measurement systems into consideration. Narcissistic leaders charm others and make positive first impressions. Therefore, in addition to personal interviews, background checks and objective measures of previous performance are recommended. Narcissists take bold actions and rely on outward social praise (e.g., social media) rather than objective information (e.g., previous corporate performance). As a consequence, corporate performance fluctuates under narcissistic leadership. In the face of narcissistic leaders' self-centeredness and egomaniacal needs, scholars encourage holding them explicitly accountable for their actions. For example, in addition to performance standards (i.e., *what* should be achieved), this requires procedural standards or organizational fair-play rules (i.e., *how* performance should be achieved) evaluated through peer and supervisor feedback (Ouimet 2010).

A major concern is that narcissistic leadership discounts the importance of employees' wellbeing for organizational functioning. Performance measurement should therefore incorporate not only long-term measures of success but also 360° leadership feedback from employees as a backdrop to promotion and compensation decisions. Alarming results from anonymous, confidential 360° feedback represent an early warning sign and opportunity to address narcissistic leadership. Finally, organizational cultures shaped by higher awareness of narcissistic leadership and its risks, guidelines for ethical behavior, and monitoring of deviant behaviors should counteract the negative consequences of narcissistic leadership (Grijalva and Harms 2014).

## Future Directions

Scholars and practitioners in organizations still know too little about narcissistic leadership. Leadership scholars need to develop and test more differentiated models explaining why and

under which conditions leaders' trait narcissism turns into leadership directed against the legitimate interests and needs of followers and organizations. Scholars suggest future research to look at narcissistic leaders' cognitive processes and how they translate into narcissistic leadership (Keller Hansbrough and Jones 2014): Do narcissists' implicit theories of leadership and followership justify abuse of followers? Are their aggressive outbursts toward followers driven by feelings of superiority, inferiority, or both?

From a theoretical viewpoint, models of self-regulation (e.g., the dynamic self-regulatory model of narcissism; Morf and Rhodewalt 2001) represent a promising avenue to advance the current understanding of narcissistic leadership. This theoretical perspective predicts which self-regulatory strategies link leaders' trait narcissism to narcissistic leadership and subsequent outcomes. It also unravels the paradoxical nature of narcissism: feelings of grandiosity and entitlement on the one hand and constant craving for others' attention and admiration on the other hand. Narcissists employ self-regulatory strategies to maintain and further enhance their inflated self-views (e.g., taking credit for others' achievements, overestimating their intelligence or popularity). If they meet this self-regulatory goal, narcissists develop feelings of pride or excitement. However, if this goal remains unmet, anger and aggression arises, which narcissistic leaders might direct against followers in the form of narcissistic leadership.

In terms of methodological advancements, while the majority of hitherto published studies tested linear relationships between trait narcissism, narcissistic leadership, and outcomes, some of the previous findings indicate more complex, nonlinear relations (Benson and Campbell 2007). Thus, future research could explore the impact of high and low ranges compared to mid ranges of narcissistic leadership on organizational performance, for example. Future research of narcissistic leadership should also make use of advanced research methods (e.g., diary methodology; Ohly et al. 2010) that help unravel the actual dynamics of interactions between leaders, followers, and situational or organizational contexts (e.g., dominance complementarity model; Grijalva and Harms 2014). Necessary methodological advancements also include measures of vulnerable facets of leaders' trait narcissism, and how they translate into narcissistic leadership.

Given narcissists' strong drive to lead and the manifold, most likely disruptive consequences of narcissistic leadership, it is important to ask how the negative sides of narcissistic leadership might be counterbalanced. Preliminary answers to this question have been set forth, for example, the counterbalancing effect of leaders' humility. If leaders are enabled to acknowledge their own limitations and to recognize the valuable contributions of others, this counteracts the toxic side of narcissistic leadership (Owens et al. 2015). However, the interaction of these two seemingly paradoxical sides of leadership – narcissism and humility – needs to be explored in further detail. In particular, it remains unclear how narcissistic leaders get to be humble: Can humility be trained or might leaders learn it from major life events (e.g., death, illness, parenthood)?

Finally, in the face of primarily Western centric views, research of narcissistic leadership would profit from advancements in the form of culture specific models. For example, leaders' trait narcissism appears less likely to translate into narcissistic leadership in collective as compared to individualistic cultures (Grijalva and Harms 2014). The above-stated questions and research gaps warrant further empirical corroboration. Findings from this research will then help organizations to identify means of protecting followers from the abusive or exploitative acts involved in narcissistic leadership.

## Conclusion

To summarize, research in organizations supports the view that leaders' trait narcissism creates particular cognitive frames (i.e., the bolstered ways in which narcissistic leaders

think about themselves and their disregard for others) and motivates predominantly self-directed behavior (i.e., constant striving for self-affirmation and admiration). Trait narcissism fuels leader emergence, such that narcissistic individuals appear "leader-like," as well as leader behavior for self-serving purposes. Leaders' trait narcissism can further turn into narcissistic leadership, motivated by egoistical needs and beliefs, directed against the legitimate interests and needs of those being led. In the face of the detrimental consequences of narcissistic leadership for organizations, scholars and practitioners are challenged to monitor this type of leadership and to develop effective remedies.

## Synonyms

Account legitimating and justifying; Decision-making; Institutional sense-making; Narration of governance

## Definition

Narratives provide legitimacy and justification to create and/or maintain processes, structures, and action in policy-making, a function of governance. They "are constellations of relationships (connected parts) embedded in time and space" (Somers and Gibson 1996, p. 59), through which discourses on governing and governance are convened by institutions and actors. In this sense, narratives are storytelling that provide meaning to policy, to organizations, and to decision-making (Wagenaar 2011). Narratives feed and are fed by ideas that shape the agenda-setting, the choice of instruments, and the enactment of policies (Schmidt 2008). They are made of ideas, principles, values, and taken-for-granted assumptions stemming from discourses.

## Introduction

In Europe, since the early 1990s, governance has replaced the modern governing perspectives on policy-making and implementation and has assumed a central position in the public sector of political decision-making. The shift from governing to governance underlined the relevance of narratives to better understand the role of the state in political regulation and in its relationships with non-state actors. The narrative of governance has assumed a central position in the political coordination of the public sector, to the detriment of the narrative of governing. Governing refers to the actions taken by the governments to politically steer social systems and corresponds to the way modern states regulated and controlled institutions and public administration. In turn, governance is about the coordination of interdependent activities aimed at the pursuit of political goals at the system and/or institutional levels and the rules and mechanisms that frame decision-making structures and processes. The narrative of governance is to legitimize and justify the increasing fragmentation of decision-making and the interdependence between state and non-state actors.

It is through narratives that discourses, "made up of a limited number of statements for which a group of conditions of existence can be defined" (Foucault 1972, p. 117), come to social action. Actually, discourses are not locked up in the constituent elements of a text; rather they are construed – actively and dynamically – in a continuous interaction among the narrator, the audience, and the context they share. For instance, the neoliberal discourse on the nature and the purpose of public administration is translated into governance narratives, such as New Public Management (NPM). Discourses are the ground on which actors' actions and institutional practices find their legitimacy and justification.

The narrative of governance convenes elements from discourses to invest and fix meaning to core concepts of governance and management. Discourses provide repertoires of elements that narratives put together to provide meaning to social and political action. This emphasizes the power of discourses in the transformation of social and political structures and processes and the way governance is conceived. As narratives are construed on the basis of different weights of discursive elements, they are plural, as it is the

case of the NPM or the network governance narrative.

The narratives of governance are about setting political goals and rule systems, both formally and informally, driving values and norms affecting actors and constellations of actors' behaviors and attitudes (Hall and Taylor 1996). Narratives of governance articulate elements of related and often competing discourses to justify and legitimize governance processes and structures. Somers and Gibson (1996) identified different types of narratives – metanarratives, conceptual, ontological, and public – that can be used to understand processes of sensemaking in policy processes. The continuous articulation between different types of narratives displays the leitmotivs of why governments, public administration, and individual actors provide meaning to courses of (in)action.

Metanarratives can be referred to as "master narratives," with terms such as enlightenment, progress, industrialization, and knowledge society embedded in the assumptions of social and political actors. While operating at a presuppositional level, metanarratives are articulated within public narratives grounding the need for public administration to coordinate interdependent political arenas. Conceptual narratives are those used by social scientists and researchers to approach their subjects and methods of research. In this sense, the narratives of governance are conceptual constructs aimed at explaining the coordination of interdependent political arenas and actors. Ontological narratives refer to the individuals' stories, ascribing meaning to their identities, decisions, and actions. In turn, public narratives involve cultural, institutional formations and networks larger than the single individual. Public narratives meld normative and ideological ingredients and "can be linked to specific conceptions and theories regarding the relationship between the state and the society" (Ferlie et al. 2009, p. 13). The narratives of governance are public narratives as they shape the nature and the purposes of public administration. Public narratives articulate with ontological, conceptual, and metanarratives as they assign meaning to a body of shared social and political phenomena.

## State of the Art

Narratives only exist in their articulation and their diversity, and specificities are contingent to the way they combine ideas, principles, values, and taken-for-granted assumptions stemming from discourses. When public narratives articulate with elements of conceptual narratives, they not only explain and legitimize the coordination of interdependent activities and actors but also clarify the diversity of narratives of governance, for example, the NPM, the network governance (NetG), and the new governance (NewG) to mention a few. The differences between these narratives rely on the discursive elements they convene to legitimize their primacy. These elements stem from discourses – e.g., neoliberal discourse and social democratic discourse – on the public good, individuals and groups, and social interests. Discourses compete for hegemony and struggle to fix the meaning of good, effective, and efficient public administration. Hegemonic discourses fix the meaning of concepts and notions and contribute to their normalization or naturalization. However, there is no definite hegemony of discourses, on the one hand, because it is always contingent and, on the other hand, because narratives bring in the struggle between contending discursive elements.

The prevalence of the NPM narrative in Europe has been underlined by researchers on public administration reforms (e.g., Meek 2002; Pollit and Bouckaert 2004; Paradeise et al. 2009). In spite of its theoretical fluidity (Boston 2011), NPM represents the idea that efficiency and effectiveness are to be achieved through management instruments used in the private sector, specifying objectives and emphasizing competition for clients, performance measurement, and the use of markets as instruments of public policies. Its development as a public narrative has increased the technicality of the governance and management instruments and has strengthened and increased the weight of the managerial structures and processes in the European public sectors. However, the hegemony of the NPM narrative in the reform of public administration across Europe cannot be pointed out as the only "cause" of the

ongoing transformations in this area. Actually, a mix of signs and symptoms of NPM and other governance narratives has been underlined, for instance, in the case of higher education reforms (Paradeise et al. 2009).

To understand and illustrate the diversity of governance narratives and their struggle to fix the meaning of governance, it is of importance to look at their discursive elements. These elements in the NPM narrative are visible in assumptions (Klijn 2012) such as:

- Focus on effectiveness and efficiency of performance and value for money
- Primacy of ideas and techniques stemming from the private sector
- Privatization and contracting out of governmental services in order to increase effectiveness and efficiency
- Use of market and/or quasi-market mechanisms to promote competition in public service provision and in developing public policies
- Use of performance indicators and other mechanisms to identify targets and outputs of the government or the services contracted out, shifting the control from ex ante to ex post and promoting the vertical steering of the systems and strong central administrations

The NetG narrative draws on the conceptual narrative of social network theory. Its discursive elements focus on the development of networks, including interorganizational relationships (Keast and Mandell 2014). The NetG narrative underlines the need to build strong interactions involving actors in the decision-making processes and guaranteeing commitment to common goals rather than on the mere achievement of tasks. Under this perspective, external control mechanisms, taking the form of *light touch* systems, reconfigure steering instruments driving a less dominant hierarchical orientation and underlining greater reciprocity of interdependency of society-government relations.

Discursive elements of NewG, which address public problems and pursue public purposes, underline the collaborative nature among a wide array of third parties in addition to government. In approaching public issues, Salamon (2002) identified tensions arising from (a) a focus on governance techniques rather than on state programs, (b) a focus on networks rather than on hierarchy, (c) a shift from public vs private to public plus private, (d) a shift from command and control to negotiation and persuasion, and (e) a shift from management skills to enablement skills. This is an illustration of the struggle to fix the meaning of governance and management. NewG discursive elements emphasize:

- The use of tools or mechanisms that define the set of actors in decision-making processes determining the roles they play
- The focus on organizational networks rather than on hierarchical agencies establishing interdependencies between public agencies and third-party actors
- The replacement of sharp division between public and private spheres assuming collaboration to the detriment of competition
- The role of incentive measures leading to the outcomes envisaged
- The enablement skills required to horizontally engage actors in collaborative settings and bringing together stakeholders for a common purpose

As conceptual narratives, the narratives of governance are aimed at explaining the coordination of interdependent activities and actors, bringing to the fore diverse perspectives. Actually, the NPM narrative can be traced back to public choice theory, underlining the need to decrease the influence of the state in the economy. The common ground of the NetG and NewG is the conceptual narrative of social network theory. In the case of NetG, networks are "equated with a new form of governance arising in situations where high levels of interdependence of organizations and where hierarchical forms of command and control are no longer the most effective methods for policy development or implementation" (Keast 2014, p. 22). In the case of NewG, while emphasizing the role of non-state actors, it underlines that governments "lose ability to exert full control over the

development of their programmes" (Salamon 2002, p. 11).

The exercise of governance, while articulating these discursive elements of the narratives of governance, is reconceptualizing governance itself. The articulation between these elements reflects the struggle to fix the meaning of good or better governance and, consequently, the presence of discursive elements of different narratives. In this sense, discursive elements of the NetG and NewG, while evidencing the existence of mixed signs in particular governance settings, counterbalance the hegemony of the NPM narrative. Governance seen from the narrative lens makes tangible the influence of discursive elements in the transformation of political processes. This is of importance as they are used to elucidate the concepts with which they are related with.

The role played by narration reveals how discursive elements ascribe meaning to governance. In public administration reforms, the meaning of efficiency and effectiveness has been fixed mainly by the elements of the NPM governance narrative. They assume meaning and held together other discursive elements of the narratives associated with management and performance instruments, particularly those borrowed from the private sector organizations. These discursive elements were drawn from neoliberal discourses on social and political regulation based on market mechanisms (Ferlie et al. 1996; Olssen et al. 2004). Another example of the role played by narration can be found in the governance of higher education public sector, where governance and management discursive elements stemming from neoliberal and collegial discourses strive for supremacy, emphasizing either managerial governance or academic self-governance models.

## Future Perspectives

Public narratives of governance articulate and are articulated by conceptual narratives that influence the understanding about the dynamics of macro-, meso-, and micro-political processes. This makes tangible, on the one hand, their influence on public policy-making and, on the other hand, how public administration reforms are legitimated, justified, and enacted. By linking actors, institutions, and their social and political contexts, the narratives of governance are a dynamic and integrative perspective and processes underlining the importance of institutional knowledge and reflexivity.

Governance "acquires meaning through its positioning relative to other signs" (Offe 2009, p. 379). The exercise of governance challenges individual actors and institutions to assume a stance in the process of fixing the meaning and justifying decisions and their enactment. Actually, the narration of governance is becoming the arena where political processes evolve affecting the agenda-setting, the development of policies, and the evaluation of their outcomes. In this sense, the narrative perspective of governance also challenges policy analysis as it emphasizes the role of discursive elements convened by different types of narratives. At the same time, this perspective opens up avenues for future research on the dynamic features of the political process challenging the hegemony, naturalization, and acceptance of taken-for-granted assumptions on policy processes and structures. For that reason, public administration reforms in Europe can hardly be explained on the basis of discursive elements stemming from a sole narrative of governance, thus challenging both the political processes and their analysis.

# National Accounts

Rosa M. Dasí
University of Valencia, Valencia, Spain

## Synonyms

European System of Accounts (ESA); Government financial statistics (GFS); Governmental Accounting; System of National Accounts (SNA)

## Definition

National accounts are a system of accounts and balance sheets that provide an integrated framework to describe an economy (i.e., a region, country, or group of countries), its components, and its relations with other total economies. The System of National Accounts (SNA) is the internationally agreed standard set of recommendations on how to compile measures of economic activity in accordance with established accounting conventions based on economic principles. The recommendations are expressed in terms of a set of concepts, definitions, classifications, and accounting rules that comprise the internationally agreed standard for measuring economic activity. The SNA allows economic data to be compiled and presented in a format that is designed for purposes of economic analysis, decision taking, and policy making (2008 SNA).

In Europe, national accounts are compiled according to the European System of Accounts (ESA 2010), the central framework of reference for the social and economic statistics of the European Union (EU). This system is consistent with international guidelines on national accounting set out in the 2008 SNA. Those guidelines were produced under the joint responsibility of the United Nations (UN), the International Monetary Fund (IMF), the Statistical Office of the European Union (Eurostat), the Organisation for Economic Co-operation and Development (OECD), and the

World Bank. The ESA 2010 is focused on the circumstances and data needs in the EU. As with the 2008 SNA, the ESA 2010 is aligned with the concepts and classifications used in many other social and economic statistics.

## Introduction

National accounts are a system based on common concepts, definitions, classifications, and accounting rules in order to arrive at a consistent, reliable, and comparable quantitative description of an economy. The SNA is a measurement tool adapted to macroeconomic needs, and it provides the conceptual framework required for measuring all aspects of an economy.

The system records economic activities in a structured manner, distinguishing actors belonging to institutional sectors such as households, corporations, and government. The system describes the various transactions or other changes in assets (flows) during a specific period of time as well as the level of stocks.

The main characteristics of the national accounts system are (Eurostat 2014):

- Universality. It is a universal system that takes into account the specific circumstances prevailing in the different economies.
- Transparency. National accounts are transparent and are based on written handbooks and manuals.
- Harmonization. National accounts are harmonized statistics and employ concepts and classifications that are also used for other social and economic statistics (industry, trade, employment statistics, etc.). This alignment enables results to be linked and compared with other main international economic statistics, in particular the IMF Balance of Payments Manual (BPM) or the IMF government finance statistics (GFS).
- Flexibility. The incorporation of satellite accounts into the system offers evidence of its flexibility. Satellite accounts provide a framework, linked to the central accounts, so that attention can be focused on a certain field or aspect of economic and social life. Common examples are satellite accounts for the environment, tourism, or health.

The System of National Accounts may be implemented at different levels of aggregation: at the level of individual economic agents or institutional units (or groups of such units), or institutional sectors, or at the level of the total economy.

The System is built around a sequence of interconnected flow accounts linked to different types of economic activity taking place within a given period of time. Each flow account refers to a different activity as the production or generation, distribution, redistribution, and use of income. Each account introduces a balancing item defined residually as the difference between the total resources and uses registered in the two sides of the account. The sequence of accounts is an articulated whole because the balancing item from one account is the first item in the following account and encapsulates economic constructions of great interest and analytical significance.

The balance sheets that record the values of the stocks of assets and liabilities held by institutional units or sectors at the beginning and end of the period complete this sequence of interconnected flow accounts.

The SNA provides a unique overview of the economy, the major economic stakeholders, and of various economic processes, stocks, and flows. The system records how production is distributed among consumers, corporations, governments, and foreign nations. The SNA shows how income originating in production, as amended by taxes and transfers, flows to these groups and how these flows for consumption, savings, and investment are allocated.

National accounts data is used by governments, economic policy makers, economic modelers and analysts, financial markets, etc. The stakeholders range from the general public to business and from domestic institutions and government entities to international

organizations. As a result, the national accounts are a basic component of macroeconomic statistics that form a basis for economic analysis and policy formulation.

## Uses of National Accounts

National accounts play an important role in society, because they are the main tool of communication and decision-making. The system provides a consistent set of concepts and facts about national economies around the world and serves as a framework for thinking and communicating about national economies and their major components.

All users, whether private or public (administration, international organizations, economists, journalists, households, nonprofit organizations, trade unions, etc.), think and communicate through national concepts, such as economic growth, final consumption expenditure of households, capital formation, government deficit and debt, public subsidies and taxes, and the external position relative to the rest of the world.

Forecasts of national accounts statistics are also available for countries all over the world. In addition, decision-making is affected by national accounts as this is formulated in terms of the SNA.

The SNA can be used to analyze and evaluate:

1. **Monitoring the behavior of the economy**. It provides users coherent, comprehensive, and permanent access to the main macroeconomic indicators, which is useful for monitoring an economy's overall performance, strengths, and weaknesses.
2. **Economic forecasting**. It gives the accounting framework for formulating the equations used in macroeconomic models. From the data series provided, the national accounts indicators can be used to assess the significant parameters which show how the economy behaves and can also be used for predictions.
3. **Central statistical framework** that must be used as the **coordinating framework** for all other statistics so as to obtain consistent definitions and hence data. This is especially true of countries in the early stages of organizing their statistical production.
4. **Macroeconomic analysis and economic policy**. National accounts indicators are used by policy makers to analyze the current situation, identify the main issues, and find a common solution for development.
5. **International comparisons** should be based on national accounts indicators. The performance of one economy as compared to that of another is evaluated by economists, journalists, or other analysts in accordance with the common concepts, definitions, and classifications provided by the SNA.

In Europe, the figures from the ESA framework play a major role in formulating and monitoring social and economic policies for the EU and its member states and are used for:

(a) Monitoring and guiding the euro area macroeconomic and monetary policy making and defining criteria of convergence for the Economic and Monetary Union.
(b) Defining criteria for the Excessive Deficit Procedure (EDP). The Treaty on the Functioning of the European Union (TFEU) obliges EU member states to comply with budgetary discipline by respecting two criteria: a deficit to gross domestic product (GDP) ratio and a debt to GDP ratio not exceeding reference values of 3% and 60%, respectively, as defined in the Protocol on the EDP.
(c) Granting financial support to regions in the EU.
(d) Determining the own resources of the EU budget.

## National Accounts and the Economy

The system of national accounts represents a broad and comprehensive statistical system to describe a national economy and how it works. The system uses data on economic activities to provide a systematic picture of the structure and evolution of a national economy.

A transaction is an economic flow that is an interaction between institutional units (producers and enterprises, consumers and households, financial institutions, government) by mutual agreement or an action within an institutional unit that is useful to treat as a transaction because the unit is operating in two different capacities. Transactions are split into four main groups (ESA 2010, § 1.66):

(a) Transactions in products which describe the origin (domestic output or imports) and use (intermediate consumption, final consumption, capital formation, or exports) of products.
(b) Distributive transactions which describe how value added generated by production is distributed to labor, capital, and government and the redistribution of income and wealth (taxes on income and wealth and other transfers).
(c) Financial transactions which describe the net acquisition of financial assets or the net incurrence of liabilities for each type of financial instrument. Such transactions occur both as counterparts of nonfinancial transactions and as transactions involving only financial instruments.
(d) Transactions not included in the three groups above: acquisitions less disposals of nonproduced nonfinancial assets.

The concept of national accounts provides a substantial contribution to the quality, stability, neutrality, and international comparability of the economic system and describes transactions in national economies and the links between different national economies. The national accounts concept is based on the need to understand and compare different systems within the economy: business accounting, production, employment, productivity, monetary policy, inflation, fiscal policy, public finance, personal income, wealth and consumption, balance of payments, etc.

These different systems describe different aspects of the economy, and national accounts combine these systems into a single accounting framework. As a result, the SNA provides an overview of each of these specific aspects and can also show all interactions between them and within the national economy as a whole.

## Historical Evolution of National Accounts

As stated in the introduction to the SNA 1993, the official interest in the comparability of economic statistics dates back at least to 1928. In that year, the League of Nations, the first international organization whose principal mission was to maintain world peace, held an International Conference on Economic Statistics in order to stimulate the development of this kind of statistics and the adoption of uniform methods of presentation. The Final Act of the Conference stated that international comparability should be a goal, especially between countries with sophisticated statistical systems. It urged countries to consider extending the scope of official statistics in order to facilitate the preparation of estimates of national income at regular intervals. Work on national income received a boost as a result of the Great Depression of the 1930s, on the one hand, and the evolution of macroeconomic theory, on the other.

After the Second World War, there was an immediate need for comparable measures of national income as a basis for the distribution of the costs of international organizations. To meet this need, the Subcommittee on National Income Statistics Committee of Statistical Experts of the League of Nations was created. Consisting primarily of experts who were engaged in the development of estimates of national income in certain countries in Europe, North America, and Australia, the Subcommittee met in December 1945.

The origins of SNA date back to the Subcommittee report, published in 1947. The Subcommittee expected that the guidelines and recommendations in the report would be applied to the widest possible extent in each country in the computation of national income and related accounts in order to secure higher international comparability than in the past. As a result, the

early postwar years saw a transition to regularized statistics among countries.

By 1950, the Statistical Office of the United Nations was able to assemble estimates for National Income Statistics, 1938–1948, for several years from 41 countries based on national sources.

In Europe, national accounts provided a framework for the information concerning the conditions and economic performance that was used to administer postwar aid and encourage economic growth. The Organisation for European Economic Co-operation (OEEC) in 1950 published a set of accounts prepared by its National Accounts Research Unit, a unit set up to promote the comparability of national accounts statistics among member countries. This set of accounts was used to develop a series of country studies, and this experience was the basis for the publication in 1952 of "A Standardized System of National Accounts."

Meanwhile, the Statistical Commission of the United Nations recommended continued work to achieve a uniform reporting basis for the largest number of United Nations members, and the result was based on the 1953 report "A System of National Accounts and Supporting Tables."

The 1953 report recognized the importance of bringing the different international statistical standards into agreement. Specifically, it recognized that the international guidelines on economic and financial statistics and on national accounts should be consistent and well integrated. It noted the care that had been taken in drawing up the SNA to ensure consistency with definitions and classifications used or recommended by others, notably the International Monetary Fund, on international transactions and the OEEC. The first chapter of the 1953 report dealt was on the development and uses of national accounting. The most important use of national accounting statistics had been linked to public policy. In 1968, the Statistical Commission approved a revised SNA.

The first European System of Accounts was published in 1970 (ESA 70) and was the result of work carried out under the sole responsibility of the Statistical Office of the European Union (Eurostat), in collaboration with the statistical offices of the member states, and was the community version of the SNA 68. This system was partially revised and published in 1979 as a second edition of the original system (79 or ESA 79 second edition).

Since the mid-80s, Eurostat collaborated under the Interdepartmental Working Group on National Accounts of the UN, in the preparatory work for the revision of the SNA 68, and culminated in the development of the new SCN in 1993.

Similarly, a review of the ESA (70/79) was initiated by a group including the European Commission and experts from the National Statistical Institutes of the member states. At the Economic and Financial Affairs (ECOFIN) Council meeting in November 1995, the green light was given to the regulation of the Council of the EU on the European System of National and Regional Accounts (ESA 95).

Today has conducted a new review of international national accounting methodologies that culminated with the publication, in 2009, of the SNA in its 2008 version, as well as the recent adoption of the ESA 2010. As in previous methodological changes, the objective is to update and improve accounting measurement systems, adapting it to the changing economic phenomena that it measures (Fig. 1).

## The European System of Accounts ESA 2010

In Europe, national accounts are compiled separately by each EU member state, more specifically by the national statistical office or another institution appointed by the government, according to the ESA 2010. European national accounts are compiled by the Statistical Office of the European Union (Eurostat) by combining member states' national accounts according to a fixed transmission timetable.

The ESA 2010 is the newest internationally compatible EU national accounts framework. The new system was published in the Official Journal of the European Union on 26 June 2013 and was implemented in September 2014, replacing ESA 95. The ESA 2010 is focused on

**National Accounts, Fig. 1** Historic versions of the systems of national accounts. (Source: Author)

the circumstances and data needs in the EU and is a legal requirement for all EU member states. Consequently, all national accounts data, including government deficit and debt data, must be compiled and reported on this basis.

This is the European version of the international guidelines 2008 SNA which are being introduced worldwide. Nevertheless, there are several differences between the ESA 2010 and the 2008 SNA due mainly to differences in presentation and more specific and precise concepts in ESA 2010 than in 2008 SNA. However, both systems are in agreement with the concepts and classifications used in many other social and economic statistics and which play an important role in formulating and monitoring the social and economic policies.

The main characteristics of the system are:

- Institutional units and sectors
- The system of accounts and the aggregates
- The input-output framework

## Institutional Units and Sectors

Institutional units are economic entities that are capable of owning goods and assets, of incurring liabilities and of engaging in economic activities and transactions with other units in their own right. For the purposes of the ESA 2010 system, the institutional units are grouped together into five mutually exclusive domestic institutional sectors:

(a) Nonfinancial corporations
(b) Financial corporations
(c) General government
(d) Households
(e) Nonprofit institutions serving households

The five sectors together make up the total domestic economy. Each sector is also divided into subsectors. The ESA 2010 system enables a complete set of flow accounts and balance sheets to be compiled for each sector, and subsector, as well as for the total economy. Nonresident units

can interact with these five domestic sectors, and the interactions are shown between the five domestic sectors and a sixth institutional sector: the rest of the world sector.

## The System of Accounts and the Aggregates

### Rules of Accounting

An account records changes in value accruing to a unit or sector according to the nature of the economic flows shown in the account. It is a table with two columns. The current accounts are those which show production, generation and allocation of income, distribution and redistribution of income, and its use. The accumulation accounts are the capital and financial accounts and the other changes in volume accounts (ESA 2010, § 1.88).

### Terminology for the Two Sides of the Accounts

The ESA 2010 system shows "resources" on the right side of the current accounts where transactions appear which add to the economic value of a unit or a sector. The left side of the accounts shows "uses" – transactions that reduce the economic value. The right side of the accumulation accounts shows "changes in liabilities and net worth," and the left side shows "changes in assets." Balance sheets are presented with "liabilities and net worth" (the difference between assets and liabilities) on the right side and "assets" on the left. Comparison of two successive balance sheets shows changes in liabilities and net worth and changes in assets (ESA 2010, § 1.89).

### Double Entry/Quadruple Entry

For a unit or sector, national accounting is based on the principle of double entry. Each transaction shall be recorded twice, once as a resource (or a change in liabilities) and once as a use (or a change in assets). The total of transactions recorded as resources or changes in liabilities and the total of transactions recorded as uses or changes in assets must be equal, thus permitting a check on the consistency of the accounts (ESA 2010, § 1.91).

National accounts shall be based on a principle of quadruple entry, since most transactions involve two institutional units. Each transaction shall be recorded twice by the two transactors involved. For example, a social benefit in cash paid by a government unit to a household is recorded in the accounts of government as a use under transfers and a negative acquisition of assets under currency and deposits; in the accounts of the household sector, it is recorded as a resource under transfers and an acquisition of assets under currency and deposits (ESA 2010, § 1.92).

### Valuation and Time of Recording

With the exception of some variables concerning population and labor, the ESA 2010 system shows all flows and stocks in monetary terms. Flows and stocks shall be measured according to their exchange value, i.e., the value at which flows and stocks are in fact, or could be, exchanged for cash. Market prices are, thus, the ESA's reference for valuation (ESA 2010, § 1.94).

In addition, flows shall be recorded on an accrual basis, that is, when economic value is created, transformed, or extinguished or when claims and obligations arise, are transformed, or are canceled. Output is recorded when produced and not when paid for by a purchaser. The sale of an asset is recorded when the asset changes hands, not when the corresponding payment is made. Interest is recorded in the accounting period when it accrues, regardless of whether or not it is paid in that period. Recording on an accrual basis applies to all flows, monetary as well as non-monetary and intra-unit as well as flows between units (ESA 2010, § 1.101–102).

### The Sequence of Accounts

The ESA 2010 system is built around a sequence of interconnected accounts. The full sequence of accounts for the institutional units and sectors is composed of current accounts, accumulation accounts, and balance sheets (ESA 2010, § 1.113).

Current accounts deal with the production, generation, distribution, and redistribution of income and the use of such income in the form of final consumption. Accumulation accounts cover changes in assets and liabilities and changes in net worth (the difference for any institutional unit or group of units between its assets and

**National Accounts, Fig. 2** The sequence of non financial accounts (Source: ESA 2010)

N

liabilities). Balance sheets present stocks of assets and liabilities and net worth (ESA 2010, § 1.114) (Fig. 2).

The first account in the sequence is the production account, which records the output and inputs of the production process, leaving value added as the balancing item (ESA 2010, § 1.119–1.126).

The value added is taken forward to the next account which is the generation of income account. This leaves operating surplus or mixed income as the balancing item.

The value added, broken down between compensation of employees, taxes, and operating surplus/mixed income, is taken forward with this breakdown to the allocation of primary income account. The breakdown allows the allocation of each factor income to the receiving sector, as opposed to the producing sector. Also recorded in this account are the property income flows into the sector, and those out of the sector, so that the balancing item is the balance of primary incomes flowing into the sector.

The next account records redistribution of these incomes through transfers – the secondary distribution of income account. The major instruments of redistribution are government taxes on, and social benefits for, the household sector. The balancing item is disposable income.

The main sequence of core accounts carries on to the use of a disposable income account, an account relevant to the household sector, as it is here that household final expenditure is recorded, leaving household saving as the balancing item.

At the same time, a parallel account is created, the redistribution of income in kind account. This account has the specific purpose of showing social transfers in kind as an imputed transfer from government to the household sector, so that household income can rise by the value of individual government services. In the next account (use of

adjusted disposable income account), the household use of disposable income is increased by the same amount, as if the household sector were buying the individual services provided by government. Those two imputations cancel out, so that the balancing item is saving, identical to saving in the main sequence of accounts.

Saving is taken on to the capital account where it is used to fund capital formation, allowing for capital transfers in and out of the sectors. Underspending or overspending on the acquisition of real assets results in the balancing item net lending or borrowing. Net lending is a surplus loaned out, and net borrowing is the financing of a deficit.

Finally, the financial accounts are joined so that the detailed lending and borrowing of each sector is laid out so that a balancing item of net lending or borrowing is observed. This should exactly match the net lending/borrowing balancing item of the capital account, and any difference must be a measurement discrepancy between the real and financial recordings of economic activity.

### The Input–Output Framework

The input–output (I–O) framework brings together components of gross value added (GVA), industry inputs and outputs, product supply and demand, and the composition of uses and resources across institutional sectors for the economy. This framework breaks the economy down to display transactions of all goods and services between industries and final consumers for a single period (ESA 2010, 1.136). Information may be presented in two ways:

(a) Supply and use tables
(b) Symmetric input–output tables

## The Government Accounts in ESA 2010

In ESA 2010, the activities of government are presented separately from the rest of the economy in chapter 20 "Organizational Consultation" because, as ESA recognizes, the powers, motivation, and functions of government are different from those of other sectors. This chapter presents government sector accounts and a government finance statistics (GFS) presentation that gives an integrated picture of government economic activities: revenue, expenditure, deficit/surplus, financing, other economic flows, and balance sheet.

It is divided into four sections:

- Section I "Defining the general government sector" gives the delimitation of general government, taking into account their competencies and economic functions. Governments have powers to raise taxes and other compulsory levies and to pass laws affecting the behavior of economic units. Their principal function is to provide goods and services to the community and to households on a non-market basis and to redistribute income and wealth.
- Section II "The government finance presentation of statistics" gives the presentation of the government finance statistics (GFS). The GFS presentation of general government economic activities presents the usual sequence of accounts in a manner that is more suitable for government finance analysts and policy makers. The GFS presentation uses aggregates and balancing items defined in terms of ESA concepts, definitions, classifications, and accounting rules so that they are measured consistently with other macroeconomic variables and with the same measures in other countries.
- Section III "Accounting issues relating to general government" gives additional rules on some more difficult issues of classification and measurement for the general government sector.
- Section IV "The public sector" introduces the notion of public sector.

Another key instrument in national government accounts in Europe, and an indispensable complement to ESA 2010, is the Manual on Government Deficit and Debt (2014) published by Eurostat in order to ensure proper implementation of the ESA conceptual framework for reliable and

comparable statistics across the EU. The Manual provides guidance on the appropriate treatment of statistical issues raised in the EU regarding government financial statistics.

**The Government Finance Presentation of Statistics**

As ESA 2010 recognizes, experience has shown that for government, an alternative presentation to the ESA sequence of accounts in the central framework is better suited to certain analytical requirements. This alternative is known as the government finance statistics (GFS) presentation. It gives a different but still integrated picture of government accounts with the following measures of government economic activity: revenue, expenditure, deficit/surplus, financing, other economic flows, and balance sheet levels.

The ESA-based government finance statistics presentation consists of transactions recorded in the various ESA current accounts, capital account, and financial account, rearranged for nonfinancial transactions into a single account presentation more appropriate to fiscal analysis.

In the GFS system, revenue is defined as the aggregate of all transactions recorded under positive resources in the ESA central framework and subsidies receivable in the current accounts as well as capital transfers receivable recorded in the capital account. Expenditure is an aggregate of all transactions recorded under positive uses and under subsidies payable in the current accounts as well as capital expenditure (gross capital formation plus capital transfers payable) recorded in the capital account. These measures of revenue and expenditure are specific to the government finance statistics presentation, but the underlying transactions are those of the ESA.

The difference between revenue and expenditure, equivalent to the surplus/deficit, is the net lending/net borrowing (B.9). It is equal to the balancing item of the capital account (B.9 N) in the ESA accounts. It represents the amount the government has available to lend or must borrow to finance its nonfinancial operations. The term "net lending/net borrowing" is a sort of terminological shortcut. When the variable is positive (meaning that it shows a financing capacity), it should be called net lending (+); when it is negative (meaning that it shows a borrowing need), it should be called net borrowing(−) (Fig. 3).

**National Accounts, Fig. 3** Government finance statistics presentation (Source: ESA 2010)

In contrast to many other regions of the world, the GFS have a great impact on the EU public because they are used directly in the decisions of European political and fiscal control, and in the absence of harmonized rules of public accounting, they have become a common standard of public accounting.

## Conclusion

National accounts are an essential instrument for evaluating, analyzing, and forecasting economic phenomena because they measure what needs to be developed and highlight the size and structure of the economy and all its components.

The worldwide guidelines on national accounting are set out in the 2008 SNA. In Europe, national accounts are compiled according to the ESA 2010, the central framework of reference for the social and economic statistics of the EU, and it is consistent with the 2008 SNA. Also, both systems incorporate the same concepts and classifications used in many other social and economic statistics and play a main role in formulating and monitoring the social and economic policies.

# National and Local Governments Relationship in Bangladesh

Mohammad Rafiqul Islam Talukdar
Government and Politics, Asian University of Bangladesh, Dhaka, Bangladesh

## Synonyms

Balance of power; Bangladesh perspective; Central government; Inter-relation; Local government institutions; National government; Sub-national government

## Definition

National and local governments relationship in Bangladesh refers to the interrelationship and balance of power between the national or central government and sub-national or local government institutions on the perspective of Bangladesh.

## Introduction

The paramount importance of good local governance and thus call for a robust local government system are explicitly supported by the most of contemporary literatures in the domain of decentralization and local governance. This is not the argument point of the current research. Rather by this research, two uniform requirements could be set forth for a robust local government system to be placed anywhere: build balance of power between the local government and the national government as well as the legislative body; and strengthen the inherent links between and/or among the local government institutions and their departments.

While the lateral part of the requirements is supported by some recent studies (for instance, Talukdar 2014; Ahmed 2016), the current round study, on its ground, tests the validity of the first requirement in connection with the national-local relationship, local governance process, and

balance of power in Bangladesh and by meticulously examining the following concerns. Whether or to what extent the balance of power matters for the local governance and its pro-people service delivery in Bangladesh? Whether the constitutional spirit in relation to central-local balance of power helps boost up the local governance in Bangladesh? Considering the practical sense, how far Bangladesh is away from an equitable balance of power arrangement between national and local governments? To what extent the relationship of national and local governments affects other important relationships, for instance, relationship of legislators and elected representatives of the local governments, and relationship of local bureaucrats and elected representatives of the same local governments?

## Contextual Analysis

The Constitution, formulated immediately after the independence, equally lauded for democracy, decentralization, and local governance system in Bangladesh, but none of those aspects of the Constitution has reached into sustainable norm over the span of a long period. Even though strengthening local government institutions is imperative here, in true sense, it has been strained for years just at academic works, reform objectives, and bureaucratic dilemma.

Local government reforms in Bangladesh advanced very distinctly according to the needs of the ruling elites (Westergaard 2000; Khan and Hussain 2001). According to Aminuzzaman (2010), with the changes of governments, the policy agenda of local government is also being kept changing. Table 1 shows the status of the local government in state organs, while Table 2 shows the forms of local government institutions in Bangladesh.

Table 1 demonstrates that there are three organs of the state, while the local government falls under the executive organ of the same.

Table 2 displays that there are a total 11 city corporations, 323 municipalities (out of which 3 are in the hill area), 61 Zila Parishad/district councils, 490 Upazila Parishads/sub-districts (out of which 25 are in the hill area), 4553 Union Parishads (out of which 118 are in the hill area), 1 hill regional council, 3 hill district councils, 3 traditional Raja, and 472 headman-karbari under the local government structure in Bangladesh.

## Study Methodology

This is a conceptual paper, developed based on a narrative and analytical research, followed by applied research techniques *focused synthesis* and *participant observations.*

> *Focused Synthesis* allows collecting and documenting information as well as data from a range of sources *as diverse literature review, researcher's personal experience, web and media evidence, legislative hearing, court verdict, staff memorandum, unpublished project or study document, anecdotal evidence and story, citation of or discussion with experts, practitioners and stakeholders* (Talukdar 2013a).

> *Participant Observations* involve a range of well-defined, though variable techniques, *for instance, informal interviews, direct observation, participation in the life of a group, collective discussions, analysis of personal documents produced within the group, self-analysis, results from activities undertaken off or online, and life histories* (DeWalt et al. 1998).

## National and Local Governments Relationship

Local governments in all countries must relate to higher levels of government, either state or

N

| Union *Parishad*s (118) | Union *Parishad*s<br>(4553–118) = 4435 | Cantonment board<br>(one in each cantonment area) |
| *There is a legal debate whether Chittagong Hill Regional Council is to be considered as local government unit/institution. Furthermore, Upazila Parishads, Municipalities and Union Parishads at Hill areas functionally do not have link with the Ministry of Chittagong Hill Tracts Affairs, rather these have direct link with the Local Government Division under the Ministry of Local Government, Rural development and Cooperatives. Also, literarily, Cantonment Board is not considered as a local government institution.* | | |

Source: Adapted from Talukdar 2013

provincial level, or to the national government. Realities in many countries, the higher levels, by and large, dominate relations. For instance, central control, even to the determination of local authorities themselves, is marked in Sri Lanka. Also, Korean experience reveals that freely elected council does not necessarily have recognition of local government unless the entire local politicians do administer central commands.

Nevertheless, globally, even in Asia, there are signs of increasing strength at the local level and cooperation between the levels. In China, for example, local government is increasingly playing a part in local economic development, and some of its local governments are beginning to exercise influence on central government. In general, there is a co-dependency and complement in central and local government relations in Japan.

In the context of local government in Bangladesh, central-local relationship has always been an issue. Although local governments are apparently capable to solve the local problems, the government in many countries, as in Bangladesh, does have the extensive authority to fully control local governments. In Bangladesh, the key aspects and notions of this control are categorized by political, fiscal, and administrative dimensions.

## Political Motives in Reform Initiatives

Despite the fact that many reform initiatives have been taking place for development of local government in Bangladesh, most of such initiatives that hold narrow political motives have resulted in a fragile local government system. Even during democratic regimes, many of the administrative and local government reform committees/commissions worked to produce reports manifesting the then government's desire.

## Fiscal Aspect

Local government institutions cannot impose new tax or increase the rate of imposed taxes or even finalize the budget without approval of the national government. Besides, the government exercises extensive control on functions and spending of local institutions through the financial aid to these institutions (Ahmad 1994: 452). The annual budgets of the local government (LG) units are scrutinized and approved by different levels of government agencies. Again, LG authority is undermined by the government bureaucracy in many ways, for instance, government officials exercise superior authority in appointment of local government staff and by allocating staff

payment sanction in the intergovernmental transfers (Talukdar 2013).

### Administrative Aspect

The government may transfer any institution or service maintained by the local government to the government management and control and reciprocally may alter any institution or service maintained by the government to the local government management and control. Local government institutions do not have authority to undertake any new work without the administrative approval of the pertinent government authority, and this is adversely affecting to the local government innovations and novel initiatives (GOB 2009; Talukdar 2013).

## Local Governance Process

Local governance refers governing at the local level that is viewed broadly to include not only the machinery of the government but also the community at large and its interaction with locally elected authorities, while democratic local governance is, in turn, carried out the local governance in a participatory, responsive, accountable and increasingly effective, as well as democratic fashion. In such a framework, decentralization enables the local governance system with the opportunity to become increasingly democratic in nature (USAID 2000). Many countries around the world – for several reasons and with varying degrees of intention and success – have been attempting to create or strengthen the sub-national or local governments in recent years (Smoke 2003). Box 1 shows some examples of evolving notions with the success and failure stories of local governance in indifferent countries including Bangladesh.

**Box 1 Evolving Notions with the Success and Failure Stories of Local Governance**

In Eastern Europe and the former Soviet Union, rising the local governance was part of the political and economic transformation following the fall of Berlin wall; in Latin America, it was to reinforce the transition to democracy; in South Africa, Sri Lanka, and Indonesia, it was a response to ethnic or regional conflict; and in Chile, Uganda, and Côte d'Ivoire, it was to improve the delivery of basic services (Shah and Thompson 2004), while in Bangladesh, the widespread emphasis is evident on democracy as the current round of decentralization as part of the sustainable development and good governance track of the country.

Even though there are problems associated with the central delivery of services, the experience with decentralization has been quite mixed and diverse in most countries (World Bank 2003; Burki et al. 1999). There are failure evidences, but also success stories. Evidence from Eckardt (2008) supports that regardless of extensive strides of devolution of authority and resources to democratically elected local governments, decentralization in Brazil, Colombia, and West Bengal has attained little in improving service delivery.

However, Faguet (2001) shows that decentralization in Bolivia has led to a well match between local predilections and budgetary allocations. Also, Grindle (2007) notes down that local officials are praised for the innovations they introduced in the governance of their communities and the new spaces they shaped for civic participation. In some cases, governments have become global models for such innovations; Porto Alegre in Brazil, for example, has become famous by introducing the participatory budgeting process. In Mexico, cities such as Aguascalientes, Leon, and Monterrey have become well-known for efficient and responsive governance model. At municipalities in India, Kenya, the Philippines, South Africa, and elsewhere, citizens

(continued)

**Box 1 Evolving Notions with the Success and Failure Stories of Local Governance** (continued)

have shared information, made decisions about resource allocation, monitored policy implementation, and envisioned developments that would change the future of their communities.

Talukdar (2013) identifies that Sirajganj in Bangladesh is also noted for the local governance development that has resulted from the Sirajganj Local Governance Development Fund Project (SLGDFP). Sirajganj Local Governance Development Fund Project, supported by UNDP and UNCDF, had been running successfully from 2000 to 2007 in the 82 Union Parishads of Sirajganj district.

Furthermore, participant observations of the researcher as being formerly staff member of UNDP-Bangladesh under its local governance portfolio during 2008–2010 and as being formerly program board member of local governance program *Sharique* during mid-2013–2016 support to portray another experiment and one innovation in Bangladesh. First, the Government of Bangladesh replicated and tested the experience of SLGDFP in additional five districts (Barguna, Satkhira, Feni, Narsingdi, and Habiganj) and again in Sirajganj through Local Governance Support Project-Learning and Innovation (LGSP-LIC) with the grant support from UNDP and UNCDF, Danida, and the European Union. Second, local governance program *Sharique-III*, in cooperation with National Institute of Local Government (NILG) in Bangladesh, introduced an innovation titled "Union Parishad Local Academy (UPLA)" at three Unions in Rajshahi and Chapai Nawabganj districts of the country during 2013–2016. Sharique-III was mandated by SDC to a consortium comprised of HELVETAS Swiss Intercooperation and BRAC Institute of Governance and Development-BRAC University in Bangladesh for almost three and half years – September 2013 to December 2016.

## Balance of Power

The term *balance of power* refers to the power being held by a subsystem comparing with the system remains strategically balanced. It also signifies the case of somehow in agreement of the competing and cooperating forces with the status quo strengths. Literally status quo denotes the condition or situation that presently exists. In this connection, levels of satisfaction between subsystems and system matter because a discontented subsystem craves the status quo to change, while on the other, the dominant force supports to sustain the status quo.

In a relationship between the government and sub-national governments, *balance of power* means distribution of power and authority between a central or national government and its sub-national or local governments. In federation, *balance power* typically entails the magnitude of power is being centralized in the central federal government or devoted to its regional and provincial governments. The Commonwealth of Australia, for example, is a federation in which the power has distributed between the levels of government favoring the central federal government. In decentralized federation, known as *confederation*, the reverse must be true, i.e., power is to be allocated favoring the sub-national levels of the government (regions, states, or provinces). Canada, for instance, is a model of such *confederation*.

Following this global comparative analysis based on a priori *knowledge*, the focus is being shifted now into Bangladesh with the empirical analysis. The discussion and analysis of *balance power* between the government and local governments in Bangladesh, under the current round study, portray the evidence-based responses to

the research questions sketched at the introduction of the paper.

### Does the Balance of Power Matter?

*Whether or to what extent the balance of power matters for the local governance and its pro-people service delivery in Bangladesh?* Apparently *balance of power* matters for the local governance. It matters because improving as well as enlightening the lives of local people and communities matters.

The most frequently cited problem associated with decentralization is the shortage of capacity at sub-national levels of government in discharging the public services they are assigned (World Bank 2005). Observations reveal that the balance of power between the government and local governments ensures the authority, responsibility, accountability, and capacity for the delivery of public services entrusted to the local entity.

Furthermore, lack of resources and finance remain daunting issues for effective functioning of the local government in Bangladesh. These are not the only barriers for the success of decentralization in Bangladesh; the most critical part in the context of Bangladesh and elsewhere is the changing behavior and institutionalizing decentralization with the democratic values (Talukdar 2013), where balance of power between the levels of government – local and national – does matter.

Fundamentally, balance of power matters because the force of the governance of a state depends upon a strong democracy and a strong democracy necessitates two important elements: the first one is the popular participation at the local level and the second one is the popular participation at the national level. The two are interconnected and intertwined. If popular participation at the grass roots continues to decline, the national politics in a country will not be immune from the consequences. Flourishing democracy at the grass roots is only likely when local people understand the fact what and how local government is responsible for its policy and resources, and where they (local people) can hold the local government accountable for its performance, and whether the local people crucially believe that local government can make a real difference (Talukdar 2013, 2014).

Furthermore, observations suggest the need for government to set and monitor national strategic goals keeping the local government autonomy is pivotal. Local authorities should have the freedom to shape the development framework of their communities and the scope to unlock the full potential of local innovations and to invest for their capacity development. Davey (2003) points out that extent of local discretion would be a matter of balance between national and local interests. Neither the national government control nor the local government autonomy should have unchallenged precedence.

### Constitutional Spirit

*Whether the constitutional spirit in relation to central-local balance of power helps boost up the local governance in Bangladesh*? Although Articles 11 and 59(1) of the Constitution of the People's Republic of Bangladesh promote and prescribe to have democratic local governments, the Article 59(2) and the Article 60 of the Constitution empower the legislature to determine the frame, nature of power, and level of autonomy of local governments. Talukdar (2013) observes that Article 9 which was previously a powerful constitutional instrument for the development of local government institutions in Bangladesh replaced with "Nationalism" by the *Fifteenth Amendment* of the Constitution of Bangladesh in 2011.

Theoretically, democratic local government falls under the democratic decentralization that goes further than the devolution does in terms of autonomy, responsibility, and accountability of the local authority and concerning participation, opportunity, and emancipation of the people. Two interlinked and inevitable components of this latest form of decentralization are structural decentralization and institutional democratization (Talukdar 2013, 2014).

> Structural decentralization refers to devolution in the organization and relationship of government units, in relation to one another including a shift of production and provision functions to more localized government units. (Hicks and Kaminski 1995; Rainey 1997)

Basically, structural decentralization alerts the balance of exercising the power among levels of government favoring localized levels of government; even to some extent this component allows local people's representatives to govern the local government, but values associated with legacy do not always change until it goes with institutional democratization (Talukdar 2013, 2014).

> Institutional democratization refers to this shift in values, rules, skills, and interactions, favoring transparency, equity, responsiveness, accountability, and other traditional democratic values. (Hodgson 2006; McGill 1997; OECD 1996)

Evidence of "institutional democratization" can be found through functioning monitoring and accountability mechanisms and by ensuring the efficient integration of citizenry input into public decision-making process (Coston 1998; Klingner 1996).

A fully fledged democratic decentralization not only creates environment for wider participation and social inclusiveness, as well as for citizens to demand accountability of local authority, but also generates a sense of transparency and accountability of the political system and governance (Talukdar 2013, 2014).

The contemporary decentralization literature recognizes the importance of the central state in bringing this democratic decentralization and thus demands from the central or national government a classy coordination, monitoring, and accountably mechanism to be placed, as well as its willingness to allow autonomy (especially fiscal autonomy), democratic participation, and practice at the local level (Crook 2003; Olow 2003; Dauda 2006). In turn, the local government institutions (LGIs) must show a certain merit of self-government by providing a transparent, accountable, and innovative administration along with a participatory political process that helps in alleviating marginalization and poverty (Dauda 2006).

Furthermore, power of the local government, central-local relationship, degree of democratic and fiscal decentralization, and functions as well as functionaries of the local government are depending on the mode of legislature (as is evident in the Article 60 of the Constitution). Talukdar (2013) reveals that the inclination of the legislation does not seem very conducive for an effectual functioning of the local government in Bangladesh.

Thus, considering the critical concern with regard to constitutional guarantee in ensuring central-local balance of power, some studies, for instance, Ahmed (2012) and Talukdar (2013), support Indian model of constitutional guarantee. The 73rd and 74th Amendments of the Indian Constitution generated a clear sense on the issue. Talukdar (2013, 2014), however, argues with the evidence that constitutional assurance is not the ultimate to build up a high-quality sub-national government as well as good local governance. For example, the success of the local government in Britain, without such constitutional safeguarding, reminds us the fact that democratic practice is central to the democracy and democratic decentralization. But Bangladesh is not in a position of Britain, particularly in terms of democratic practices. While in Uganda and South Africa, political authorities passed statutory and constitutional guarantees for local government development just 23 years back, (In Uganda democratic local councils (previously called resistance councils) were adopted by the 1996 Constitution followed by a further development of the local government by the Local Government Act of 1997. Also, in South Africa the 1996 Constitution provided mandate basically for a democratically decentralized local government [see chapter 7, section 152(1)/e and section 153 (a), Constitution of South Africa, 1996].) now both countries are noted as examples for the democratic development of the local government as well as the robust local governance. The success of these counties has underpinned a lesson that the constitutional guarantee is as important as democratic commitment does for a strong local government system and for serving the deliberate governance at the local level, particularly for a country like Bangladesh.

## Practical Situation

*Considering the practical sense, how far Bangladesh is away from an equitable balance of power arrangement between national and local governments?* To understand the response of this question, it is important to realize the

**National and Local Governments Relationship in Bangladesh, Fig. 1** Intergovernmental relationships

relationship of the levels of government that is already discussed. Moreover, Fig. 1 demonstrates the intergovernmental relationship at a glance.

In fact, both the government and legislative body hold linear relationships with the local government units in Bangladesh (as is shown in Fig. 1 and Table 2). How do these linear relationships exist in this case? Any change in the government's attitude/position/policy/circular/rules related to local governance or government line departments (independent variable) affects the local government (dependent variable) much and straightforwardly. Same is true in the case of legislative body (independent variable) and the local government (dependent variable) relation: it could be relating to the local government law formation/amendment or parliamentary committee affairs on local governance or legal and practice issues dealt by legislators concerning local governance.

Any change with relevant aspects of these two independent variables always candidly generates a corresponding change in the stated dependent variable. The government's decision to hold *Zila Parishad* election, for example, made all local government units active and focused toward confirming that election schedule. Another example is that the provision of advisory role of legislator in the *Upazila Parishad (Reintroduction of the Repealed Act and Amendment) Act, 2009*, and subsequent practice of the advisor, inevitably invite a conflict management concern in the upazila governance.

Central-local relationship in the context of Bangladesh has historically been continuing under the framework of dependency theory, while the national government always plays a dominant role here. This might be the result of a long colonial legacy and the absence of democratic government at the national level for a considerable period (1975–1990) of the independent Bangladesh. Observations support, it is also resultant from the excessive influences of the legislators on the local government bodies both de jure and de facto ways.

Also the local government in Bangladesh is not just the creation of the government or of the act of legislature, but also it ought to go under the control of rules and regulations of the government (Ahmad 1994: 450). In practice, the local government institutions get controlled through several conflicting orders and circulars from different agencies or ministries, which most often contradict the original Local Government Acts. Thus, the local government bodies cannot freely exercise their powers, even those bestowed upon them by the national government, within the limits defined by the legislature. This means the local governments are not exclusively empowered and the authority of the local government institutions is undermined by the other authority, even by an individual legislator.

Furthermore, local government bodies in Bangladesh have been persistently resource poor. The local government regulations have empowered them to mobilize resources from the local sources through assessment, levy of taxes, leasing of local Hat-Bazars, etc. But the local government institutions do not receive the total resources generated from the authorized sources (Khan 2000; CPD 2001).

In the case of *Union Parishads* (UPs), for example, out of the total revenue generated from the leasing of the rural market, 25% is retained by

the national government and 10% by the *Upazila Parishad*, and 15% is earmarked for the maintenance of the market, and the rest 50% is the entitlement of the UP. Another feature of the government's financial control on UPs is that the Upazila Nirbahi Officer (UNO) (The UNO, an officer of the central government posted in upazila, serves secretarial services to the elected Upazila Parishad and acts as the principal executive and coordination officer of the upazila.) receives some sorts of funds transferred from UP-mobilized resources, such as share of land transfer tax/fee and market lease money, for retention in the accounts maintained by him/her for lateral distribution to UPs based on the prescribed government guidelines (Khan 2000; CPD 2001).

Local government institutions in Bangladesh are entitled to get the Annual Development Plan (ADP) block grants from the national government. The local government regulations prescribe that the block grant must be used specifically in certain sectors determined by the national government. This pre-determined sectoral allocation seriously limits the scope of local level planning, as well as the flexibility of local bodies to utilize such a financial resource in encountering the demanding needs of the community.

Material, financial, and human resources of local government institutions in Bangladesh are not commensurate with their tasks and responsibilities. They are not self-regulating in determining their internal administrative structures and thus appointing their staff members, even with their own resources. Furthermore, local government institutions (LGIs) do not have, within the regulations, access to national and international capital markets, i.e., there is no sub-national borrowing authority of LGIs, but they have certain level authority to adapt innovations and tailor public-private partnership initiative for limited capital investment (Talukdar 2014).

In principle, supervision, suspension, or dissolution of local government-elected representatives or local councils would be exercised by the pertinent authority of the government in accordance with procedures in acts/laws. But there is no independent local government commission in this regard. The scholars, practitioners, and local elected representatives are lauding the need for an enduring local government commission for years.

### Other Important Relationships

*To what extent the relationship of national and local governments affects other important relationships, for instance, relationship of legislators and elected representatives of local governments and relationship of local bureaucrats and elected representatives of local governments?* The concern relating to inequitable distribution of authority, resources and power between the national government as well as the legislative body and the local governments helps understand the relationship of the government and local governments, as well as the relationship of other influential players in this regard: first, the relationship of concerned legislator and elected representatives of the local governments; and second, the relationship of local bureaucrats and elected representatives of the local governments.

There are understanding gaps between the elected local government bodies and the concerned legislators. There is also a shadow stress between the local bureaucracy and elected representatives. The elements of strained situations exist in the legal aspects (Talukdar 2013). Figure 2 portrays the key players or actors involved in local governance in Bangladesh.

The figure above shows that the closer to the local community is the local government (LG) representatives, officials of the local government institutions and their line departments/agencies, and the local stakeholders, who jointly facilitate local governance by involving in different standing/steering and project committees. Observations reveal that the standing/steering committees of the local government are not active and so in-depth involvement of this enlightened group of the community in the local governance process is missing considerably.

Furthermore, observations and preceding analysis support that the national government typically exercises its dominant influence over the local governments through the intergovernmental transfer and by the complicated orders and

**National and Local Governments Relationship in Bangladesh, Fig. 2** Key players of local governance

circulars from different agencies or ministries. Specifically, concerned ministries of the government hold excessive control over the local governments by rules, regulations, and official letters and/or through their local agents (i.e., officials of the line departments and other local bureaucrats).

A recent study of Talukdar (2018), however, reveals that rationality of the government conditions on intergovernmental transfers and control on local governments is tied to the crisis of self-responsibility and competence of local government representatives. Government conditions are further rooted in the unavoidable intergovernmental resource dependency and call for ensuring financial accountability, as well as monitoring the performance of local governments. Finally, observations also support that the concerned legislative members, given the feeble loop of the relationship between the national and local governments, do immense and overriding influence over the local governance issues.

## Conclusion

The importance of a good local governance is universally acknowledged, and it must require placing a robust local government system. Yet the strengthening local government institutions evolves differently in different countries given the different context and purposes. Even in many places around the globe, it is evident just at academic works, conference discussions, political debates, election manifestos, and/or reform objectives. Development partners and scholars, however, are increasingly in agreement for strengthening mechanisms of local governance in ensuring the governance and development for the people and by the people.

Bangladesh has recently undertaken several legal reforms for strengthening the local governance, but the country has yet to enact the balance of power between the local government institutions and the national government. The latter persists instability of the local government system and distresses quality service delivery needed for the local people. The absence of the balance of power between the government and local governments in Bangladesh helps the national government of the country exercise immense control on local government institutions, but it wanes the institutional value, spirit, and norms of the local government.

# National Labor Relations Act

Steven E. Abraham
State University of New York at Oswego, Oswego, NY, USA

## Synonyms

LMRA; NLRA; Wagner Act

## Definition

The Law governing private sector labor (union-management) relations in most industries.

## Introduction

The National Labor Relations Act (NLRA or the Act) is the law that governs union management

relations in the majority of private sector industries in the Unites States. The heart of the Act is Section 7, which grants employees rights that fall into three categories: (1) the right to form, join, and assist labor unions, (2) the right to bargain collectively through representatives of their own choosing, and (3) the right to engage in concerted activities for the purposes of collective bargaining or other mutual aid and protection. Section 7 also grants employees the right to refrain from any of those. The Act is administered by the National Labor Relations Board (NLRB).

This entry will discuss labor or the Board law in the United States prior to the passage of the NLRA and the passage of the NLRA itself. This will be followed by a discussion of the Act's coverage, how the employees of a firm choose to be represented by a labor organization, collective bargaining under the Act and the meaning of concerted activities.

## Labor Law Prior to the NLRA

Labor relations in the United States was governed by a variety of legal doctrines prior to the NLRA. In the early 1800s, many courts held that concerted activities by workers (e.g., strikes) were common law criminal conspiracies. In a well-known case from that era, *Commonwealth v. Pullis*, 3 Doc. Hist. 59 (Philadelphia Mayor's Court, 1806), workers were convicted of criminal conspiracy for refusing to work except at a specified wage rate and for attempting to prevent others from working for a lower wage.

*Commonwealth v. Hunt*, 45 Mass. 111 (Mass., 1842) marked a shift from criminal to civil liability as the tool for adjudicating union activity. Employees had refused to work for employers who paid their employees less than union scale. The court dismissed the criminal indictment and adopted an ends/means test instead: The finding of a criminal conspiracy required proof of either an illegal purpose or the use of illegal means.

In the early 1900s, the courts began to apply the Sherman Antitrust Act to limit unions' activities. In the Danbury Hatters case (*Loewe v. Lawlor*, U.S., 208 U.S. 274 (1908)), the Supreme Court held for the first time that the "restraints of trade" provisions in the Sherman Antitrust Act could be applied to activities by labor unions. As a result of this decision, unions were subject to both treble damages and injunctions a number of times in the early 1900s. Congress attempted to diminish unions' exposure to antitrust liability in the Clayton Act that that was passed in 1914, but in *Duplex Printing Press Co. v. Deering*, 254 U.S. 443 (1921), the Supreme Court read the Clayton Act provisions protecting labor activity narrowly; this meant that unions continued to be held liable under the Sherman Antitrust Act.

The first federal law to benefit unions was the Norris-LaGuardia Act (1932). Norris-LaGuardia specifically removed federal courts' power to issue injunctions in labor disputes. While this has been modified slightly since 1932, for the most part, unions remain insulated from federal court injunctions to his day. In addition, Norris-LaGuardia prohibited employers from requiring employees or prospective employees to sign "yellow dog contracts" – contracts in which the person agrees not to join a union as a condition of employment.

Another important precursor of the NLRA was Section 7a of the National Industrial Recovery Act ("NIRA") (1933). That section specifically granted employees a number of rights related to unions and collective bargaining. Interestingly, the NIRA would have not been overly effective, however, as there were no penalties on employers who violated its provisions and because there was no agency created to enforce them. Nevertheless, while the NIRA was declared unconstitutional by the Supreme Court in *Schechter Poultry Corp. v. United States*, 295 U.S. 495 (1935), that section would reappear in similar form in the NLRA 2 years later.

The last piece of legislative activity leading up to the NLRA was Labor Disputes Act, introduced into the Senate by Robert Wagner in 1934. The LDA included sections enumerating employee rights related to unions and also specified certain employer unfair employer practices. While the LDA ultimately was withdrawn, much of what was contained in the LDA would reappear in the

Wagner Act, the bill that would become NLRA, the following year.

## Components of the NLRA

The NLRA essentially consists of three separate laws, passed at three different times.

### The Wagner Act

The Wagner Act is the first piece of legislation comprising the NLRA. The National Industrial Recovery Act, mentioned above, has been fairly ineffective in protecting employees from employer retaliation for unionizing and in any event, it has been declared unconstitutional. Both laws were a part of Franklin Delano Roosevelt's New Deal program. The New Deal was Roosevelt's economic recovery plan designed to help the economy recover from the Great Depression. FDR argued that the NLRA would help stabilize the economy by raising wages and giving workers more capacity to buy things, and thus help many Americans who were out of work. The key provision of the Wagner Act, which was similar to the NIRA and the LDA, is Section 7. As enacted in 1935, Section 7 stated:

> Employees shall have the right to self-organization, to form, join or assist labor organizations, to bargain collectively throughout representatives of their own choosing, and to engage in concerted activities for the purpose of collective bargaining or other mutual aid or protection.

Section 7 was enforced by Section 8, which enumerated five employer unfair labor practices (actions by an employer that would violate the Act), Section 9 of the Wagner Act set forth the procedures for determining whether employees of a company would be represented by a union, and Section 3 of the Act established the National Labor Relations Board, the administrative agency which administers, interprets, and enforces the NLRA. The Wagner Act contained no restrictions on the activities of unions.

### Taft-Hartley Act

Many business and corporate interests continued to oppose the Wagner Act and the expanded rights it gave American workers and unions throughout the 1930s and 1940s. Republicans gained a majority in both houses of Congress in 1946, and in concert with conservative Democrats, introduced a number of bills from 1945–1947 to increase business's ability to resist unionization. Their success was due to a variety of factors - ranging from the Dies Committee investigations into Communists in the labor movement to the public's reaction to a strike wave in 1946, which was occasioned by worker attempts to restore real wages to previous levels after the inflation that occurred during WWII. Ultimately, Congress amended the NLRA in 1947 by enacting the Taft-Hartley Act (also known as the Labor Management Relations Act). The Taft-Hartley Act was enacted only after Congress overrode President Truman's veto. The first major thing done by Taft-Hartley was to add the words "and shall also have the right to refrain from any or all of such activities. . ." to the end of Section 7. Adding these words did more than signal a shift in congressional policy from being totally in support of unions towards neutrality. They paved the way for Congress to restrict unions' activities as well. By stating that employees had the right to refrain from joining unions, engaging in concerted activity, etc., it became possible for Congress to make it illegal for unions to interfere with employees' rights to refrain from the exercise of those rights. The Taft-Hartley Act also added Section 8(b), containing certain unfair labor practices by unions, to the NLRA. Probably the most important of these is Section 8(b)(4)(B), which prohibits unions from engaging in "secondary boycotts" (see below). Finally, the Taft-Hartley Act allowed states to pass right-to-work laws; laws that prohibit unions and employers laws from inserting clauses requiring union membership as a condition of employment into their collective bargaining agreements. Such clauses are permitted in the absence of a state right-to-work law.

### Landrum-Griffin Act

The final piece of NLRA is the Landrum-Griffin Act (also known as the Labor-Management Reporting and Disclosure Act) passed in 1959. Commencing in 1957, Congress held hearings

known as the McClellan hearings, which focused on improper/corrupt practices committed by certain labor unions, most notably the Teamsters. As a result of these hearings, business leaders convinced many in both Houses that legislation was needed to curb unions' abuses. Ultimately, these hearings led to the Landrum Griffin Act. These amendments contain a bill of rights for union members, require certain financial disclosures by unions, prescribe procedures for the election of union officers, and provide civil and criminal remedies for financial abuses by union officers. The Landrum Griffin Act made some minor changes to the existing provisions in the NLRA as well.

There have been no major changes to the NLRA since the Landrum-Griffin Act was enacted in 1959 although the Act was amended in 1974 to extend coverage and protection to employees of nonprofit hospitals. Nonprofit hospital workers were covered by the original Wagner Act in 1935 but were excluded in 1947 with the Taft-Hartley amendments.

## The Act Itself

### Coverage

The NLRA basically applies to virtually all private sector organizations in the United States. The federal government and its employees, with the exception of postal service employees, are covered by Title VII of the Civil Service Reform Act, while railways and airlines are governed by the Railway Labor Act. States and their political subdivisions are covered by laws in each state. While the NLRA could apply to all private sector organizations not covered by the Railway Labor Act, the NLRB has placed jurisdictional limits on its coverage (https://www.nlrb.gov/rights-we-protect/jurisdictional-standards). These standards mean that the NLRA does not cover businesses below a certain size in terms of revenue. Businesses not meeting the NLRB's jurisdictional standards are covered by laws in each state.

One interesting issue related to the coverage of the NLRA deals with whom the Act protects. By its terms, the rights in the Act apply to "employee[s]," as defined in Section 2(3). As part of the Taft-Hartley amendments of 1947, however, the definition of employee was amended to exclude "supervisors" as defined in Section 2(11) of the NLRA. Over the years, there has been a great deal of controversy over which category of workers fall within the definition of "supervisor." Clearly, as the interpretation of "supervisor" expands, the number of people protected by the rights provided by the NLRA decreases.

### What the NLRA Does

As stated above, the key provision of the NLRA is Section 7, which essentially provides three categories of rights to employees: (1) the right to form and join unions, (2) the right to bargain collectively through representatives of their own choosing, (3) and right to engage in concerted activities for the purposes of collective bargaining or other mutual aid and protection. Each of these will be discussed below

#### Employees' Right to Join Unions

As noted above, Section 7 of the NLRA specifically grants employees the right to join a labor organization. This right is safeguarded by the unfair labor practices enumerated in Section 8(a) of the Act. In particular, Section 8(a)(1) makes it an unfair labor practice for an employer "to interfere with, restrain, or coerce employees in the exercise of the rights guaranteed in Section 7" and Section 8(a)(3) makes it illegal for an employer to discriminate against an employee "to encourage or discourage membership in any labor organization."

Section 9 of the NLRA basically delineates the procedure for determining whether a group of employees working for an employer will be represented by a labor organization. When a substantial number of employees present evidence to the NLRB that they wish to be represented by a given labor organization, the Board's election process begins. After certifying that a sufficient number of employees have shown interest in being represented by a union (30% is the threshold), the Board will conduct a hearing to establish the terms of the election. Perhaps the most important issue that the Board needs to determine is the

"bargaining unit." The bargaining unit basically refers to the employees that will be grouped together for the purposes of determining whether or not they will be represented by a given labor organization. In other words, it is not necessarily the case that all of the employees of a given organization will be represented by a particular union, even if the union wins the representation election. Rather, the NLRB formulates a "bargaining unit" consisting of employees within the company that share a "community of interest" (similar terms and conditions of employment, similar supervision, etc.). The employees within the bargaining unit vote on whether they wish to be represented by the union. If the union receives a majority of the votes cast, that union will represent all of the employees in the bargaining unit. If the union receives less than a majority, none of the employees is represented by the union. This is known as the NLRA's exclusivity principle, as defined by Section 9(a) of the Act. Once the results of the election are certified, the "contract bar rule" prevents any organizing activity within that same bargaining unit for an entire year. If the union wins the election, it is guaranteed to represent the employees in the bargaining unit for a full year. If the union loses the election, there can be no organizing activity among the employees in the bargaining unit for another year.

Once the NLRB sets the date for the representation election, the preelection campaign takes place, as the union and employees who support that union try to convince the employees in the bargaining unit to vote for the union and the employer tries to convince the employees to vote against the union. Several sections of the Act are relevant to the election campaign. As mentioned earlier, Section 8(a)(1) makes it an unfair labor practice for an employer to interfere with the employees' Section 7 rights and among these rights is the employees' right to join a union (Concomitantly, Section 8(b)(1) makes it an unfair labor practice for unions to interfere with employees' Section 7 rights, which, as stated earlier, include the right to refrain from joining a labor organization.). Section 8(a)(1) is reinforced by Section 8(a)(3), which makes it illegal for an employer to discriminate against employees to discourage or encourage membership in a labor organization. Together, these sections limit the actions that an employer can take in an attempt to persuade the employees to vote against a labor union in a representation election. On the other hand, when the Act was amended in 1947, Section 8(c) was inserted stating "[t]he expressing of any views, argument, or opinion, or the dissemination thereof, whether in written, printed, graphic, or visual form shall not constitute or be evidence of an unfair labor practice under any of the provisions of this Act [subchapter], if such expression contains no threat of reprisal or force or promise of benefit." Judicial decisions interpreting the Act make it clear that Section 8(c) allows an employer to attempt to convince the employees to vote against the union, as long as the employer's campaign does not include threatening the employees if they vote for the union and/or attempting to bribe them to vote against the union.

Another section of the NLRA that is relevant to the NLRB election process is Section 8(a)(2). That section makes it an unfair labor practice for an employer "to dominate or interfere with the formation or administration of any labor organization or contribute financial or other support to it." This section has two implications. For one, if more than one labor organization wishes to represent a company's employees, Section 8(a)(2) prohibits an employer from favoring one union over the other. The more important implication of this section is that it prohibits an employer from forming "company dominated unions." In a practice that was quite common at the time the Wagner Act was originally passed, companies, in an attempt to dissuade their employees from voting for truly independent unions, would form "company dominated unions" – sham unions that were basically controlled by the employer – and try to induce their employees to vote for the company dominated union instead of an independent union. Section 8(a)(2) was inserted into the Act to prohibit this practice. In the late 1990s, however, employers contended that Section 8(a)(2) interfered with their ability to utilize various forms of EI (employee involvement) programs. These

employer groups contended that NLRB interpretations of the Act had become so broad that virtually any type of EI program would be considered a "labor organization" and therefore, employer involvement in that EI program would lead to a violation of Section 8(a)(2). In fact, the Republican-controlled Congress passed a law called the "TEAM Act" (Teamwork for Employees and Managers Act). The Team Act would have inserted a proviso into Section 8(a)(2) stating, "Provided further, That it shall not constitute or be evidence of an unfair labor practice under this paragraph for an employer to establish, assist, maintain, or participate in any organization or entity of any kind, in which employees participate, to discuss matters of mutual interest, including issues of quality, productivity and efficiency, and which does not have, claim, or seek authority to negotiate or enter into collective bargaining agreements with the employer or to amend existing collective bargaining agreements between the employer and any labor organization." The Team Act was supported by virtually all organizations representing firms (e.g., the Chamber of Commerce) and opposed by virtually all unions. Ultimately, however, while the Team Act was passed by Congress in 1996, it was vetoed by President Clinton. And in fact, despite the failure of the Team Act, there are many EI programs in place today, in both union and nonunion firms.

Finally, Section 9(e) of the Act authorizes a unit of employees who are currently represented by a union to decertify that union. Essentially, the decertification procedure works in reverse of the certification procedure discussed above. If at least 30% of the employees no longer wish to be represented by the labor union that had been certified to represent them, they can file a decertification petition with the NLRB. And if over 50% of the employees vote against the union, it will be decertified. The same contract bar rule discussed above applies to decertification elections as well. The board will not entertain a decertification petition within the first 12 months after a union has been certified or while a collective bargaining agreement is in effect. But a collective bargaining agreement will operate to bar a decertification petition for only 3 years, even if the contract is for a longer-term.

### The Right to Bargain Collectively

The second right established by the NLRA is the right of employees to "bargain collectively through representatives of their own choosing." This right is further clarified by Section 8(a)(5) of the Act, which makes it an unfair labor practice for an employer "to refuse to bargain collectively with the representatives of his employees, subject to the provisions of section 9(a)." In other words, if a bargaining unit of employees has elected a union to represent them under the procedures established in Section 9 of the Act, Section 8(a)(5) makes it an unfair labor practice for an employer to refuse to bargain with the union. Concomitantly, Section 8(b)(3) of the Act makes it an unfair labor practice for a labor organization "to refuse to bargain collectively with an employer, provided it is the representative of his employees subject to the provisions of Section 9(a)." Collective bargaining is further defined by Section 8(d) of the Act, which requires the parties "to meet at reasonable times and confer in good faith with respect to wages, hours, and other terms or conditions of employment." Section 8(d) also specifies the procedure either party must follow if it wishes to terminate or modify a collective bargaining agreement that is in effect.

Judicial interpretations of the NLRA have held that collective bargaining subjects fall into three categories: mandatory, permissive, and illegal. Illegal subjects are those which may not be included in a collective bargaining agreement even if both parties wish to do so (for example, a union shop clause in a state with a right to work law would be an illegal bargaining subject because right to work laws outlaw union shop clauses). The majority of subjects are considered mandatory subjects of bargaining (e.g., wages, hours, work rules, benefits, discipline, etc.). If a subject of bargaining is considered mandatory, either party has the right to resort to economic weapons if a bargaining impasse is reached. For example, if the parties cannot come to an agreement on wages and they bargain to impasse, the

employees have the right to go on strike and the employer has the right to lock out the employees. With permissive bargaining subjects, however, the parties may not resort to economic weapons if an agreement is not reached. A second important consequence of the mandatory/permissive distinction is that the employer must bargain with the union prior to implementing and/or changing a condition of employment when the change involves a mandatory subject of bargaining, but the employer need not bargain with the union prior to implementing a change concerning a permissive subject. For example, drug testing of employees has been determined to be a mandatory subject of bargaining, and this means that the employer may not unilaterally institute a drug test without bargaining to impasse with the union first. On the other hand, in a controversial series of cases, the Supreme Court has determined that most plant relocation decisions are permissive subjects of bargaining. This allows an employer to relocate a plant without bargaining with the union over the decision to do so. It should be noted, however, that even if a subject is considered to be a permissive subject of bargaining, the employer is required to bargain with the union over the effects of that decision. In other words, while an employer may relocate a plant without bargaining with the union over the decision to do so, the employer must bargain with the union over the effects of that decision.

One final point regarding collective bargaining and the duty to bargain is that it is specifically stated in Section 8(d) of the Act that "but such obligation does not compel either party to agree to a proposal or require the making of a concession." Therefore, it generally is not considered bad faith bargaining to adopt a "take it or leave it" stance with respect to a particular bargaining subject or set of subjects. While adopting such a stance with respect to many bargaining subjects might be considered evidence of bad faith bargaining, especially if this approach is coupled with other indicia of bad faith bargaining, decisions interpreting the Act make it clear that a take it or leave it stance is not, in and of itself, lack of good faith bargaining.

### Concerted Activities

The third right established by the NLRA is the right of employees to "engage in other concerted activities for the purpose of collective bargaining or other mutual aid or protection." It is important to note that employees' right to engage in concerted activity is not dependent on whether the employees are represented by a labor organization. In other words, if two or more employees act together for the purposes of "collective bargaining or other mutual aid or protection," the activity would be protected by Section 7 of the NLRA, even if those employees are not represented by a labor organization that has been chosen pursuant to the procedures described in Section 9. For example, if two employees went to management to complain about their wages or something else related to their working conditions and were disciplined for doing so, that discipline would violate Section 8(a)(1) of the Act, because the two employees would have been engaged in concerted activity protected by Section 7 of the Act.

In many ways, one might say that the epitome of "concerted activity" protected by the NLRA is the strike. While Section 7 does not specifically use the word "strike," Section 13 of the Act states "[n]othing in this Act, except as specifically provided for herein, shall be construed so as either to interfere with or impede or diminish in any way the right to strike." Interpretations of the NLRA place strikes into two categories. Economic strikes are those called in an effort to put pressure on the employer during the collective bargaining process, whereas unfair labor strikes are strikes called to protest an unfair labor practice committed by an employer. The difference between the two strikes is that the employer may hire permanent strike replacements to replace economic strikers while only temporary replacements may be hired to replace employees who are on an unfair labor practice strike. Clearly, calling an economic strike is very risky from the employees' perspective. If they participate in an economic strike in order to put pressure on the employer in the collective bargaining process, they risk being permanently replaced. Likely, this explains why strike activity has decreased so significantly over time.

The economic weapon that employers can use in the collective bargaining process which is analogous to the economic strike is the lockout. In a lockout, the employer tells the employees represented by the union that they are not to come to work and operates the organization without the employees. And interpretations of the NLRA allow employers to hire temporary replacements to replace the employees who have been locked out. The employer may not use permanent strike replacements in a lockout, however.

Two other forms of economic pressure that are addressed by the NLRA are the boycott and picketing. The Act places certain limits on both. Section 8(b)(4)(B) prohibits unions from utilizing what is known as a secondary boycott. In a secondary boycott, a union will place economic pressure on a neutral employer with whom the union does not have a dispute in an effort to put indirect pressure on an employer with whom the union does have a dispute. For example, if a union is engaged in a labor dispute with a producer (for example, if the union and the producer cannot agree on a new collective bargaining agreement) and the union boycotted a retailer that uses the producer's goods in order to put pressure on the producer, that would be considered a secondary boycott. Secondary boycotts are outlawed by Section 8(b)(4)(B).

Section 8(b)(7) of the Act places limits on the ability of unions and employees to utilize "recognitional" picketing against an employer. Recognitional picketing is when a group of employees picket an employer, if the object/goal of the picketing is to force the employer to recognize a particular labor union as the representative of the employees. While recognitional picketing is permitted if no particular union has been lawfully chosen to represent the employees of an organization, it is prohibited if another union has been chosen to represent those employees or if there is been a representation election among those employees within the preceding 12 months and the contract bar rule would prohibit there being an election among those employees. If the employees are not currently represented and/or there could be a certification election among the employees, picketing may take place for up to 30 days. After 30 days, picketing must cease and/or a petition for a representation election must be filed with the NLRB.

As alluded to above, a great many activities undertaken by two or more employees would be considered "concerted activities" that are protected by Section 7 of the Act, apart from the traditional forms of concerted activity (strikes, boycotts, picketing) discussed above. And in recent years, a number of cases have involved precisely what types of employee actions are protected by Section 7. For example, in a fairly recent case, the NLRB determined that an employer committed an unfair labor practice by disciplining employees who made Facebook post about their supervisor and their working conditions, because the Facebook posts were considered "concerted activity" protected by Section 7. Therefore, the discipline violated section 8(a)(1) of the Act which makes it an unfair labor practice for employers to interfere with employees' Section 7 rights.

## Conclusion

As stated above, the NLRA consists of three pieces of legislation passed in 1935, 1947, and 1959. While several minor amendments dealing specifically with the healthcare industry were passed in 1974, the main parts of the Act have not been amended since 1959. Many union supporters complain that the NLRA is outdated and needs to be amended, because in its current form, the Act is responsible for a number of adverse consequences faced by unions in the United States. In fact, during the Obama administration, a number of bills, each of which was known as the "Employee Free Choice Act" (EFCA), were introduced into Congress. The EFCA would have amended the NLRA in three major ways. Section 2 would have eliminated the need for representation election to determine whether a unit of employees would be represented by a union if the union could demonstrate that a majority of employees had signed authorization cards expressing their desire to have the union represent

them. Section 3 would have required that following a union's initial certification, the union could require the employer to begin bargaining within 10 days; if an agreement could not be reached within 90 days, the situation would have been referred to mediation; if mediation failed, binding arbitration would have been required. Section 4 would have increased the penalties on employers who discriminate against employees during the union organizing process. While the bill passed the House in 2009, it was never able to pass the Senate. Several other attempts to introduce the EFCA were not successful either. As a result, the NLRA appears, for the most part, as it did in 1959, although many contend that the Act is outdated and responsible for unions' current plight.

## NATO's Transparency/Secrecy Policies

### Synonyms

Access to information; Classification of information; Declassification; Disclosure of documents; Openness; Security organizations

### Definition

NATO's policies concerning classification of information, declassification, disclosure, and public access to information

### Introduction

NATO is among the international organizations that understand the major importance of communication policy, transparency, and accountability (including the release of documents) for the success of its policies and operations.

The organization has approved and published a remarkable amount of documents outlining its policy on communication, release of documents, and classified information ("NATO Security Policy" (June 2002); "The Management of Non-Classified NATO Information" (July 2002); "NATO Strategic Communication Policy" (September 2009); "Policy on the Public Disclosure of NATO Information" (November 2008); "NATO Information Management Policy" (December 2008); Primary Directive on Information Management (2008); "Policy on Retention and Disposition of NATO Information" (February 2009); "NATO Records Policy" (June 2011); "Directive on the Management of Records Generated on Operational Deployment" (February 2012); "Streamlining the Public Disclosure Programme: Request to Submit Items of Ongoing National Sensitivities" (April 2013); "Streamlining the Public Disclosure Programme: Refinement of the Process for Nuclear and Intelligence Related Information" (June 2013); "Guidelines for Inclusion of Non-NATO Nations in the Public Disclosure Process" (March 2014); Directive on the Preservation of NATO Digital Information of Permanent Value (July 2014), etc.). The most recent document with regard to transparency is the "Directive on the Public Disclosure of NATO Information," approved on August 4, 2014. It summarizes the rules of NATO's public disclosure policy.

On the one hand, NATO "recognizes that transparency is key to creating a public climate of support and understanding for the Alliance's missions and accomplishments" (Directive on the Public Disclosure of NATO Information. (Archives Committee, NATO, August 2014), https://www.nato.int/nato_static_fl2014/assets/pdf/pdf_archives/AC_324-D_2014_0010.pdf. Accessed 1 May 2018). The release of documents and information is an element of the NATO's coherent communication policy.

On the other, the vast amount of documents related to public communication that NATO approves does not make the organization better disposed toward disclosure.

## NATO Discloses Documents That Are at Least 30 Years Old

According to the major principle of dissemination, NATO's information becomes public once it is no more classified or sensitive. Information is disclosed and made available to the general public when it "has permanent value and is at least 30 years old; has been declassified by competent authorities in accordance with the NATO Security Policy and has been examined by competent authorities in the member nations and approved for public disclosure" (Public Disclosure of NATO Information. (Note by the Secretary General, NATO, November 2008), http://www.nato.int/nato_static/assets/pdf/pdf_archives/20120327_C-M_2008_0116_INV-Public_Disclosure.pdf. Accessed 1 May 2018).

In short, current NATO information could be disclosed to the public in no less than 30 years given certain conditions are met. When the information is related to the nuclear planning process and intelligence, it will be processed after 50 years (Directive on the Public Disclosure of NATO Information. (Archives Committee, NATO, August 2014), http://www.nato.int/nato_static_fl2014/assets/pdf/pdf_archives/AC_324-D_2014_0010.pdf. Accessed 1 May 2018).

This contradicts with the principles of transparency and accountability which demand that the information becomes available at the appropriate time and with no excessive delay. Contrary to standard legislative practices, concerning classification of information, NATO has no time limit for withholding sensitive information, which means that documents can remain secret indefinitely.

According to "Transparency International" (Classified Information. A Review of Current Legislation across 15 Countries and the EU. (Corruption Risks Series. Defence and Security Programme, Transparency International, 2014, p. 81), http://ti-defence.org/wp-content/uploads/2016/03/140911-Classified-Information.pdf. Accessed 1 May 2018), the absence of expiry of classification of NATO information contradicts the rule of law. "…The usual 30 year rule of archives which provides archival access to 'ordinary documents' at the latest within 30 years of their origination is turned inside out. In this case 30 years is the earliest date to gain access, while there is no time limit to withhold the non-ordinary documents."

The files are disclosed by competent NATO bodies annually or ad hoc. According to the systematic process in case the information is marked "unclassified" at the time of its creation, it shall be disclosed automatically after the 30-year period expires. If it is marked "restricted" and has not been declassified when reaching the 30-year threshold, it shall be first declassified and then disclosed after a further year. The information marked "confidential," "secret," or "top secret" shall be proposed for declassification and public disclosure taking into account the "NATO Exemptions" (Directive on the Public Disclosure of NATO Information. (Archives Committee, NATO, 2014), http://www.nato.int/nato_static_fl2014/assets/pdf/pdf_archives/AC_324-D_2014 _0010.pdf. Accessed 1 May 2018). These are categories of information that shall be withheld from declassification and public disclosure (The list of the so-called "NATO Exemptions" consists of ten exemptions: NATO 1 (information, the public disclosure of which would be likely to endanger NATO internal cohesion, members, missions, infrastructure or personnel), NATO 2 (sensitive personal information about individuals who were born less than 100 years ago), NATO 3 (confidential commercial information), NATO 4 (details about methods or sources of intelligence), NATO 5 (details about methods of mass destruction), NATO 6 (details about current cryptographic systems), NATO 7 (details about current weapons systems), NATO 8 (details about current political or military plans, policies and operations), NATO 9 (details about current internal or external NATO political discussions and sensitivities), and NATO 10 (details about current physical and information security)).

## In General, Even "Unclassified" Documents Are Not Public

Member states have de facto veto power over disclosure in cases of "specific national concerns," whereby information must be withheld.

There is an option for a document to be released on an ad hoc basis upon request of "the competent authorities" or a proposal of the NATO Archivist. During the ad hoc procedure, the release of a document is possible even before the 30-year period expires and even if the information does not have permanent value. Partial release of NATO information has also been allowed.

Documents that are not classified are marked "unclassified," but they are still not publicly available and are used for official NATO purposes only. In general, they are not disseminated to the public (The management of Non-Classified NATO Information. (Note by the Secretary General, NATO, July 2002), https://www.ncia.nato.int/Documents/Legal%20Office/C-M%282002%2960.pdf. Accessed 1 May 2018). Disclosure to the public is possible only with the approval of competent NATO authorities.

The information that is declassified and publicly disclosed in the systematic process should be publicly available in the NATO Archives or in the member states (without further reference to NATO). The disclosed information is not easily accessible online but through the relevant bureaucratic procedures. To gain actual access, the reader must go to the NATO Headquarters Reading Room in Brussels on a prearranged date – which is a highly inefficient procedure for accessing information.

According to "Transparency International" (Classified Information. A Review of Current Legislation across 15 Countries and the EU. (Corruption Risks Series. Defence and Security Programme, Transparency International, 2014, p. 81), http://ti-defence.org/wp-content/uploads/2016/03/140911-Classified-Information.pdf. Accessed 1 May 2018), the only feature which can be considered as pro-openness in NATO's transparency/secrecy policies are the restrictions on over-classification. "The NATO Security Policy prescribes that classified information 'shall be managed to ensure that it is appropriately classified [. . .] and remains classified only as long as this is necessary."

## NATO Has Limited Online Archives

The public information that NATO provides consists mainly of general knowledge materials, press releases, declarations, statements, strategic concepts, technical standards, some financial data, annual report by the Secretary General, and historical archives.

In October 2013, NATO launched the "NATO Archives Online" portal (http://archives.nato.int/) in addition to the "NATO Archives" Programme. The online platform enables access to over 42,000 of the 325,000 publicly disclosed documents, which cover the first 30 years of NATO history (1949–1982). The others, which are not available online, could be accessed for consultation at the NATO Archives Reading Room. Some series of the documents are available up to the 1990s.

Some of the files are of high historical value, for example, the information for the request of the USSR to join NATO in 1954, a report on the rising importance of China on the international stage during the Cold War, etc.

The majority of the documents disclosed online, however, are actually created by the Public Diplomacy Division of NATO and are mainly for public diplomacy purposes rather than for genuine research.

## The Decision-Making Process at NATO Is Not Transparent

NATO transparency policy is not significantly compatible with the models of a transparent organization, which require that it releases up-to-date information about its agenda and raison d'etre, data and analyses that are necessary for making informed decisions within the organization, information about the decision-making process and current activities, and financial data and information necessary for accountability purposes.

NATO has made some progress in disclosing information about its current goals and finances and produces a general accountability report. But it has done poorly with regard to the disclosure of the decision-making process and current activities.

In fact, NATO hardly publishes any original documents concerning its present activities. None of the meetings and sessions of its main bodies are publicly available. The decisions made, minutes, and other records are likewise not disclosed. There is no information about the consultations nor voting within the principal political body of the organization – the North Atlantic Council. NATO publishes hardly any analyses, reports, or other forms of information that is used for making informed decisions.

The organization does not disclose even its common budget, although it provides information about the contributions of the member countries, the total sum of the civil budget, the military budget, and the NATO Security Investment Program (NSIP). The annual defense expenditures of the member states are also publicly available with the incentive to mark the great imbalances in the financial backing of the organization.

In addition to NATO's three budgets (civil, military, and NSIP), there are also the actual contributions by the member states for the NATO-led operations, which make up NATO's most expensive budget heading. With a few exceptions, the operations are backed by nationally procured military forces and military assets such as ships, submarines, aircraft, tanks, artillery, or weapon systems that are or have been deployed in NATO missions in Kosovo, Afghanistan, and Libya. However, information as to how the costs stack up for each of these missions is in short supply (Jan Davis 2015).

## Progress Toward Better Financial Transparency

Since the Wales Summit in September 2014, NATO has been making some efforts to enhance its financial transparency.

A major step forward was the release of the first-ever audit report by the International Board of Auditors for NATO (IBAN) in July 2014. Since 2014 the organization has been releasing individual audit reports of NATO entities and their related financial statements.

In March 2016, NATO published for the first time the executive summaries of the 2016 military and civil budget recommendations.

In May 2016, the organization released data on its Security Investment Program for 2015. This is a kind of a follow-up to the highly critical "Special Report by the International Board of Auditors on the Need to Reform Governance of the NATO Security Investment Program," which is one of the very few up-to-date publicly released "unclassified" documents (published on NATO's website on June 12, 2015). The document highlights significant problems in the way NATO manages its investment program, including the lack of accountability.

Still, the problem with NATO's overall financial picture persists. In April 2016, the chairman of the IBAN Ms Lyn Sachs explained to the NATO Parliamentary Assembly that "there is not one financial picture of NATO that combines NATO's financial position, performance, cash flows and budgets relevant to all NATO bodies. There are separate financial statements from, for instance Allied Command Operations, Allied Command Transformation, the Science and Technology Organization, the International Staff, the International Military Staff and the NATO Communications and Information Agency" (Towards One Financial Statement for All Common-funded Bodies. (NATO, May 2016), https://www.nato.int/cps/en/natohq/news_131544.htm. Accessed 1 May 2018). She therefore recommended consolidating the financial statements of all common-funded NATO bodies to allow readers of the financial statements, including member states, NATO governing bodies, and the public, to have a single document that would allow them to more clearly understand the total amount of funding NATO receives and how this funding is used.

## NATO's Online TV Channel Contributes Little to Transparency

NATO has attempted to demonstrate openness with the launch of its online TV channel (NATOChannel.tv). Unlike the television of the

United Nations however, which broadcasts live of the sessions of some of the main bodies of the organization, the NATO channel presents documentaries about different NATO activities and has live broadcasting only of the press conferences or speeches of the Secretary General and other senior officials or similar events.

NATO is less transparent than the major collective security organization in contemporary world – the United Nations. The UN provides significant amounts of information concerning its decision-making process and budgeting of all of its programs. As for the classification procedures of both organizations, NATO's is more restrictive as it does not set any deadlines for the classification of many of the documents of the organization. The transparency practices of the UN have indicated that transparency can coexist with security on international level and that transparency cannot be considered an impediment to security.

## The NGO Sector Urges for Greater Openness

The insufficient transparency of NATO activities has urged different organizations to raise the issue to the public agenda.

For example, in 2014 the Netherlands Court of Audit (NCA) took the initiative to present an overview of the publicly available information on NATO's finances and its results (NATO Transparency and Public Accountability (The Netherlands Court of Audit, November 2014), https://english.rekenkamer.nl/topics/nato-transparency-and-public-accountability. Accessed 1 May 2018).

The NGO sector has also made efforts to alert and raise awareness about the problem with NATO's insufficient transparency. Examples in that regard are the "NATO Watch," "Transparency International," and "Stockholm International Peace Research Institute" (SIPRI).

In an article, the director for publications of SIPRI Dr. Jan Davis (J. Davis, On "International Right to Know Day" – How Transparent is NATO. (SIPRI, September 2015), https://www.sipri.org/commentary/expert-comment/2015/international-right-know-day-how-transparent-nato. Accessed 1 May 2018) recommends five further steps for enhancing NATO's transparency policies: sharpening national parliaments' scrutiny of NATO affairs, strengthening the democratic mandate of the NATO Parliamentary Assembly, adopting an information openness policy within NATO, publishing annual financial reports, and using the existing NATO TV Channel and YouTube presence to stream more policy dialogues, including some internal NATO meetings, to the public.

## Conclusion

Although NATO has invested a lot of efforts in explaining its disclosure rules, it is still one of the most rigid organizations when it comes to transparency. NATO is virtually nontransparent in its decision-making process. If there is any openness of NATO activities, it is mainly of historical value. The organization allows classifying of almost all of the current activities of the organization upon general criteria and upon the discretion of administrators, which makes the system prone to arbitrary classifications. The public information from the organization is poor to allow the general public to construct informed perceptions about its current activities.

Although NATO has been making efforts toward enhancing transparency in recent years, there has been limited progress. As a less transparent organization, NATO may face more and more difficulties to keep the information status quo in a growingly transparent world. As Pieter and Siemon Wezeman (P. Wezeman, S. Wezeman, Balancing Transparency and National Security. (SIPRI, January 2014), http://www.sipri.org/media/newsletter/essay/wezeman_wezeman_jan14. Accessed 1 May 2018) have noted, secrecy even in sensitive areas such as military matters is already an illusion (because "when everything is secret, nothing is secret"). According to Global Data Leak Report 2017 (Global Data Leak Report

2017. (InfoWatch, 2018), https://infowatch.com/report2017. Accessed 1 May 2018), information leaks worldwide have increased considerably in recent years. The growing interconnectedness among nations, the increasing requirements for accountability, the rise of civil society and communication technologies, and the growing dangers of cyberwarfare will continue to present serious challenges to secretive communication approaches. Effective information management in a more open world requires much more flexible approaches to communication, including both greater information security and greater transparency.

# Needs Assessment and Nonprofit Organizations

Lili Wang
School of Community Resources and Development, College of Public Service and Community Solutions, Arizona State University, Phoenix, AZ, USA

## Synonyms

Needs identification; Social needs

## Definition

Needs assessment refers to the processes and methods used by evaluators or managers to identify and describe the social needs that a program is intended to address. It is also an important tool to help improve the performance of an organization or a program.

N

## Introduction

In an era of performance management, nonprofit organizations have been increasingly relying on evaluation tools to improve their performances and program impacts. One of the commonly used evaluation tools is needs assessment. Needs assessment refers to the processes and methods used by evaluators or managers to identify and describe the social needs that a program is intended to address, which should be closely related to the organization's mission and vision. Needs assessment is also an important tool to help improve the performance of a nonprofit organization and its programs. The following sections will discuss why needs assessment is important to nonprofit organizations, how to conduct a needs assessment, and what a needs assessment can be used for in the nonprofit setting.

## Why Needs Assessment Is Important to Nonprofit Organizations

Nonprofit organizations, particularly those that provide social and human services, serve their clients through various programs, such as after-school sports programs, job training programs, and mentoring programs. The primary rationale for offering a social program is to alleviate a social problem or meet certain needs. Therefore, before designing and developing a program, nonprofit organizations need to assess the nature and the extent of a social problem, the need for an intervention, and the options to address the social issue. Diagnostic activities, or needs assessment, are a means by which nonprofit organizations can identify the type of services potential clients need and determine the scope of those needs. The findings of the needs assessment help nonprofits justify the programs they develop to their constituency, which includes the communities they serve and prospective funders. Thus, from a managerial perspective, needs assessment can guide program design and is a fundamental part of any program planning.

In addition to justifying the need for a particular program and guiding program design, needs assessment can also help nonprofit organizations prioritize programs according to their relative importance to potential clients. As nonprofit organizations often face limited resources to develop programs and deliver services, it is imperative to prioritize programs according to the social needs in order to maximize the impact of limited resources.

Sponsors and funders increasingly require nonprofit organizations to provide needs assessments and sometimes even provide assistance to promote needs assessment. For example, South Dakota's Office of Chronic Disease Prevention and Health Promotion provides technical assistance and funding through the South Dakota Good & Healthy Community Grant, which provides up to $10,000 for community health needs assessment to promote a better understanding of community health relating to chronic disease prevention and control (Good and Healthy South Dakota 2017). In another example, the State Title V Block grant program for Maternal and Child Health Services requires each state to work collaboratively with relevant organizations to conduct a statewide needs assessment every 5 years, which directly involves community-based nonprofit organizations (United States Department of Health and Human Services 2016). In an increasingly competitive funding environment, nonprofit organizations often use needs assessment as a tool to strengthen funding proposal.

In addition to the practical importance of needs assessment to nonprofit organizations, such as justifying their programs, helping with program design, prioritize programs, and securing funding, needs assessment also has theoretical importance to nonprofit management. The growing adoption and application of the needs assessment tool by nonprofit organizations suggests that nonprofit sector has entered an era of scientific decision-making – using systematic approaches for the collection of facts and applying logic to decision-making. This approach stands in contrast to decision-making based solely on experiences, intuition, and trial and error. This shift can improve the quality of nonprofit decision-making with respect to resource allocation and the achievement of mission-related goals.

## How to Conduct a Needs Assessment

There are three models of needs assessment, which include the discrepancy model, marketing model, and the decision-making model (McKillip 1987). The *discrepancy model* is the most straightforward and widely used. This strategy for needs assessment emphasizes normative expectations and involves the three phases: goal setting or identifying what ought to be, performance measurement or determining what is, and discrepancy identification or identifying differences between the goal and what is. The *marketing model* defines needs assessment as a feedback process used by organizations to learn about and to adapt to the needs of their target populations. A marketing model of needs assessment has three components. First, it involves the selection of the

target population or deciding who is actually or potentially eligible for the service. Second is committing to choice about competitive position, which means distinguishing an agency's services from those offered by other providers. Third is the development of an effective marketing mix by selecting a range and quality of services that will maximize utilization by the target population. The *decision-making model* includes three stages. The first stage is the problem modeling in which need identification takes place. The second stage is aligning quantification and measurements contained in the need identification with the values and interests of decision-makers. The third stage is synthesis, which involves an index that indicates the relative standing of the needs will be provided.

Needs assessment can be broken down into five steps (McKillip 1987). *Step 1* involves identifying users and uses of the needs assessment. The users of the needs assessment are those who will act on the basis of the results and the audiences who may be affected by it. Knowing the uses of the needs assessment can help the researcher focus on the problems and solutions that can be entertained. *Step 2* is describing the target population and the service environment. In this step, researchers will conduct client analysis to compare those who use services with those who are eligible to use services but are not served yet. Geographic dispersion, transportation, demographic characteristics of the target population, eligibility restrictions, and service capacity are important aspects to examine. Resource inventories detailing services available can identify gaps in services and complementary and competing programs. *Step 3* is identifying need. Problems of the target population and possible solutions are described in this step. Normally, three types of problems are identified by needs assessment such as discrepancies, poor outcomes, and maintenance needs. *Discrepancies* refer to differences revealed by comparison of expectations with outcomes. *Poor outcomes* refer to problems involve those at risk of developing poor outcomes. A group with *maintenance needs* can develop poor outcomes if services presently offered are withdrawn or changed. To get a complete picture of the needs, researchers typically use more than one source of information to help identify needs. Needs identification should include information on expectations for outcomes, current outcomes, and the efficacy, feasibility, and utilization of solutions. Surveys, community forums, key informant interviews, focus groups, direct observations, and social indicators are often used to collect information. *Step 4* is assessing the importance of the needs. Once problems and their solutions have been identified, needs are evaluated. *Step 5* is communicating results. The results of the needs assessment must be communicated to decision-makers, users, and other relevant audiences. The effort that goes into this step should equal that given the other steps of the needs assessment. Defining the need and specifying the target population are important steps in a needs assessment and will be elaborated in the following sections.

### Define the "Need"

Needs typically arise when stakeholders are dissatisfied with certain aspects of the existing policies and programs, such as program effectiveness, coverage, or cost, or are concerned that a new social problem has emerged (Rossi et al. 2004). To successfully conduct a needs assessment, it is critical to understand that "need" is a relative term. For example, housing needs can be defined in various ways. Housing needs may mean shelters for homeless persons, affordable housing for low-income family, housing with handicap accessibility, or housing for persons desiring more aesthetic environments or amenities. A person's perception of what is "needed" depends on his or her vantage point, which is often shaped by one's relative wealth or impoverishment. Additionally, what is viewed as a "need" changes over time (Royse et al. 2009). For example, technology advancement has made computer an essential part of our daily life. Computer literacy or the ability to use computers becomes a necessary part of many jobs. Nonprofit organizations offering job training to their clients should integrate the "need" into the program design. Furthermore, a "need" is socially constructed, which could differ in various social and cultural contexts. For

example, a healthy eating and active living program for various racial/ethnic population groups need to take into consideration the different daily food consumptions of their participants. Therefore, when discussing needs assessment, evaluators or nonprofit managers must be cognizant of the fact that what is "needed" is relative. The findings of a needs assessment largely depend on who the evaluator(s) involve in the needs assessment process and when and where the assessment is conducted. The proposed initiatives to address the need, hence, may vary widely depending on how the "need" is defined. This suggests that a clear and specific definition of the "need" can help nonprofit organizations stay focused in addressing the "need" and later evaluate the impact of a program.

When conducting needs assessment, evaluators and nonprofit managers also need to understand the two main aspects of needs assessment. *First*, needs assessment is data driven. Nonprofit organizations need to use data to demonstrate the extent of the social problem and the needs of social programs to address the issue. *Second*, needs assessment is also political. Evaluators need to involve and engage stakeholders early on and throughout the needs assessment process. Additionally, evaluators must have the public's buy-in that a social problem exists and assess the will to ameliorate the problem. A successful needs assessment should bridge the science and politics, consider the data and values of the community, and present the needs and solutions accordingly.

### Use Data to Describe the "Need"

Evaluators must use data to show the extent of needs, including the size, geographic distribution, and intensity of needs. Data could come from existing data sources or collected by the evaluator(s). Existing data sources, particularly those high-quality data sources, such as the decennial US Census, the Current Population Survey of the US Bureau of the Census data, vital statistics records, and other national or regional representative surveys, may be used with confidence to assess certain aspects of social needs. Evaluators should know whether certain good quality data exist in helping assess the needs as using existing data sources could potentially save nonprofit organizations a significant amount of cost in needs assessment. When using existing data sources, evaluators must assess the validity of the data by examining how the information was collected as low-quality data could result in poor needs assessment. Some existing data sources provide periodic measures of certain topics, such as the Current Population Survey provides annual data on the characteristics of the US population, including the composition of households, individual and household income, household members' age, gender, and race. These regularly collected measures can be used to chart historical trends which would provide us with social indicators to monitor changes in social conditions and to assess whether certain social problems or needs have improved or worsened in a certain period of time. While using existing data sources is cost-efficient, the social indicators currently available are limited in their coverage of social problems, focusing mainly on issues of poverty and employment, housing, and national program participation (Rossi et al. 2004). In addition, most existing data supports analysis at national and regional levels but cannot be disaggregated to provide useful and valid information in smaller jurisdictions, such as cities or counties. When there are no existing sources of information available to estimate the extent of needs, evaluators must collect primary data using tools such as agency records, surveys and censuses, key informant interviews/surveys, and focus groups.

Some nonprofit organizations keep excellent records on their clients, such as sociodemographic information, diagnosis, and service utilization. When one organization or several organizations' clients include all the persons manifesting the needs in the community and records are faithfully kept, evaluators can confidently use these records to estimate the community-level needs. However, in many cases, nonprofit organizations do not have complete information on all the persons experiencing a social problem. For example, homeless shelters in a city may have records of homeless people use the shelters, but it is hard to say that all homeless people in the city are in fact served by these shelters. In these cases, a better

way to estimate the need is to undertake original research using complete enumerations (censuses) or sample surveys.

Depending on the sample sizes and degree of technical complexity, such as various sampling methods, sample surveys could require a substantial amount of resources and considerable level of efforts. Designing and implementing sample surveys also could be a complicated process that requires high level of expertise and experience. Therefore, nonprofit organizations often collaborate with reputable national or regional survey agencies to carry out and analyze sample surveys (Rossi et al. 2004).

Compared to sample surveys and censuses, key informant interviews and surveys are easier to conduct but may not be the most reliable approach to estimate the extent of needs. Key informants are persons whose experience, expertise, or position should provide them with knowledge of the magnitude and distribution of the needs (Rossi et al. 2004). They can offer valuable information about the characteristics of the clients that the nonprofit organizations serve and the nature of service needs. However, studies show that key informants' estimate of the scope of needs could vary widely, which would make it hard for evaluators to come up with an accurate estimate of the service needs (Hamilton, Rabinowitz, and Alschuler, Inc. 1987). Therefore, evaluators may choose to use a key informant interview or survey when a better approach is not feasible.

Evaluators can also use focus groups to gather information for needs assessment. Before organizing focus groups, evaluators must ask who the stakeholders are or who would the needs assessment affects. The stakeholders of a nonprofit organization and its programs typically include government agencies, community partner organizations, community leaders, funders, individual donors, clients of the organization's service programs and their families, and so on. Evaluators can organize several focus groups of different stakeholders to learn about each of their perspectives on the "need." A facilitator will follow a focus group protocol to guide the discussion in a focus group session. It typically starts with an introduction of the researcher(s), an explanation of the purpose of the focus group session, ground rules, and how the focus group works. Then the facilitator will ask the participant to introduce themselves, including first name, services received and for how long, connection with the nonprofit organization and so on, followed by a discussion of additional service needs or barriers to the current services, and what can be done to overcome barriers or address needs, and then wrap up with a summary and additional questions and comments. Compared to the key informant interviews, focus groups can reach more stakeholders in the needs assessment process within a certain period of time. However, the tradeoff is that participants may not feel comfortable to share their own opinion in a group setting.

Each of the aforementioned data collection method has its strengths and limitations. An evaluator may choose the method to use for data collection based on the availability of funds and other resources, such as staff time, and how important it is to have an accurate estimate of needs (Rossi et al. 2004).

### Specify the Target Population

The target population is the clients that a specific nonprofit program intended to reach and serve. Defining the social needs and estimating the size and characteristics of a target population are key components of a needs assessment. Target population is usually individual, but it can also be groups, such as families and organizations, geographic and political areas, such as communities and cities, or physical units, such as community gardens and farmers' markets. When the target population is individual, it is usually identified in terms of individuals' social and demographic characteristics. When the target population is groups, areas, or other aggregated units, it is often defined in terms of the characteristics of the individuals that constitute them (Rossi et al. 2004). For example, an after-school program designed to help students from low-income families to improve their reading skills may target elementary schools with at least 50% of the students qualify for the federal free lunch program.

Target population can also be direct or indirect target, depending on whether nonprofit organizations directly provide services to them or indirectly through activities the program arranges. For example, a healthy eating and active living program may directly target elementary school children to educate them about healthy food and staying active. Since parents are typically the ones preparing food for children, the program may also involve the parents as indirect target population and engage them in cooking classes or health fair.

It is imperative that an evaluator clearly define the target population and specify who is included or excluded from program services. The boundaries of target population may not always be clear to program designers or other stakeholders without explanation. For example, a nonprofit organization serving homeless youth needs to specify how they define "homeless" and "youth." Does "homeless" include those living with friends or living in motels? Would those between ages of 18 and 24 be considered youth? Evaluators need to communicate with nonprofit organizations to determine the eligibility criteria. Specifications of the target population should avoid being too over-inclusive or too restrictive. If the target population is defined too restrictively, then few people would qualify for the program/service. On the other hand, if the target population is too over-inclusive, then limited resources may not reach those who need the services the most. Definition of the target population must also be feasible to apply. For example, if a nonprofit organization would like to promote community gardens in an urban senior community and the eligible participants are defined as those of 70 years or older who had at least 2 years of farming experiences growing vegetables before and would commit to plant certain types of vegetables in the garden. It would be difficult, if not impossible, to verify the farming experiences and to apply this criteria in recruiting participants.

The specification of target population and the definition of a need are closely related as stakeholders' perception of what is needed could vary by their perspectives. A thorough needs assessment would engage representatives from each group of stakeholders in the data collection process so different views of "need" are all represented.

## Uses for Needs Assessment in the Nonprofit Setting

As an evaluation tool, needs assessment can be used in numerous ways in the nonprofit setting. *First*, the findings of a needs assessment can help nonprofit organizations develop a better understanding of the service needs of the constituents they serve, which can guide and improve program design. As mentioned earlier, needs assessment is an important part of program planning. It helps to justify and prioritize program focus. *Second*, as funders increasingly require information regarding community needs in the grant application, needs assessment becomes an integral part of funding proposal. Nonprofit organizations can strengthen their grant applications by conducting needs assessments. *Third*, needs assessment can help nonprofit organizations improve their internal management and performance. In a study of nonprofit organizational effectiveness, Herman and Renz (1998) conducted group meetings with nonprofit practitioners and found that adopting various management practices, such as conducting and using needs assessment, strategic planning, measuring customer satisfaction, were likely to enhance nonprofit effectiveness. *Fourth*, needs assessment can also help the development of nonprofit workforce. As an emerging field, nonprofit leadership and management education needs to understand the important skills needed in the nonprofit sector and develop curriculum accordingly to meet the needs. Based on a survey of nonprofit leaders and the alumni and students of a nonprofit management certificate program in the United States, Wang and Ashcraft (2012) find that nonprofit managers consider leadership, ethics and values, long-term planning, funding management, conducting effective meetings, and interpersonal skills to be important for nonprofit employees, while students consider financial management, strategic planning, and fundraising and grant writing to be top skills that nonprofit

employees need trainings on. Results of the study not only help to inform the curriculum revamping of the selected program but also serve to inform the content of other educational programs within the nonprofit professional development education field.

## Conclusion

With the development of scientific management and the growing emphasis on nonprofit performance and accountability in the past few decades, needs assessment has become an important evaluation tool that helps nonprofit organizations improve various aspects of their managerial functions, such as program planning, resource development, and professional training. Therefore, it is critical for nonprofit leaders to understand why needs assessment is important, how to conduct needs assessment, and what needs assessment can be used for in the nonprofit setting.

# Neoliberal Policies and Impact on Developing Countries

Pius Gumisiriza
School of Public Policy and Governance, Uganda Management Institute, Kampala, Uganda

## Synonyms

Debts; Deregulation; Developing countries; Double standards; Economy; Free trade; Impact; Neoliberal policies; Privatization; State

## Definitions

Neoliberal policies are defined in this entry as actions or inactions that encourage free-market competition and limited government intervention in the economy such as free trade, deregulation, removal of subsidies, and privatization (see Stiglitz 2002). In this entry, developing countries are defined as countries with low levels of industrialization, financial services, and low levels of Human Development Index compared to other countries. However, this definition is not universally accepted because countries with very huge differences, for example, say Malawi and China, are categorized together as developing yet they are highly differentiated. Thus any definition or categorization has to be used carefully.

N

## Introduction

This entry uses economic theory, economic history, and critical evidence to examine double standards embedded in the assumptions, formulation, and implementation of neoliberal policies and their impact on developing countries. The overall argument made in this entry is that developed countries ardently preaching the neoliberal gospel do not preach what they practiced and do not practice what they preach. Developing countries that implemented wholesale packages of neoliberal policy prescriptions suffered and achieved less in development terms especially when compared to their counterparts that were very careful or never embraced such policies over similar periods.

## The Rise of Neoliberal Policies

In the 1930s when the Great Depression led to market system failure, John Maynard Keynes, a British economist considered the father of modern macroeconomics, came up with a theory that challenged liberalism as the best policy for capitalists. Keynes believed that left on their own, markets lead to destructive cycles of booms, recessions, and depressions. He suggested that for capitalism to grow, government should intervene to increase employment and advance the common good using fiscal and monetary measures. His ideas were widely accepted and helped rebuild Europe after World War II and created a very wealthy, profit-minded corporate and politically influential class. In many developing countries during the 1960s–1970s, governments were also implementing radical state intervention policies that often challenged the power of foreign corporations through nationalization, economic planning, import substitution, and discriminatory monetary, fiscal, and trade policies. These policies were contributing to an industrial revolution as developing countries were growing by 3% annually which compared favorably with the 1–1.5% rich countries achieved during the nineteenth-century industrial revolution (Chang 2002). However, during the late 1970s, inflation, unemployment, two oil shocks, militant labor unions, and huge state-sponsored welfare programs in developed countries advocated by the Keynesian approach could no longer be reconciled with the profit-minded corporate capitalists. Corporate interests decided that the Keynesian regulationist approach no longer worked to their advantage and an alternative ideology that would protect their profit making had to be thought. The answer was found in the old liberal ideas which included cutting state programs viewed as obstacles to profit making within the developed countries themselves, shifting service provision from the state to the profit-making private sector, and protecting the rich while letting the poor face market principles, deregulation among others. This thinking benefited and came to fruition with the election of more conservative political leaders who favored neoliberal policies: Britain (Margaret Thatcher 1979), Canada (Joe Clark 1980), the USA (Ronald Reagan 1980), and Germany (Helmut Kohl 1981). Margaret Thatcher in the UK and Ronald Reagan in the USA initiated austerity programs that consequently led to the fall in global export demand, trade deficits, and a debt crisis since most developing countries were pursuing industrialization through debt financing. This crisis tilted the balance of power in favor of donor countries, IMF, WTO, and the World Bank in the economic management of developing countries. The World Bank argued that the decline in these economies was not due to vagaries of weather, political conflict, or external shocks but poor macroeconomic and sectoral policies emanating from a development paradigm that gave the state a prominent role in the production and regulation of economic activity. The Bank listed policies and strategies such as tariffs on imports; subsidies on education, agriculture, and health; formation and protection of infant industries; and import substitution industrialization as evidence of waste and inefficiency and targeted them for dismantling. Thus, to access loans to service their debts or finances, development programs in developing countries were required by IMF and World Bank to implement SAPs that were more or less the same as neoliberal policies. In addition to adopting free trade which in actual terms meant

opening third world markets for exploitation and reducing the role of the state in the economy which also meant shifting decision-making from government to the corporate-controlled private sector, developing countries' governments were required to abandon agricultural subsidies, privatize their state-owned enterprises, introduce user fees on social services such as education and health, focus on primary rather than higher education, and limit funding on research among other policies which were all imbued with double standards as discussed hereunder (see World Bank 1994; Stiglitz 2002).

## Free-Trade Double Standards

Free trade among nations is the most central policy under the neoliberal orthodoxy whose resistance attracts the worst ostracism or excommunication from neoliberal circles (Chang 2007). The doctrine of free trade among nations which refers to the free movement of goods, services, and capital across national borders without the interference of government-imposed regulatory barriers has its theoretical origins in Adam Smith's ideas published in 1776 in his book *The Wealth of Nations*. Smith criticized the British mercantilist colonial state in America for being corrupt, self-serving, and extracting wealth by force using an expensive military apparatus. His fundamental idea was that the wealth of the nation should be derived from free exchange, and rewards should be shared between different parties to the exchange through division of labor and no party benefits at the expense of another (see Butler 2011). In this regard, Smith aimed to emphasize that free trade was a better system than the mercantile system at the time and its feudalistic legacy (see Schumacher 2012). This was later augmented by the nineteenth-century economist David Ricardo's theory of comparative advantage in which he encouraged nations to specialize in production of certain products while trading for others. He argued that free trade makes it possible for households to consume more goods regardless of whether trading partners are more or less economically advanced. Ricardo further propounded that every country has a comparative advantage for a good or service that they can produce at a lower cost than any other country. Consequently, production is maximized when each country specializes in the good or service that they produce at lowest cost and in such goods can make every country better off by expanding variety of low-cost goods to consumers through competition. Firms with lower wages and production costs can produce goods at low costs and export to other states, generating new income otherwise not possible if they only served the local market. This philosophical underpinning of free trade is very strong among Western countries' neoliberal policy makers and scholars who hypocritically believe that free trade in both commodities and capital contains all that is necessary to deliver prosperity to all and that their own ancestors used it to make their countries rich which is a misrepresentation of economic history (see Friedman 1962; Ferguson 2003). Historically the methods of international trade and wealth accumulation in the most ardent free-trade advocate countries hardly conformed to so-called free-market principles but plunder, conquest, slavery, or colonialism. Between 1493 and 1700, Spain forcibly expropriated about 51,000 metric tons of silver from its colonies in South America constituting over 80% of the total world production in that period. From 1702 to 1780 the production of gold in Spanish and Portuguese Latin American colonies averaged 20 tonnes per year, and all this gold ended up in Europe especially England, France, and Holland by means of pillage and not trade (Barrett 1990). By 1700 over 1.5 million African slaves had been transported across the Americas, and in the eighteenth century, over six million African slaves were transported. Slave labor was used to produce raw materials especially sugar and cotton, working in mines and industry to produce low-cost goods that were sold at monopoly higher prices in colonial markets after the destruction of their native producers which created super profits beyond what the world had ever experienced before for English, French, and Portuguese traders (Williams 1964). The golden age of contemporary capitalism has depended on cheap oil supply from the Arab

countries, and the desire to control these oil-supplying countries has come with many tensions and destructive conflicts in others such as Iraq. These are carefully avoided in any neoliberal discussion, or even when they are discussed, their damage is understated or seen as positive. There are also heterodox economists such as Erik Reinert, Joseph Stiglitz, Ha-Joon Chang, and distinguished linguist Noam Chomsky among others who critically reject the neoliberal open-market approach with its touting of the Smithian and Ricardian approach to global trade interaction by demonstrating that the major industrial nations advocating for free trade today did not practice it when developing their own economies but instead were the strictest protectionists in those areas where they sought to improve their productive capacity. Britain was the first country to perfect the infant industry promotion and protection strategy, which they used to propel their country to prosperity; for instance, Britain banned imports of superior products from some of its colonies if they happened to threaten British industries as in the case of Irish wool industry and the Indian cotton industry, imposed high and long-lasting tariff barriers, and controlled trade. The USA was the most ardent user of protectionism policies from 1812 up to World War II. It imposed heavy tariffs to protect its critical industries at the time especially textile industry in the early nineteenth century and the iron and steel industries in the second half of the nineteenth century (Chang 2002). If free trade especially between unequal partners benefits countries, the trade between the USA and Mexico under NAFTA would have provided the best example except that it did not. Mexico borders the USA and has a considerable amount of competent managers, skilled workers, relatively huge Foreign Direct Investments, and good infrastructure in terms of airports, roads, ports, and rail. Nevertheless, free trade under the NAFTA arrangement swallowed almost all the industries built before 1990 under the import substitution strategy. The result was lost jobs and falls in wages as better-paying manufacturing jobs disappeared, slowdown in economic growth, and disruption of its agricultural sector that employed millions which was also hit hard by subsidized US products especially corn. Without clear alternatives, many Mexicans have moved north, while others are caught up in a difficult drug war. During the 2016 US presidential elections, Candidate Trump, now President, called Mexican migrants rapists and drug dealers and promised that if elected president, he would build a wall on the border, and Mexico would pay for it, an idea he has not given up on as president. Despite this bigoted rhetoric, many Americans are as annoyed as Trump on Mexicans not as a people but on the mistakes of NAFTA on the American people. During the 1992 US presidential election debates, independent presidential candidate Ross Perot made opposition to NAFTA, the cornerstone of his national campaign, warning voters that because of huge wage differentials between the USA, Canada, and Mexico, America would lose jobs as companies move to Mexico looking for cheap labor. In the heated debate that preceded its enactment, NAFTA proponents, prominent economists, and Clinton administration officials argued that it would result in a trade surplus for the USA and also generate millions of jobs. These predictions did not happen because US trade with Mexico went from a US$ 2.5 billion surplus in 1994 to US$ 58 billion deficit in 2015, and an estimated seven hundred thousand US jobs were destroyed between NAFTA's implementation in 2010. However, NAFTA supporters look at the deficit differently and argue that the USA runs a deficit with many other trading partners such as the EU and China where it had a US$ 365 billion trade deficit in 2015. That for every one job it lost to Mexico, it lost five to China, and therefore job offshoring from the USA cannot be solely blamed on NAFTA. Besides, most imports from Mexico have US-made parts, as they are reassembled products made from the maquiladora factories; thus the deficit with China could have been worse if Mexico was out of the picture (Scott and Guillen 2014; USTR 2016). Some of the campaign pledges that President Trump made were to destroy or renegotiate trade agreements that favored other countries against the USA. Indeed he has maintained his words and renegotiated NAFTA with Mexico, imposed tariffs on some of Canadian and European goods

because he thought that these were protecting their own markets while taking advantage of the USA, and is engaged in a tit-for-tat trade war with China mainly because the latter has been winning the trading contest. However, this raises very critical questions for developing countries because the USA can afford to impose tariffs, embargo, and trade agreement renegotiations on other countries due to the fact that it is the strongest country on earth and can have its way when dealing with others. This is not the case when others are dealing with the USA which is where the double standards lay. For instance, the East African countries of Uganda and Rwanda have been trying to stop importation of secondhand clothes in attempts to promote their own domestic textile industry and dignity of their people. The USA, which is the major secondhand clothes supplier in these markets, opposed the move. Uganda capitulated but Rwanda has been planning to go ahead with the proposals, but the USA has made it very clear that if Rwanda sees this through, it will be banned from selling its own goods to the USA under the AGOA Act: an arrangement that allows selected African countries to sell certain products into the US market duty free. This kind of coercion has also been raging between South Africa and the USA over the continued dumping of chicken products into the South African market that is killing domestic chicken farmers' businesses and livelihoods. Similar threats like those leveled on Rwanda have also been pointed at South Africa. This kind of trade partnership is not free, fair or even new; for instance, the free movement of goods that developed among weaker countries under British hegemony between 1870 and 1913 was made possible mostly as a result of military might rather than market forces (Girdner and Siddiqui 2008). Trump is trying to force similar kinds of trade arrangement on others because of the US economy's might. This changes the debate from whether free trade is good or bad if at all it exists to whether it is acceptable for the strong nations to play double standards and shift goal post to make sure that trade rules favor them against others. If this is allowed to continue as the way of carrying out trade, then developing countries especially the weakest in sub-Saharan Africa have to think twice, strengthen intra-Africa trade partnerships to defend themselves of such eventualities, and reposition themselves to deal with the rising China, the post-Brexit UK, the EU, the USA, and other partners with whom they may want to sign similar agreements. Otherwise they risk being squeezed in a corner, accepting deals blindly, and may fail to reverse the already trade deficits they are running with the major trading partners.

## Double Standards on the Role of the State in the Economy

Neoliberals argue that the role of the state in the economy should be confined to creating and defending free markets, and all other functions are better discharged by private enterprise (Friedman 1970; World Bank 1994). However, virtually all of today's rich countries used state intervention to develop their economies contrary to what the neoliberal policy orthodoxy would have us believe. Britain was the first country to use state protectionism to achieve industrialization by banning importation of superior products from some of its colonies if they threatened its industries as in the case of Irish wool and Indian cotton. In the 1930s the British government turned to more direct intervention into the domestic economy and stimulated the production of machines, chemicals, steel, and aerospace. The USA which has been pretending to be the model type for free trade was in fact the most ardent user and mother country of protectionist policies. In his book *The Wealth of Nations*, Adam Smith advised Americans not to develop manufacturing arguing that any attempt to stop the importation of European-manufactured goods would obstruct instead of promote the progress of their country toward real wealth. Many Americans agreed including Thomas Jefferson, the first secretary of state and the third president. But others headed by Alexander Hamilton an aide-de-camp to George Washington in the War of Independence and the country's first treasury secretary fiercely disagreed. Finally the USA rejected Thomas Jefferson's idea of an agrarian economy and

adopted a state interventionist program of Alexander Hamilton that propelled them from being a minor agrarian power to the world's greatest superpower today. In his report on the subject of manufactures submitted to the US Congress in 1791, Hamilton argued that a backward country like the USA needed to develop, nurture, and protect its infant industries from foreign competition until when they could stand on their own feet. Hamilton recommended the use of tools that would have invited the wrath of the IMF and World Bank today if he was finance minister of a developing country today looking for loans from them and probably they would be lobbying for his removal from office. He recommended protective tariffs, import bans, subsidies, export ban on key raw materials, prizes and patents for inventions, regulation of product standards, and development of financial and transportation infrastructures. Hamilton's life was ended in 1804 at the age of 50 by his friend-turned-political rival Aaron Burr, then vice president under Thomas Jefferson, in a New York pistol contest. If he had lived for another two or more decades, Hamilton would have witnessed the full implementation of his program because from around 1812 his program provided the blueprint for US economic and industrial policy until the end of World War II. After World War II, with its industrial supremacy unchallenged, the USA started championing the cause of free trade. But even then the US government still massively invested in defense, pharmaceuticals, transistors, radars, computers, nuclear, laser technology, space industry, satellite technology, the internet, aviation, biotechnology, and nanotechnology all of which came with significant private sector spillovers. In recent years, the US government has on several occasions sacrificed free markets in order to avert crises by socializing financial and economic risk including its rescue of Chrysler Corporation in 1980, multi-billion dollar publicly funded bailouts of savings and loan banks in 1989, the hedge fund long-term capital management in 1998, the airline industry in 2001, and bank bailouts in 2008 (Chang 2007). The Prussian state, which eventually unified Germany, also pursued a range of policies including tariff, monopoly grants, and cheap supplies from royal factories to promote new industries. When Frederick the Great came to power, he installed the first blast furnace in Germany to promote steel, metals, and armaments industries and encouraged the growth of textiles, porcelain, silk, and sugar-refining industries by providing monopoly rights, trade protection, export subsidies, capital investments, and skilled workers from abroad among other things. In Japan, the restoration of the Meiji regime in 1868 started the modern industrial process. Like in Prussia, the Japanese state facilitated transfer of advanced foreign technologies; hired foreign technical advisers; established state-owned model factories notably shipbuilding, mining, steel, sugar, copper, dyestuffs and woolen textiles, and military; established a range of tariff reforms intended to protect infant industries; made imported raw materials more affordable; and extended large infrastructural development especially railway networks. In 1939 Japan kicked General Motors out of its market specifically to protect Toyota, which at the time was uncompetitive in the global market. In France, contrary to the popular image that the French state was non-interventionist, there was a tradition of state activism represented by Jean-Baptiste Colbert who was Louis XIV's long-time finance minister (1661–1683). After defeat in two World Wars, the French state acknowledged its relative economic decline and took a more vigorous role in the economy by launching compulsory take-over of key industries through nationalization and investment in strategic industries through state-owned banks and maintaining high-level industrial tariffs until the 1960s. Countries like Finland, Norway, Italy, and Austria that were all relatively backward at the end of World War II also used similar strategies to promote their industries until the 1960s, and the newly industrialized countries in East Asia were no exceptions. For example, the Singaporean government took the lead in establishing and protecting state-owned enterprises and industries during the 1960s. Because Singapore had a small domestic market, it had to rely heavily on external markets in order to develop, so it adopted a free-trade regime making it very different from other East Asian countries. However, this cannot be mistaken to mean that

Singapore pursued a laissez-faire system as many free-market economists suggest. Rather the government worked hard to attract FDI into areas that created employment, growth potential, technical contents, and value addition and consistently took a proactive role to support the competitiveness of its manufacturing sector, and by 2010, Singapore was producing the highest manufacturing value added in the world. In South Korea, the state used export restrictions for primary products, promotion of manufactured exports, subsidies, tax reductions, selective industrial investment, tax-free imports for re-export materials, and a 25-year ban on foreign cars to achieve industrialization. In the 1960s, manufactured goods made less than 10% of all output in South Korea. Today, it is one of the world's leading producers of heavy and hi-tech manufactured goods including steel, ships, cars, and computer chips among other technological items and possesses global brands like Samsung, Kia, and Hyundai. Taiwan is another Asian tiger that emerged from colonial rule with an agricultural economy and used state interventionist policies to promote textile, chemical, artificial fiber, cement, metal product, electrical machinery, and paper industries. In the long run, Taiwan centered industrial production on export products that had high income elasticity, low transportation costs, and backward and forward linkage industries. By the 1980s Taiwan graduated into an industrial economy and became the world's third largest producer of IT products in 1995 (Chang 2002).

## Double Standards in Agricultural Subsidies

Most developing countries especially those in sub-Saharan Africa depend on agriculture both for their livelihoods and export earnings. For instance, over 80% of the population in Uganda depends on subsistence agriculture for their livelihood, and over 80% of that country's export earnings are derived from agriculture. The World Bank recommended that Uganda and similar countries comparative advantage was in agriculture and they should focus on it in their development plans. However, under a bilateral agreement between the USA and the EU imposed on other WTO member countries, subsidies that distort trade must be cut, and one of the strongest World Bank aid and loan conditionalities for developing countries has been the removal of agricultural subsidies. In the case of Uganda, the removal of agricultural subsidies in the 1990s led to the collapse of the cooperative movement that was the cornerstone of agricultural development in the country. Peasant farmers who constitute over 80% of the agricultural production system were left on their own, and up to now, they are still using hand hoes to till the land. However, rich countries redesigned their subsidy systems in order to evade subsidy reductions and still provide massive agricultural sector subsidies that were over US$ 300 billion each year in 2002, which farmers in developing countries cannot compete with (see Action Aid 2002). The damage subsidies do to farmers in developing countries is illustrated using wheat, sugar, and cotton as case examples in this entry. Wheat whose global production is dominated by China, India, the USA, the UK, and EU is a staple food crop in many parts of the world including Africa. About half of all wheat and wheat flour traded on world markets comes from the EU and the USA. Wheat subsidies are decreased with one hand and increased with another. For example, the cost of producing wheat in the UK is currently higher than the price farmers receive, and if left to the market, it would no longer make sense for UK farmers to grow wheat. But UK farmers are not left to the market but produce wheat with a combination of market price support including intervention buying, export subsidies, and direct payments that contribute to production surpluses. They are compensated through direct payments under the Arable Area Payments Scheme where farmers are provided with about £30 a tonne of wheat implying that each tonne of UK wheat is dumped on international markets at about 40 percent below the cost of production and this has had a detrimental impact on farmers and food security in developing countries (Action Aid 2002). Sugar is another important export crop where many developing countries have a distinct cost advantage

over European Union producers, but EU sugar producers stay in business through subsidies that enable them to export surpluses at prices significantly below the cost of EU production causing huge problems for small-scale farmers in developing countries by eradicating their competitive advantage. Countries that make up the African, Caribbean, and Pacific group have preferential access to the EU sugar market, but even these countries in many cases run fowl of EU subsidies; for example, the sugar industry in Swaziland produces sugar at less than half the cost of EU countries but was unable to compete with EU sugar imports dumped in its market and neighboring countries leading to serious job and income losses (Action Aid 2002). Cotton is a major export cash crop in many African countries such as Benin, Burkina Faso, Mali, Chad, Zimbabwe, and Sudan. Whereas cotton constitutes a minor economic activity in industrialized countries, they produce a lot of it. For instance, the USA is the second-largest cotton producer and by far the largest exporter. During the 1960s cotton prices averaged US$ 2.31 per kilogram. During the 1990s, they averaged US$ 1.34 per kilogram and have fluctuated since 1990 falling to its lowest annual level in 30 years in 2002. These instabilities and downward movements in prices were majorly caused by subsidies granted by key cotton-producing countries led by the USA, followed by China and the EU (Gillson et al. 2004).

## Double Standards on Deregulation

Deregulation is another commandment under neoliberal orthodoxy's faith in the infallibility of free market. Milton Friedman, one of the champions of free-market model, argued that profit making is the essence of democracy and any government; no matter how popular it may be, it is regarded as being anti-democratic if it pursues anti-market policies that limit corporate profits (Friedman 1970). Regulations exist to protect human rights, safeguard the environment, and monitor corporate activities that limit their profits. Thus, the corporate demand and success at deregulation in developing countries allows corporations to maximize shareholders' profits through financial markets, natural resources' exploitation, privatized public enterprises, and strategic alliances and mergers rather than to provide public goods. Public services such as health, education, and transport are now subject to the rules of the market, which exacerbates the existence of persistent poverty, inadequate health care, and inequalities between the rich and the poor among other problems. These problems create conditions for unleashing the most brutalizing forces of capitalism as social bonds are replaced by unadulterated materialism, public concerns are understood and experienced as utterly private miseries, the social state is transformed into a militarized state, and politics becomes inextricably linked to matters of life and death mediated through the prism of fear, insecurity, exclusion, deception, and abuse of human rights and social values (Comaroff 2007). In recent years corporate lobbying and securing political influence in local, national, and international governance structures and regulatory bodies has resulted in budget cuts for regulatory agencies and repealing of regulatory laws allowing corporations to operate with fewer public which directly contribute toward the growing instability in the world economy; for example, the liberalization of the American financial market allowed the risky selling of American financial products and speculation all over the world which served American firms well but imposed acute financial and economic crisis in many developing countries. These speculative profit-mongering firms pack their accounts and leave developing countries in trouble every time there are hitches; for instance, Chile is the country that has been constantly cited as a neoliberal success story, but its early experiment with neoliberalism was a disaster that ended in a terrible financial crash in 1982, which had to be resolved by the nationalization of the whole banking sector. When the 1997 financial crisis broke out as a result of the devaluation of the Thai baht, investors rushed out of the East Asian emerging market which devastated currencies, stock markets, and economies of the region. In Argentina, neoliberal aftershocks started to be felt after a prolonged

recession in 1999 at the beginning of President De la Rua's presidency. Foreign investors left the country as fast as they had entered it when it became clear that the economy had fallen apart and the IMF wasted no time to suspend its assistance. The state defaulted on billions of dollars, and over half of the population fell below poverty line with 20 percent not being able to even afford daily food costs in a country that once took pride in having the largest middle class in Latin America (see Shever 2012).

## Double Standards in Privatization

Privatization, which refers to the transfer of ownership or control of state-owned resources or services to private companies, has been the primary focus of neoliberal or free-market policy since the 1980s. Until this very recent period in history, public resources were largely in the hands of local communities and nations who would distribute their benefits throughout society without an overriding profit imperative. With key commodity, agricultural, and manufacturing markets already dominated by a handful of corporations, privatization has opened up a seemingly endless array of profitable opportunities. Neoliberals claim that privatized services are more efficient than those run by the state. They believe that market competition and corporate efficiency can drive prices down for consumers. These arguments are used as a sales tool to convince the public and their governments. However, these assumptions are basically incorrect and often irrelevant when considering the functions and purposes of public utilities. Essential services are provided to citizens by their governments to meet basic public welfare needs such as the provision of energy, water, and health care. The provision of these services is a human right, and whether they are profitable or not is not a concern for the vast majority of people around the world. There is also little empirical evidence that privately run services are either more efficient or better value to their customers or more evident of damage. For example, privatization usually creates a natural monopoly, removing the possibility of competition that can benefit the consumer. In many sectors, such as energy, multinational corporations hold the reigns to the market, and through their strategic alliances, they control critical aspects of the market such as price – again removing any theoretical market benefits. When consumer prices are reduced or a corporation tries to increase profit levels, it often comes at the expense of decent wages, labor standards, and the environment. Other main issues are those relating to human rights, democracy, ownership, control, and accountability. The provision of essential services is a human right, although many in the developing world go without basic services. Where services are available, it is in the community's interest that government body manages the utility. But corporations are accountable to shareholders whose priority is profit and not the public whose priority is service. Privatization lobbyists often cite corruption within governments as a major reason for the lack of essential goods and services such as water and suggesting that in such cases government efforts must be superseded by private provision. However, it reveals double standards when corporations want to negotiate massive private contracts with these so-called corrupt governments, many of which have fewer resources than these transnational corporations. These government failures must also be viewed in historical perspective and in terms of a country's current level of impoverishment. Further analysis often reveals more complex causes to this impoverishment. These range from unique environmental conditions, such as the lack of proximity to water in sub-Saharan Africa, to the cumulative effect of colonization, political interference, and unfair trade structures imposed by dominant countries. In such countries, corporations reinforce corrupt practices by bribing government officials when trying to secure the assets to be privatized. When essential services are privatized, the market sets prices, and those who cannot afford to pay go without. This is simply unacceptable when 45% of the global public struggle to survive on US$ 2 a day. Poverty reduction and development can only occur when these basic services that are often unavailable in poverty-stricken areas are guaranteed to all.

Government commitment to provide basic human needs was affirmed in the UN Universal Declaration of Human Rights, and as such government's relinquishment of essential services to market forces and private interests due to neoliberal pressure is a violation of human rights (see Tabellini 2005). In many developing countries, most privatized industries failed to live up to the hyped expectation of private sector-led efficiency and growth; for example, Uganda privatized virtually all its state-owned enterprises in the guise that they were inefficient and that the private sector was better positioned to champion efficiency, growth, and industrial transformation. However, most privatized public industries and enterprises have closed down; others are operating in serious losses while others survive on state subsidies.

## Double Standards in Neoliberal Education Policies

The neoliberal vision sees education as a commodity like any other and therefore should be paid by the consumer. Developing countries were advised that their best returns would come from basic education and that free higher education was not pertinent to their reality. The argument was that offering free higher education meant subsidizing the wrong people who cannot produce original knowledge and for whom research is an unacceptable luxury. The World Bank insisted on only funding basic education and consistently demanded that universities slash subsidies to students and dramatically increase tuition fees (World Bank 1995). This has decapitated developing countries' universities' ability to carry out autonomous indigenous research, seriously affected the quality of teachers in the primary and secondary schools who are teaching in these countries' universities, and deepened the gulf in scientific and technological experts between developed and developing countries. Developing countries have three-fourths of the world's population but only 10% of the world's engineers and scientists: 7% in Asia, 1.8% in Latin America, 0.9% in Arab countries, and 0.3% in Africa. These countries have only 3% of the world's computers and only invest US$ 3 billion in research and development. On the other hand, the USA, European Union, and Japan alone have 90% of the world scientists and engineers and invested approximately US$ 220 billion in research and development every year. This gulf is complicated and devastates developing countries because the demand for high-technology manufactured products is increasing at a far much higher rate per year compared to the demand for low-technology manufactures. This has resulted in slow but relentless production of people in developing countries incapable of competing for twenty-first-century jobs and stuck in poverty. On the other side, this scientific and technological innovation in few places has led to concentration of wealth in the hands of a very small proportion of the global population. The UNDP Human Development Report of 2005 indicated that only nine countries (with 4% of the world's population) had reduced the wealth gap between rich and poor, while 80% of the world's populations had recorded an increase in wealth inequality. The report also stated that the richest 50 individuals in the world had a combined income greater than that of 416 million poorest people and 54% of global income went to the richest 10% of the world's population while 40% of the world's population received only 5% of global income. Recently British organization indicated that 85 richest people in the world have the same wealth as 3.5 billion poor people. The current numbers are even more frightening because the market value of, for example, Facebook, Apple, and Amazon companies combined is bigger than the entire GDP of Africa, which represents the biggest attack on the world population for the last 40 years. This kind of violence that takes the form of very few individuals, companies, or countries amassing a lot of wealth while millions of people are wallowing in humiliating poverty is partly responsible for the current immigration crisis of people trying to cross the Mediterranean Sea from Africa into Europe, the migration crisis on the border between Mexico and the USA as people try to escape poverty and drugs in South America into the USA, the increase

of racism and rise of far-right groups especially in Europe as they try to oppose this wave of immigration, the collapse of social safety nets in many developing countries, and state brutality in countries like Uganda where the government is trying to suppress millions of unemployed youth who are being inspired by Hon. Kyagulanyi Robert aka Bobi Wine, a ghetto singer turned politician to rise up and demand a better life.

## Economic and Export Growth, FDI, and Debt Payment

Proponents of neoliberal policies argued that opening up of third world economies would attract foreign direct investment, create jobs that would stimulate economic growth, and generate exports that would also generate funds to finance developing countries' debts. However, analysis of outcomes on these arguments reveals that the policy results have been resounding failures on all the mentioned fronts. Contrary to the neoliberal claim, private foreign capital inflows follow rather than create growth, and in recent years, most of the FDI heading to developing countries went to China that moreover never followed orthodoxy neoliberal policies. The belief that neoliberal policies would promote economic growth has been proved wrong, and in instances where it happened which is rare, benefits accrued disproportionately to those at the top, and growth was not followed by jobs. Excluding China, annual economic growth in developing countries between 1960 and 1980 was 3.2%. This dropped drastically between 1980 and 2000 to a mere 0.7%, yet this was the time when neoliberalism was most prevalent in global economic policy. Interestingly, China whose economic growth per capita grew to over 8% between 1980 and 2000 was not following the neoliberal model during these periods and has moved on to become the world's second biggest economy. The world experienced dramatic increase in exports from about 3.5 trillion in 1990 to 6.5 trillion US dollars in 2000. The proponents of neoliberal policies claimed that the increase in exports of manufactured goods showed the benefits of trade liberalization. However, about one-third of the world exports in goods and non-factor services do take the form of intra-firm trade between parent multinational corporations and their foreign affiliates. Moreover, the powers of these top MNCs have become much more consolidated by their closer alliance with the international banks. In this situation, citizens of developing countries are forced into dependency upon foreign companies and their goods and services (UNCTAD 2005). Even worse for the majority of the developing nations is the fact that only a handful of developing countries such as China and few other East Asian countries account for the bulk of this export growth. Moreover those countries did not follow neoliberal policy orthodoxy, and most developing countries that implemented neoliberal policies witnessed a decline in exports when there was increase in exports globally. During 1980–2005, most of the Latin American and sub-Saharan countries continued to import more than they exported, resulting in ever-growing trade deficits that forced them to cut down drastically fiscal spending, which adversely affected overall growth. The trend of trade deficit especially in Africa with Western and Asian countries has not been reversed, and Africa was the real theater for the implementation of neoliberal policies. The implication of this is that African countries never reduced their debt through increased exports but rather increased it. Indeed by 1996 sub-Saharan Africa had a higher debt as percentage of GNP than any other major third world region at US$ 230 billion which was a 400% increase that happened in the neoliberal policies era (Chang 2002). Africa's debt was forgiven at the beginning of the early 2000s but has since mounted especially with unrestricted borrowing from China by African governments. If this borrowing is not matched with investment in productive sectors so that Africa reduces its export deficits, paying back these debts will be impossible.

## Conclusion

Based on evidence in many countries discussed above, this entry concludes that while neoliberal

policies are ideologically very seductive and appealing, in practice they have not achieved what they promised and are now part of the problem rather than the solution to the development crisis in developing countries. They embody erroneous assumptions based on intuition and assertion rather than rigorous analysis. Their strength rests on their ideological appeal rather than support by any economic theory and evidence. They have failed to end poverty in developing countries where they were viciously implemented and increased inequality within and among countries, and people like President Trump in the USA are fighting hard although using unconventional methods to address or limit their consequences in their own countries. Leaders in developing countries have to think about new approaches to enhance equitable and sustainable prosperity for all their people and the next generation because neoliberal policies cannot be replicated for the next generation.

# Nepal's Policies Toward Agrarian Reform

Niraj Acharya
Deonar, Mumbai, India

## Synonyms

Agrarian reform; Land policy; Land reform; Nepal's agrarian policies

## Definitions

Agrarian question of Nepal: Major portion of population in Nepal is engaged in agriculture but due to various socioeconomic issues, the agricultural product is not even sufficient to feed the population itself.

Maoist armed revolution: The 10-year long Communist Party of Nepal (Maoist) launched a guerrilla warfare armed revolution where "land to the tiller" was one of the major demand.

Guthi: The community group of a religious institution, mainly Hindus, which own a large chunk of land and most of these lands are still to come under the state's taxation system.

## Introduction

Agrarian question is important to solve in developing countries because land is not only the source of economy but also the source of power, hierarchy, and the process of production. Rural population which consists the major section of population in developing countries are highly dependent on agriculture, but since they do not own or own only insignificant part of the major means of production, i.e., land, they are highly vulnerable to poverty as they do not have enough credit opportunities to acquire the means of production, or illiterate to use the modern technologies to increase their production (Griffin 1979). Every country has gone through their agrarian dilemma and those who have been able to break that question have been able to develop their overall economy.

One of the major characteristics of Nepalese economy is the growing food deficit and dependence on neighboring countries for the basic agro products. In Nepal, since state did not interfere in the lands which were given to few elites for the contribution they provided to palace in terms of territorial expansion or simply serving the palace, these lands were cultivated by peasants who would in return pay levy either in the form of food grain or cash (Sharma 1983). Only after the Birta abolishment act of 1959, the land grant system was abolished and state took control on the administration of land. But till today, the state has been unable to introduce the revolutionary land reform policies which would break the semi-feudal structure of land holding nurtured during the 250 years of monarchy.

## Theoretical Premise

The agrarian question has been tried to address in various ways or the various approaches. The Marxian political economic analysis of land reform takes the abolition of feudal landlordism as one of the major answers (Byres 1986); however, some scholars like Lipton (2009) argues that poverty alleviation should be one of the major motives for land reform. Also Neoliberal economic approach in many developing countries, particularly after structural adjustment policy, has been to increase the output and develop the

market for agriculture reform. Land reform basically states about the reform of the land ownership, hence Marxist thinkers have tried to define land reform as a breaking of feudal/semifeudal ownership of land. The sufficient landholding size to poor people in rural economy can contribute to the whole national economy as: (a) It increases the income of agricultural labor (large portion of land divided into many individual families would require more people to work), (b) People owning their own land would increase their income compared to them working in someone else's field, (c) The equal distribution of land makes it easier to invest more in land which would increase the productivity through technological advancement, and (d) Equal distribution of land would end the inequality of assets among people (Lipton 2009). This entry is based on the theoretical premise of redistributive approach and has included those acts and policies which had prioritized in redistribution of land to the landless class.

## Nepal's Agrarian Question

Coming toward the middle of eighteenth century, Nepal was settled by different migrants and the hill tribes sharing different culture and socioeconomic structure. By the middle of the eighteenth century, it was already divided into about 60 principalities (Regmi 2014). They were primarily Baise and Chaubise Rajya in the western part, Makwanpur in the south, Vijaypur in the east, and Kathmandu principalities consisting of Kantipur, Badgao and Patan, and Gorkha. Though these principalities had different tribal and cultural groups, they somehow shared the same kind of socioeconomic structure and land was the major economic resources for all of them. They all followed the similar structure of land holding, and the state was the primary owner of land in all principalities. Though not the primary source which would generate the power, land was the instrument through which rulers would hold the power and powerful people. The lands were than distributed to the palace's close relatives, military, and people who hold the strong religious position in the society in the form of different land grants. These distributions of land led to the development of certain structure of land holding in that period which still determines the agrarian condition of Nepal. In fact, the major form of land tenure that started in the fifth century was followed till twentieth century, and these tenures were practiced to control the power by the palace or the rulers. Also, the land distribution that the state had incorporated favored heavily to the people close to palace and establishment; hence, most of the segment of population remained poor and landless.

Nepal has gone through various political movements with the involvement of peasants which has gained the political freedom and democracy. Although these major political movements (1951, 1990, and 2006) did change the political structure with the help of participation from large number of peasants, the political commitment made to them has not been implied by the political leaders. Major share of population in Nepal depends on agriculture, but one of the primary problems of Nepal's economy is the low agricultural productivity which is due to the high amount of landlessness among its people. The feudal structure of Nepal which was nurtured during the 240-year-long monarchy has made Nepal among those countries where uneven share of land ownership is so high that agrarian question cannot be dealt without proper addressing of the uneven distribution of land.

## State Policies Toward Land Reform

The period 1951–1964, the immediate period after abolishment of century long Rana Regime, was a period of various reforms be it a transition coalition government, Congress majority government, or the king's panchayat regime which was enforced in 1960. As Nepal had not had any kind of census or the surveys and the lands were occupied by the ruling elites, to first reform the agriculture which was the major occupation of the majority of population was the priority to every government formed after the establishment of democracy. During the period of 1951–1959, some major steps were taken to change the feudal kinship agrarian

structure. The abolishment of the land grant system which had already defined the structure of land holding in Nepal and to address the rights of tenants were the immediate action to be taken. The abolishment of certain land tenure systems such as Jagir tenure in 1951, Birta tenure in 1959, Rajya tenure in 1961, and Rakam tenure in 1963 showed the eagerness of those governments to get over the prevailing agrarian structure. Though the major objective of these kinds of abolishment was to bring the land under the direct ownership of state and in some extent to remove the intermediaries of land, the abolishment acts were hugely unsuccessful in converting these lands into the Raikar land due to the lack of data of these lands. The Nepal tenancy rights and Security Act which tried to secure the rights of tenants was promulgated only in 1951 and in the Kathmandu valley (Zaman 1973). Besides this, the period from 1951 to 1959 saw the introduction of various land related acts (Badal Commission Report 1995):

(a) **Draft tenancy right bill in 1952 (2008 B.S.)**: This bill was introduced after taking the suggestions from the peasants themselves. Also this bill was important to know about the tenancy rights of tenants immediately after the Rana regime.

(b) **Land inspection commission, 1952 (2008 B.S.)**: This commission was formed to explore about the land conditions of different, five to six, districts in western Terai. Though there were several recommendations by this commission, it was not implemented by the government.

(c) **Land reform commission, 1953 (2009 B.S.)**: In 1953, under the chairmanship of Narad Muni Thulung, a royal land reform commission was formed. For the first time, the issues of peasant's rights were acknowledged in the commission's recommendation, but again the then government did not make policies and acts to implement the recommendation. The commission had recommended several reform policies such as land ceilings, tenancy rights, systematization of revenue collection, etc., but since those recommendations were being made for the first time and it would affect the royal and Rana families directly, the royal government was not interested in implementing the recommendation.

(d) **13-point plan, 1956 (2011/12 B.S.)**: In view of forthcoming election, to get the support of peasants, King Mahendra declared the 13-point plan for the agrarian reform. Certain rights were mentioned in the plan and even the establishment of cooperative agriculture bank was mentioned.

(e) **Land related act 1958 (2013/14 B.S.)**: This land act also tried to establish the tenancy rights particularly related with the rent tenants have to pay and their cultivation rights. A limit in rent was declared which made tenants not to pay more than half of their yearly cultivation. However, this land act also tried to secure the rights of land owners as a provision, and to take permission for transfer of tenancy was introduced in this act.

(f) **Birta abolishment act, 1959 (2016 B.S.)**: The 1959 election unexpectedly made the Nepali Congress major parliamentary party and the party had included land reform as one of the primary agenda during the revolution and election; B.P. Koirala introduced the Birta abolishment act immediately after taking oath as prime minister (Paudel 2015). The major objective of that act was to end the provision of land grant system and bring all those Birta lands which were given by previous rulers into the Raikar system. As many of these Birta land were tax free, the government decided to bring all those lands into the tax system and noncultivable Birta lands such as forest into the ownership of state. This act was a milestone in changing the agrarian condition of Nepal as the major distribution system of land was completely abolished and all the lands would come under the state's revenue system.

(g) **The land act 1964 (Bhumi Ain, 2021)**: After King Mahendra seized the power and introduced "Panchayat" system in 1960, to legitimize the move and show the sincerity toward peasants, royal government introduced the detailed land act in 1964. It was in some way a revolutionary step by the King as for the first time in Nepal's land history the land ceiling was

imposed and tenant's credit rights were mentioned. The major objectives mentioned in the land act were to lawfully distribute the land, to improve the living standards of peasants by introducing modern techniques, to increase the agricultural production and to transfer the inactive capital from agriculture into other economic sectors (Badal/HLLRC 2010). The major provisions made in the land act were (1) to impose of ceiling on land ownership, acquire those lands in excess to ceiling, and distribute to others, (2) abolishment of the Jimidary system, (3) give security to tenant farmers, and (4) made the provision for agricultural credit (Zaman 1973). The provisions of land ceiling were introduced for the first time and an individual was not allowed to keep land holding as decided by the land act (Table 1).

The land act was implemented in three phases in different districts (Zaman 1973), and the exemption of certain institutions from the ceilings was taken as an opportunity by the feudal landlords. The most significant trend promoted by the state was transferring the cultivable land for industrial or medical purpose. Due to this, by the end of three phases, the state was able to confiscate approximately 50,000 ha of land which was just 3% of the total cultivable land (Regmi 2014; Table 2).

Besides the introduction of land act, there were few other acts introduced during the partyless Panchayat system (Adhikari 2008).

(h) **Land survey and measurement act, 1962**: for classifying and measuring the existing land system.

(i) **Guthi act, 1976**: to regulate the Guthi land which were owned by ruling families and individual communities.

(j) **Land revenue act, 1977**: to collect the revenues from the cultivable land.

(k) **Land acquisition act, 1977**: to acquire the private excess land for public use.

Besides the various land reform policies and acts, Nepal government started prioritizing agriculture visibly in the periodic plan since 2002, when the Maoist armed struggle was at its peak. The tenth 5-year plan (2002–2007) which became the last plan of the monarchial kingdom also prioritized agriculture as the major means to reduce the poverty. The plan mentioned that major reason of poverty was the low agricultural productivity and also stated that 25% of lowest income people owned only 11% of year-around irrigated land. However, it did not mention about the measures to address this uneven distribution of land. The plan focused on increasing agricultural growth by 5% till 2007, but focused its strategy on modernization of agriculture and availability of improved seeds and fertilizers.

After the change in political scenario after 2006, there was an urgency to make the new economic policy according to the changed political scenario. Hence the National Planning Commission formulated the interim 3-year plan. As per the commission, to ensure the immediate benefit to people from the new political system, a short-term plan was designed. The plan acknowledged that the major problems in land reform were limited access to land, landless ness, tenancy, and the

**Nepal's Policies Toward Agrarian Reform, Table 1** Land Ceiling fixed in 1964

| | Ceiling | Add for housing |
|---|---|---|
| Hills/mountains | 80 rop (4.07 ha) | 16 rop (0.8 ha) |
| Kathmandu valley | 50 rop (2.54 ha) | 8 rop (0.4 ha) |
| Terai and inner Terai | 25 biga (16.93 ha) | 3 biga (2.30 ha) |

| Far-western | 2 | 3263 |
| Total | 14 | 47,803 |

Source: Hadbandi, CSRC (not dated)

increasing fallowness, i.e., cultivable lands being left uncultivated. While the average agricultural growth was 3.2%, the plan intended to raise the agricultural growth up to 3.6% (11th Interim economic plan, 2007). The plan targeted to provide land to the 200,000 landless families and also provide ownership certificate to them. The national plan also recommended new ceiling to be put, which was also recommended in the two commissions set thereafter.

The 12th plan (2010–2013) estimated that around 74% of the population still depends upon agriculture as a major source of livelihood. However, the agricultural growth was not as per the target. As per the plan, the major problems were the outdated policies and acts, lack of implementation of acts and policies, increasing fragmentation of land, use of agricultural land for the nonagricultural purpose, minimal financial and technical assistance to the peasants, existing tenancy of land, etc. However, the 13th plan was more targeted toward increasing the agricultural productivity and ignored the fact that the major reason of low agricultural growth was the uneven distribution of land and large segment of population still being landless.

The 13th plan (2013–2016) for economic growth has taken the objective of reducing poverty to 18% and increase the agricultural growth up to 4.5%. The strategy for 3-year plan included different measures to increase agriculture production through improved seeds and fertilizers, expansion of irrigation facilities, different modern technologies and mechanism, but the strategy has not mentioned about the specific programs to end the tenancy or increase the land holding portion among marginalized and landless peasants.

The provision of land classification and ownership was first introduced in the 12th plan of 2010. In 2010, Nepal government also introduced the Land Use Policy 2010, in order to stop the growing conversion of agricultural land for the use of nonproductive sector such as housing and industry. The major objective of Land Use Policy 2010, was to utilize the available lands as per their nature for better productivity, classify lands according to their characteristics (productivity, geography, soil, etc.), and conserve or manage these classified land properly.

## Conclusion

Agriculture and land reform has always been a priority for political parties of Nepal in paper. Almost every party had included land reform programs in their election manifestos. Nepal's decade-long insurgency had also regarded unequal distribution of land as one of the major root cause for poverty and raised the slogan "land to the tiller" during the conflict. However, political instability and frequent change in government has destabilized the specific programs launched by specific governments regarding land reform. Nepal's agriculture is still struggling to find appropriate measures to improve, though there has been adequate priority for agricultural growth in different yearly plans of government.

The Maoist-led armed revolution raised the slogan of "land to the tiller" in the rural areas and the "people's army" started confiscating the land from the landlords. But it was an armed coercion where state could not interfere due to the stronghold of Maoist in rural areas. One of the major agenda of Maoist revolution was the upbringing of peasants. Based on this agenda among others, Maoist got a majority in first CA election. It, without delay, formed the high-level commission for land reform under Haribol Gajurel. The commission was replaced before a report could have been submitted. It was replaced by another high-level land reform commission formed by UML government under Ghanendra Basnet. Both commissions submitted their reports in 2011; however, the intraparty conflict and political instability barred the implementation of any such reformist policy. Nepal currently looms around the institutionalization of the political achievement of 2006 such as federalism, implementation of new constitution, republicanism, and secularism; hence, the political party's commitment is not seen in the issue of land reform.

As land reform is about restructuring the economic and political influence, though it would benefit the large segment of population who

have made the political party to win election or instigating change, the political parties cannot go against the elite class whose financial support had made them perform excellently in the election. The political nexus of landlords to the establishment is strong enough to create the disruption for any government to impose certain land reform policies (Tai 1974). The large number of population is landless and prone to poverty due to unavailability of any alternative means of livelihood in Nepal. The whole agriculture advancement is still in primitive stage, making Nepal prone to food security. However, the agriculture revolution is not possible without breaking the deep rooted feudal land holding structure. Since Nepal has reached into the political stability through the latest election, the communist government of Nepal should prioritize land reform as their major economic agenda for coming days.

# Network Administration: Benchmarking e-Government in Togo

Lijun Chen and Apetogbo Komlan Aklikokou
School of Public Affairs, Zhejiang University, Hangzhou, China

## Synonyms

Digital government; Electronic government; Internet age; Public administration modernization

## Definition

The use of information communication technologies in government activities; the delivery of public services through the Internet; the availability of government information online.

## Introduction

The modernization of public service delivery through ICTs known as e-government is increasingly reshaping the traditional way of governance and public administration with less bureaucracy. As a matter of fact, citizens are progressively being able to access information and services online. While there are quite a few broad analysis of e-government in developing countries especially Sub-Saharan African countries, there is very little to learn about e-government in the Togolese context. In recent years there have been lots of efforts in Togo to provide e-government services with government to government, government to citizens, and government to business. This research provides a concrete benchmark and analysis of e-government in Togo by evaluating the

public institution websites in terms of maintenance, navigation, content, and organization contacts. This study focuses only on central government departments and agencies, because with seven millions population, Togo is relatively small to put much emphasis on subcentral government agencies websites. Actually, subcentral government plays a critical role in larger countries (Holliday and Yep 2005).

The following parts of this paper are structured as follows. The next section describes the Togolese Internet services and public administration modernization in Togo. Another section provides account of e-government development measurement. The following sections include the methods employed and the results. Discussions, which are descriptive in nature, are provided in the last section with a brief conclusion at the end.

## Internet Services and Public Administration Modernization in Togo

Since it has become evident to make use of ICTs in public service delivery, Moon and Welch (2005) attest that governments have developed web portals to provide various online programs such as online public information dissemination, online public services, online financial transactions, and online public participation.

The first Internet connection in Togo can be traced back to the year 1997, when Togo became one of the first West African Francophone countries to have access to the Internet. With the intention of modernizing the public administration in Togo, the government adopted in early 2012 a proposition from the then Post and Telecommunications Ministry now Post and Digital Economy Ministry. A concessional loan was therefore secured from China Exim Bank to finance the deployment of the e-government network in Togo with the phase 1 of the project connecting more than 500 administrative sites already completed. Ministries, government agencies, public and private institutions, hospitals, and schools are being interconnected from 219 sites in the capital Lome and Kara. The objective of the second phase of the project is to connect all the remaining part of the country.

A comparative analysis of E-Government Development Index (EGDI) shows a progress of Togo since 2012 (Graph 1). As at 2016, Togo's index ranks above the average in Africa but still far below the world average. The 2016 United Nations E-Government Survey actually classified Togo as a medium-level EGDI, ranking 147th in

**Network Administration: Benchmarking e-Government in Togo, Graph 1** Comparative e-government development

the world (United Nations Department of Economic and Social Affairs [UNDESA] 2016).

## Measuring e-Government Development

There have been many e-government benchmarking studies (Holliday and Yep 2005) aiming at measuring the extent of e-government development in different parts of the world. A periodic survey conducted by the Department of Economic and Social Affairs of the United Nations provides an index known as the E-Government Development Index which ranks countries based on three factors, online service, human capital, and telecommunication infrastructure. The survey measures countries' e-government development by categorizing their online presence in five stages: emerging, enhanced, interactive, transactional, and seamless (United Nations/American Society for Public Administration [UN/ASPA] 2002). The National Audit Office (2002), for their part, surveyed British government websites based on five stages including a basic site, electronic publishing, interactive e-publishing, a transactional website, and joined-up e-governance. Layne and Lee (2001) also developed a four-stage model to assess the stages of e-government development. In general all these models include but are not limited to an information stage with website providing basic information described by West (2004) as a billboard stage where public authorities consider government websites the same as highway billboards because information is displayed in a static mechanism way. At this stage, the website provides basic information, agencies' contact like email, and downloadable documents. Special features like FAQs may also be found in some rare cases (UN/ASPA 2002). Reddick (2004) describes this stage as cataloging of information, whereby the nature of the information is non-transactional. An interaction stage is described by Moon (2002) as two-way communication (request and response) stage. West (2004) adds that the interactive aspects of online public services allow both citizens and civil servants to send and receive information. Agencies' forms are all downloadable, with possibility of submitting online (National Audit Office 2002) a transaction stage, where users can conduct and complete transactions online. At this stage, the website provides services and forms online and databases which support online transactions for citizens. This stage offers complete and secure transactions where users can actually pay online for services (UN/ASPA 2002). Described by Reddick (2004) as the transaction phase, government allows citizens to transact electronically including case handling, decision, and delivery, allowing electronic payment of service fees and fines. Online submission of tax returns and electronic payment of taxes are very cost-effective and enhance efficiency (Edmiston 2003). Online transactions improve efficiency for both users and the government compared to the first stage. This stage actually empowers citizens to deal with government online anytime and saves the inconvenience of traveling to a government office and the time spent waiting in line (Reddick 2004) and a fully integrated, seamless or transformation stage where a one-stop portal provides all kinds of available services to users.

## Methodology

To assess the progress of e-government in Togo, an evaluation of websites was carried out. Website evaluation is a useful benchmarking tool as it determines the effectiveness of government website, the degree to which the website adds value to the organization, and it provides trend data to assess change over time (UN/ASPA 2002). A survey of public institution websites was undertook from early March to mid-April 2018, covering 35 institutions including all 23 government ministries and 12 agencies with functional websites (Table 1), out of a total of 62 surveyed found in the directory of the government portal www.service-public.gouv.tg. The methods of this study were inspired by the works of Holliday and Yep (2005), who adapted the methodology used in the survey of British government agencies websites by the National Audit Office (2002). Thirty-two coded variables were used in this study instead of the 50 used by Holliday and Yep (2005) in their survey of Chinese

government agencies websites. In line with the purpose of this study, some of the variables were removed, others combined into a single variable due to ambiguity after translation in French, while variables like online contact form, downloadable documents, and Twitter/Facebook account were added. Page structure was also not evaluated in this study.

## Results

Out of the 62 institutions surveyed, 35 have an online presence (Table 1), 7 agencies share the same website as their supervising ministries, 1 agency website is nonoperational, and 19 agencies have no web presence. The results are segmented in five categories including site

maintenance, site navigation, site content, links, and contacting the organization.

Under site maintenance (Table 2), updates and news and press release were available on all the websites evaluated even though the frequency of their maintenance can be questionable. Chat room was only available on one website, resulting in a very poor score.

In terms of site navigation (Table 3), only site map scores poorly, while five variables over ten under site content (Table 4) score very high. Financial transaction was not available on any of the websites evaluated.

Less than 50% of the websites evaluated provided links to supervised departments and only 14% to supervising departments (Table 5). In the domain of contacting the organization (Table 6), 20 out of 23 ministries websites provided a biography of senior official, while all of them have a Twitter/Facebook account. Telephone, address, fax, and email were however available on almost all the public service agencies as opposed to the ministries.

## Discussion and Implications

The e-government has become a development indicator, helping advance the delivery of basic public services ranging from education and health to finance and social welfare and playing a critical role in making institutions more inclusive, transparent, and effective (UNDESA 2016). Unlike traditional structures, the availability of basic public services online allows citizens to have access to services 24 h a day and 7 days a week. Citizens can seek and get information at their own convenience and not just when offices are open (West 2004). Actually, answering basic questions about government services and procedures is time-consuming. By examining the results, all the 35 websites evaluated provide basic information and downloadable documents. Web presence

is beneficial to government because citizens' convenience could be increased and frontline employees' workload reduced (Layne and Lee 2001). With the government's web presence, citizens learn the specifics of policies and procedures and find out where to go for government services and post-service support. The existence of online contact form, free email subscription, and social media accounts facilitate interaction between citizens and their public authorities. Each ministry and public service agencies surveyed had their telephone, address, and email contacts available on the www.service-public.gov.tg portal, with few having them on their own websites. It is necessary to also have these contacts on the institution's own website. The emergence of social media makes interaction between public authorities and citizens easier. As such public authorities should take advantage of such opportunity which bring them closer to their citizenry. The possibility of e-service in the case of tax and revenues authority, General Office of National Documentation, and National Social Security Fund offers transactional capacities to service users. The fact that citizens could fill income and corporate taxes and apply or renew their passports online in Togo is a major step. This suggests that the e-government in Togo is progressively becoming fully functional. Layne and Lee (2001) suggest that only fully functional online services will make service delivery more efficient and also increase savings for both government and citizenry. Such possibilities ought to be extended to other agencies in order to achieve a high level of sophistication of online services across all public service providers. As a matter of fact, an e-government portal site that only offered the user information would be a poor resource. The evaluation of websites proves that e-government in Togo has achieved the information and interaction stages and has partly reached a transactional stage. Only the online payment option will make it fully transactional. The emergence of mobile-money applications in Togo will effectively support that. The intention behind e-government is that sites should be transactional, that is, the user should be able to conduct a number of transactions such as paying, applying (e.g., for a parking permit), consulting, and booking. Through portals like www.togo.tg and www.service-public.gov.tg, which provide links to most of the public institutions and offer information on all basic public services, the government aims at achieving a seamless stage in terms of e-government development.

Edmiston (2003) informs that e-government has the potential to enhance the efficiency of the public sector and to allow more personal,

customized relationships between citizenry and their public service providers. And the importance of web technologies in public management can be categorized into two: internal, as effective and efficient managerial tool, and external, as facilitating government's linkages with citizens (Moon 2002). However certain challenges limit its full implementation. Given a reluctance to change in human enterprises, Edmiston (2003) affirms that the transition to e-governance requires strong leadership for a successful implementation. In the adoption of e-government, problems arising from the resistance to change are the most perplex (UN/ASPA 2002). Layne and Lee (2001) note that e-government implementation requires that infrastructures must be built. Makoza (2013) for his part links the situation to not only the lack of infrastructure, human resources, and skills to effectively implement e-government projects but also to the challenges of digital divide where there are unequal access to ICT. The UN/ASPA (2002) cite costs, lack of resources to support the operations, organizational and cultural dichotomies, lack of capacity to manage large-scale IT projects, resistance by leadership, lack of coordination, information mismanagement, and absence of policy guidelines as some of the barriers to a successful implementation of e-government.

## Conclusion

This case study provides an evaluation of public institution websites in Togo. Achieving a high level of e-government development calls for an effective online presence of public services. While some institutions are yet to have a web presence, certainly due to not only the cost associated with website development and maintenance but also the existence of certain resistance and reluctance to change, those with online presence are yet to be fully functional with interaction and transaction possibilities. Based on the findings, there is still enough room for improvement for e-government development in Togo. However generalizing such findings require some level of cautiousness as not all existing state institutions were covered in the study.

# Network Governance in Local Economic Development in South Africa

Mapule Mirriam Gugu Mashiteng[1], Cecile N. Gerwel-Proches[1] and Nikita Singh[2]
[1]Graduate School of Business & Leadership, University of KwaZulu-Natal, Durban, South Africa
[2]Rhodes University Business School, Rhodes University, Makhanda, South Africa

## Synonyms

Collaborative networks; Local economy; Public administration

## Definition

Network governance in local economic development refers to the informal or organic coordination of multiple social systems in the promotion of the development of local economies and/or communities.

## Introduction

Partnerships or collaborations are critical drivers in local economic development (LED) in South Africa, especially at the level of its local government and related municipalities. In terms of policy, LED planning should be synchronized in a way that involves provinces, districts, and local municipalities. The main challenge, however, is how to put this into practice, considering that one of the identified problems among such departments in South Africa is their tendency to operate in silos, rather than collaboratively. LED strategies in South Africa need to reflect the country's integrated development plans (IDP) and thus require a concerted effort by all parties who play a role in developing LED strategies. The "local" part of LED should not be taken to only mean local in a literal sense, as in most cases LED strategies encompass district, provincial, national, and even the global economy. Thus, in order to drive the local economy, the different stakeholders should have meaningful and symbiotic relationships.

Networks play a crucial role in LED in South Africa as they shape the nature of the implementation mechanism. Governmental stakeholders are becoming increasingly dependent on not only one another but also on nongovernmental stakeholders to ensure effective and informed policy design and implementation. In South Africa, the large metros tend to have the advantage of networks given the size of their private sectors, while in smaller municipalities (where there sometimes is only one dominant company or business), LED network effectiveness wanes (Wallis and Reddy 2012). Networks also make it possible to improve the existing interactions between the public and private sectors and facilitate the local authority taking charge of LED implementation in the country. This is especially relevant to the South African context as historically local municipalities have been unable to effectively drive LED alone (Khumalo et al. 2019) and thus desperately require the support of networks of actors and institutions to assist in this endeavor.

LED networks have been used in different ways to harness the synergies and competencies of different stakeholders. For example, the Cape Town Partnership was established in South Africa in July 1999 as a Local Economic Development Agency (LEDA) involving numerous other stakeholders from the city including residents, government actors, businesses, and NGOs. Adapting such a model would require a concerted effort by municipalities, as they would need to spend time and money to make such LED network governance functional.

## Network Governance in Public Policy and Public Administration

The presence of the multiplicity of stakeholders, actors, institutions, and agencies (both governmental and nongovernmental) has organically given rise to networks in the LED environment.

Effective LED implementation requires the effective and efficient functioning of all actors, as well as the networks created by such actors. This speaks to the idea of network governance as encompassed within the auspices of current public management and public administrative theory.

Network governance pertains to the idea of an informal arrangement of actors, partnerships, institutions, agencies, and/or any other stakeholders who operate organically toward attaining shared goals. No one entity is "in charge" – thus, power is distributed throughout the network. One could use the metaphor of muscle fibers that intertwine to form the biological structure of a muscle which facilitates movement. In this example, it is not a single muscle fiber that brings about movement but rather all such fibers working together. Similarly, the "movement" of network governance is facilitated by the synergistic actions of all the actors involved in a particular network. Within the context of public policy, one can view network governance as the way in which private and public actors at differing government levels coordinate their interdependencies in a self-regulatory fashion to enact certain public policies and/or provide certain services to the public. Hence, the focus moves away from emphasis on a sole public actor, by drawing attention to public policy creation and enactment via a network or web of actors (private, public, and civil society), thus heralding a network perspective of public policy (Klijn et al. 2010). Such "actors" refer to entities such as organizations, groups, institutions, and individuals with the networks they form, providing direction and coherence in an organic manner. The "organic manner" in which the networks operate speaks mainly to the idea of the relationships (and actors which comprise such networks) as operating within a usually self-governing or self-regulating framework for decision-making for some public purpose (Lewis 2011). The governance aspect of the concept refers to the way the network is structured and organized, how it regulates itself and engages in decision-making, how it meets the goals of network actors and managers, and how it fulfills their established norms (Wegner et al. 2019).

These descriptions of network governance provide some idea as to what the concept signifies, especially within the context of contemporary public policy. However, even though the concept of network governance has received much attention over the last 20 years, there still exist many ambiguities and confusion in fully comprehending the concept, thus hampering the development of a universal definition of it. However, like all other social and organizational phenomena, the idea of network governance introduces many merits and challenges for the actors involved.

## Merits of Network Governance for Public Policy and Development

According to Klijn et al. (2010), network governance (and the management thereof) is fast becoming recognized as an important consideration when aiming to foster healthy and effective network relationships and bring about overall success in the contexts in which they are embedded. Network governance in public policy has heralded an approach to governance in which control, management, and the power of a network rest with the actors themselves (and the interactions between them), thus moving away from the common idea of governance as being directed from the top-down via bureaucratic structures, as espoused by Weber.

Lubell and Fulton (2008) also support the notion of network governance as having merit in the management and implementation of public policy. They argue that the strength of network governance is brought about by the very networks themselves, as such networks (1) facilitate the diffusion of policy and management innovations, (2) foster the growth and development of social capital, and (3) facilitate social learning which ultimately encourages the development of channels for more effective cultural learning. Since the diffusion of policy and management innovations, the creation of social capital, and the encouragement of social and cultural learning are difficult to achieve, especially in complex multi-actor settings, network governance and its proclivity to bring about all three of these objectives can be especially beneficial in public policy settings hoping to achieve the same.

Structurally, the merits of the concept of a network lies in the fact that usually such networks consist of a large number of complex interconnections; the larger the system, the more complex such networks and interconnections will be. This could be one of the reasons for the benefits of network governance as identified by Lubell and Fulton (2008) as innovation, the growth of social capital, and social learning can only happen in dense networks that are open to each other and which communicate continuously. When this happens, the lines or boundaries between actors and/or entities that comprise such networks become blurred, thus allowing political, administrative, and ideological boundaries to be crossed, hence fostering trust, collaboration, communication, knowledge sharing, and the building of shared norms. However, this will ultimately depend on the strength of the relationships between actors and entities as the presence of multiple relationships does not presuppose strong, effective networks.

Hassall (2009) in his lectures on theories of governance proposed that network governance has many advantages when applied to public policy settings. Firstly, since such networks are informal and loosely structured, it is possible to involve actors who may have the necessary technical expertise, but who are not state actors, to assist with the enactment or construction of public policy. This is usually restricted when dealing with bureaucratic approaches to public policy as often in these cases it is mainly state actors and institutions that are called upon to construct and enact policy. Secondly, networks can be made up of actors and entities from the public, private, and civil society sectors. This means that resources, knowledge, and expertise from a broad range of fields and which cross diverse geographical boundaries can be pooled together due to the networks that are established, thus heightening the possibility of innovation – a harbinger of good policy development and implementation. Thirdly, such networks can be formed and dismantled fairly quickly and efficiently due to their informal nature and thus offer a more rapid and efficient response to specific problems, as compared to conventional bureaucratic administrative arrangements. Finally, network governance is especially suited to the area of public policy and public administration due to its emphasis on allowing the fluid coming together of public, private, and civil society actors to facilitate the successful completion of complex public policy projects while still encouraging public accountability.

## Network Governance Challenges

In bringing together all these actors within such networks, it is logical to assume that such would present many challenges. The management of network governance takes center stage in this regard with the belief that if such networks are not managed well, they cannot produce much of the benefits that were explored earlier. In addition, while much research exemplifies the merits of network governance, especially in public policy settings, the management and interaction of such a multiplicity of actors and networks does not always lead to positive governance outcomes. This dynamic, especially in public policy implementation, development initiatives, and problem-solving, is in its very essence a complex process which does not progress in a linear fashion. If the networks get larger and more complex over time (by drawing more and more actors and institutions into policy formulation and implementation), communication breakdowns can lead to network breakdowns (Hassall 2009). Even in their attempts to decentralize control and power in public policy, it is possible for such efforts to reinforce centralizing tendencies.

The propensity for network governance to spiral out of control and produce negative consequences is tied to the fact that they are informal networks and may thus be loosely supervised by state or public actors; thus, they may progress in a direction that could be counter to what was envisioned when such state actors established such networks in the first place. In addition, such networks can grow rapidly and encompass a myriad of actors and institutions and the relationships between them. Thus, it can be quite challenging for the government to then control, manage, and oversee such a complex entity, as well as to ensure that they effectively contribute to LED in the country.

Furthermore, it is possible and common for such networks to involve many different actors and institutions from multiple settings and contexts, with varying levels and types of expertise, from vast geographical territories, and with different ways of communicating and working toward common goal(s). The complication here arises in clearly articulating goals and expected policy outcomes as every network stakeholder will perceive the attainment of their (or their organizations') goals as the most important. This could ultimately be to the detriment of the collective plan of the network, as envisioned at the outset of the network's formation. Also, the resultant collective outcomes of the network are influenced by each and every member of the network. Thus, poor performance on the part of one or a few network members can cascade throughout the network and impede the performance of all others, ultimately affecting the attainment of the shared goals of the network. For this reason, accountability becomes an important issue in steering the network in a positive direction, especially since they are not usually governed by a single controlling authority – thus, accountability needs to rest with each and every member, without which network goals cannot be effectively attained (Hassall 2009).

Thus, network governance can be afflicted by many challenges especially since it is rooted in a phenomenon that by its very nature involves several different groups of actors and institutions at varying levels of public, private, and social existence operating in ever-changing and turbulent environments. However, at the very core of the issue is the fact that what ultimately makes them effective remains unclear. This also varies depending on the context in which network governance occurs. In the context of LED in municipalities in South Africa, several role players are key in the creation, maintenance, and effectiveness of such networks.

## Key Role Players in LED Networks in South African Municipalities

The LED concept revolves around three major players: local government, the community, and the private sector (Gerwel Proches et al. 2012), as well as role players unique to the South African context, such as the Department of Cooperative Governance and Traditional Affairs (COGTA). Some of the key functions performed by COGTA include providing guidance, direction, and leadership in the creation of policies, which assists in bringing efficiencies to doing business. COGTA is a significant player in LED in South Africa by playing a critical role in administrating policies, programs, and projects to ensure development and growth in the country. A final role played by COGTA involves the initiation of economic development programs, which is done by availing funds, establishing regulations, and promoting small and medium enterprise development, social enterprises, and cooperatives.

Another key section responsible for providing support for LED in South Africa is the chief directorate under the Department of Provincial and Local Government (DPLG). This is usually done through several programs, including developing and reviewing national policies on LED-related initiatives. Their mandate extends to the provision of all types of support for capacity building for provincial and local government. The directorate is also responsible for managing the LED Fund, which deals with the processing of budgets for LED programs.

Besides the chief directorate and COGTA, another key role player is the Department of Trade and Industry (DTI). The key role of DTI is, as per the mandate of the department, the promotion of economic growth and the creation of employment opportunities. In this regard, the DTI finds support in the South African LED National Policy Framework. That the DTI is a port of call for most budding entrepreneurs is no coincidence, as the mandate of the department is in line with the LED policy framework.

LED role players at the local government level include a wider range of stakeholders, including the district municipalities, metropolitan areas, local municipalities, private stakeholders, and community organizations. This group of stakeholders must collaborate with the business sector, labor, and civil society organizations, with the objective of improving outcomes under the LED initiatives. Different types of public private partnerships often emerge from this which can be used

to effectively operationalize LED, and each local municipality develops a unique LED strategy which becomes a guide over a period of time for the implementation of LED. One of the key issues that can unravel a LED initiative is a lack of partnerships. Most LED strategies, and even government departments, recognize the importance of strategic collaborative partnerships at the local, provincial, regional, and even national levels for the support and promotion of LED initiatives.

### The LED Policy Framework in South Africa

South Africa's 1994 democratic breakthrough introduced new thinking in government, which became more focused on the urgent need to have more pro-poor elements in all programs of the government. The African National Congress (ANC), which was the leading political party of the then democratic South African government, introduced the Reconstruction and Development Programme (RDP) as a way of addressing the challenges facing previously disadvantaged populations. The RDP laid the foundation for a LED focus in government in general and has since been a basis upon which LED policies in South Africa have been developed, shaped, and improved. However, a number of other policy documents and legislation were also introduced that sought to support the role of LED in the local space. These policy documents and legislation included the following:

- Constitution of the Republic of South Africa (1996)
- The White Paper on Local Government (1998)
- Municipal Systems Act of 2000
- Growth, Employment and Redistribution Strategy of 1996

A central theme that runs through all the policy documents governing LED implementation is the importance of the service delivery triangle. This implies a shared understanding that for LED to work, it requires cooperation and partnerships between primarily the government, the private sector, and local communities. A dysfunctional service delivery triangle has been seen as one of the key challenges leading to nonperformance or the poor performance of LED initiatives in the country.

The Constitution of South Africa provides a foundation for a developmental local government and recognizes the importance of service delivery in which LED plays a pivotal role. Sections 152 and 153 of the Constitution of the Republic of South Africa in particular state that municipalities must provide and manage their administration, budgeting, and planning processes in order to ensure that the basic needs of communities are given priority (Act No. 108 of 1996). Besides this direct mandate, the Constitution also mandates local government to provide democratic and accountable government for all communities, ensure service provision in a sustainable way, promote social and economic development, promote a safe and healthy environment, and encourage community participation and involvement in matters of the locality.

Drawing from the Constitution, the government also used the White Paper on Local Government to formally introduce and implement developmental local government. This is a concept whereby citizens drawn from a community are involved in local government issues as a means to ensure sustainable ways to address social, economic, and material needs and improve living standards. The thrust of developmental local government is not so much to create direct jobs but dwells more on the creation of a conducive environment for investment and business opportunities. The White Paper found support in government's 2005 "Policy Guidelines for Implementing Local Economic Development in South Africa," which identified the need for a healthy environment for business and dealt with the challenges of poverty, inequality, and the lack of employment in the country. While municipalities cannot be responsible for creating employment, the policy document recognizes the

strategic role that these institutions play in creating an environment that stimulates business.

## LED in Local Economies in South Africa

The South African government realized the challenges arising from several years of skewed development and adopted LED as their policy of choice to address such inequality because it was recognized that local government, as the sphere (or tier) of government that the people are closest to, is best placed to maximize the potential for developmental support that exists in a locality. Appropriate effort is required to channel the right amount and type of investments into a locality so as to create much needed jobs and increase the desire for goods and services in such an area. To this end, the South African government's developmental agenda puts municipalities at the center of the social and economic development of their communities. This was formalized through the setting up of LED departments at various levels of the three spheres of governance. Economic development has therefore become an intrinsic part of all South African municipal councils' development agendas.

LED is considered an important means of reaching out to local economies in the country. The main aim of LED is to facilitate job creation by fostering local economic growth in a locality, creating more businesses and production lines in municipal areas, funding growth initiatives, and providing a conducive environment for economies to improve. The IDP process is a key part of the government's LED program, in which key municipal stakeholders engage in robust discussions and decision-making to guide the local economy to grow and to facilitate job creation for more people, especially the impoverished. National government's role in LED is in policymaking, funding, research, and other forms of support. Through the local municipalities, LED is thus meant to be a speedy localized response to the social and economic challenges facing localities. Capacity issues matter most in LED as the process is driven by several actors, yet the local municipalities are central to this process, such that without the appropriate "drivers," the LED process may be futile.

## Intergovernmental Involvement in LED in South Africa

The involvement of stakeholders, in both the public and private sectors, is crucial to the success of LED, especially in local and rural municipalities. Different government units and departments have responsibilities for the implementation of effective LED programs, such as the provincial departments of COGTA and the Departments of Economic Development and Tourism (DEDT) – however, they do not always play a meaningful role nor do they support local municipalities to the extent sometimes envisioned by the municipalities. This is a common point of contention in many municipalities in South Africa. On the other hand, it has also been found that local municipalities are not always open to collaborations with provincial government departments and neighboring district municipalities. This then provides the space for private stakeholders to take more initiative in driving LED programs on their own, without any active or visible involvement from the municipality. This sometimes affects the LED trajectory of local and rural municipalities, with the private sector driving them in a particular direction and the municipality pulling them in another.

South African local government also tends to experience contentious relationships between its rural and local municipalities and their neighboring district municipalities. While this indicates a structural challenge in the way LED is managed, the fallout between these two state institutions is not good for LED. The partnership between local and district municipalities should be symbiotic, which currently is not the case in South Africa. LED requires a holistic and integrated approach because LED has to deal with economic, social, welfare, and political issues simultaneously. Particular attention needs to be given to develop skills transfers and expertise to ensure efficient and effective human resources. COGTA must also play an active role to bring all the LED initiatives as well as the relevant stakeholders together beyond simply requesting reports from the municipality. Financial resources are a key requirement for all municipalities, and this should be sufficiently provided by national and provincial

governments. Tedious and lengthy administrative procedures (which South African public administration is famed for), which tend to delay implementation, must also be avoided.

Local and rural municipalities in South Africa experience several implementation challenges such as silo mentalities in planning, parallel planning, duplication of efforts, competition, and a lack of consolidated reports, which have found to stem from their inability to create effective and sustainable partnerships with other LED government stakeholders. Thus, implementation is affected by the lack of coordination in LED by different governmental departments across policy levels. The dependency of LED on the other five key performance areas (KPAs) of local government was emphasized by Hildreth and Bailey (2014) who opined that LED cannot be executed in a vacuum; hence, an integrated approach is required from planning to implementation. LED remains a pertinent issue on the South African development agenda. The South African government has convened a national dialogue on LED for further engagement and debate on the subject, while the Mpumalanga provincial government also put the subject of LED on the agenda of its executive council as a matter for discussion. This has signaled a serious need for better collaboration between the various governmental actors on the subject of LED in South Africa.

### Private Sector Involvement

With regard to private sector actors, non-government headed LED is widespread, with the private sector taking the lead as the main drivers. However, there tend to be concerns regarding the abuse of power and the undermining of the authority of municipalities by businesses, especially in small, rural, and local municipalities. This leads to situations in which local government is not open enough with the business community and there is no trust between them, with local government turning to business and private actors only when there are major issues and challenges that they cannot confront alone. From this, it is evident that more meaningful partnerships need to be created with the private sector, and the private sector should be engaged regularly to build more effective relationships, with municipal leaders driving such engagements.

Although local municipalities partner with various stakeholders in driving LED initiatives as mentioned earlier, they tend to operate in silos without involving other stakeholders in effective networks that produce results for the communities in which they are embedded. They do not always engage private partnerships in such a way so as to attract sufficient investment and resources to their municipalities. However, it must also be noted that South African public administration and management is characterized by much "red tape" and long turnaround times which inadvertently causes the private sector to prefer to proceed at their own, often faster pace, without the municipality's and government's involvement.

LED units within the municipalities mainly engage with stakeholders through the Municipalities Economic Development Partnership (MEDP) meetings. This is another source of contention as it is often the case that the LED units do not participate in the IDP process (or development plans) of their own municipalities, nor do they participate in district convened sessions of a similar nature. This gives the perception that municipalities prioritize other matters over LED. Thus, it is not only the lack of support from other LED stakeholders that is problematic but also the lack of alignment in the municipality's interests regarding LED. Mutually beneficial relationships are needed with business institutions; however, the reality is that municipalities only engage the private sector when they are looking for donations or support that favors their operations or needs at a particular point in time. This is a pity as the private sector has the skills, expertise, time, and resources to ensure profitability and success in government projects and programs and to ensure positive deliverables to communities and municipalities.

It seems that the implementation of LED programs will remain constrained as long as municipalities do not partner more efficiently and effectively with their private counterparts. There are many LED projects that are being spearheaded by the private sector which are not in partnership with the municipality due to such challenges. This is very unfortunate as municipalities should be an

integral nexus for encouraging multi-stakeholder partnerships in order to pool resources and attract investment to communities in desperate need of such. Furthermore, local and rural municipalities should not get left behind or sidelined by the private sector and should be responsive to the issues raised by the private sector in order to encourage private participation and networks. The most cited form of support required by the municipality from stakeholders is funding and investment, while input from stakeholders during the consultation process is important for better planning and integrated development. A business-oriented culture and work ethic must be adopted and instilled in the operation of municipalities, and business intelligence and advice can also improve the LED functionality in the municipalities. Finally, there should be joint implementation of LED projects, as well as shared proceeds and acknowledgement for mutual projects.

Resources, such as project champions, do not form part of the daily human resource requirements of municipalities in South Africa, even though they are critical to LED project success. According to Meyer (2013), without LED champions, most LED long-term programs will falter, because politicians tend to be in control of council budgets, and without political support, noble projects may be watered down and shelved year after year. This problem is related to what Koma (2014) identified as a bias toward "quick-win" projects versus long-term projects. Quick wins are similar to a "pro-poor" emphasis of LED, whereby the municipality wants to be seen to be doing something in the shortest possible time at the expense of the impact of the project. An emphasis on quick-win projects in South Africa has been traced to politicians pushing for projects so that they can amass votes in upcoming elections.

The resource challenges noted transcend beyond physical and monetary issues to indicate a shortage of capacity building resources and a need for more robust LED networks with the private sector. Stakeholder involvement is crucial for the effective application of any development program. Local municipalities in South Africa desperately require the effective involvement of governmental and nongovernmental stakeholders in their LED implementation programs, from the planning to the implementation and reporting phases. The establishment of sound and mutually beneficial LED networks plays a crucial role in LED implementation, as they inform the nature of the implementation mechanism. Strengthened relations must be established between the municipality, neighboring municipalities, and the Provincial Departments of COGTA and Economic Development and Tourism. Private sector involvement should also be enhanced, and support for the success of Municipalities Economic Development Partnerships must be mobilized and unreservedly given by the political leadership of the municipality.

## Bringing It All Together: The Implications for Network Governance

The involvement of stakeholders, in both the public and private sectors, is significant to the success of LED in municipalities in South Africa. Different government units and departments have responsibilities for the implementation of effective LED programs; however, the provincial departments of COGTA and DEDT tend to not play a meaningful role nor support municipalities to the extent expected. In addition, the municipalities themselves are perceived to not be open to collaborations with provincial government departments and their district municipalities; thus, private stakeholders tend to drive LED programs on their own, without any active or visible involvement from municipalities.

Thus, it appears as if network governance is not effectively manifesting in these municipalities as most of them do not display the propensity to form effective networks and furthermore lack the capacity to maintain and manage the few networks that they do possess. This emphasizes the significance of the management of networks, without which such networks will not be able to achieve their intended outcomes. It is evident that many municipalities in South Africa require more management assistance and one cannot say exactly where such guidance should come from, as networks by their nature should facilitate democratic decision-making. This will have to be considered when deciding who should manage such

networks in local municipalities and LED initiatives, so that it is not seen as a decision forced upon them from the top down as in conventional bureaucratic operations.

In addition, the different units within the municipalities operate in silos, which further makes the measurement of outcomes difficult. There is often parallel planning and implementation, which leads to duplication and competition within the same space, thus highlighting the importance of the management of such networks to ensure network success (Klijn et al. 2010). The danger is that if left unmanaged, network governance can prove to be largely ineffective. Thus, seeing network governance as being an organic process in which network members self-manage is largely unrealistic as such networks require some level of management. Furthermore, the outcomes of the network will be greatly influenced by the ability and competence of the network manager(s) and the manner in which they are able to manage intricate governance processes (Edelenbos and Klijn 2006; Agranoff 2007), as well as by their ability to identify and connect critical network actors. Effective network management is a difficult task as it requires much effort to satisfy all network actors, actors who can become unamenable if they perceive their goals to not be satisfied, thus discouraging network managers, who may then lessen their efforts, leading the network to decline into chaos and inefficiency (Klijn and Koppenjan 2012, 2016). This speaks again to the dilemma of introducing management elements into the notion of network governance in public policy as it presents itself to be inherently complex, ever-changing, and self-regulatory in essence.

Some municipalities do not want to subject themselves to their district municipality's reporting requirements and do not even submit reports for inclusion in district-wide LED performance reports. This speaks to the inherent tension between network governance and top-down approaches to governance and to the confusion of stakeholders who are exposed to both, as this instance clearly shows that stakeholders in municipalities cannot navigate the transitions from being accountable to a single authority (as is the case with their district municipality) to being accountable to other network actors. In addition, this brings to the forefront another dilemma – that of the difficulty in measuring the outcomes and effectiveness of network governance efforts. This is particularly important as network actors run the risk of focusing all their efforts on outcomes that will reap the most rewards for themselves, to the detriment of the network as a whole. In addition, apprehension in reporting to its network members could reveal an attempt to hide a lack of contributions to the overall goals of the LED network.

Often it is reported that municipalities in South Africa give too much attention to small-scale projects which do not contribute to LED or are too haphazard, lacking clear direction and focus. This shows that there is not much communication happening between network members as to what projects to prioritize and how to coordinate all LED projects so that they can flow seamlessly without disrupting one another. This could be because certain network actors do not feel that they possess the power to organize and prioritize particular network goals and projects, thus bringing into consideration the distribution of power within such networks. As Kenis and Provan (2009) assert, such power imbalances are common among networks utilizing lead organizations to direct the networks overall operations, while Hermansson (2016) argued that it is the extent to which network members can access and utilize critical resources that will enable them to counter such power imbalances.

Thus, networks alone do not guarantee effective LED project outcomes. Effective network governance requires structures that encourage coordination of network members, agreement among members over shared goals and plans of action, and consensus on, and concerted effort toward, attaining specific goals that address the overall purpose of the governance system. To counter the lack of network coordination in LED implementation in municipalities, viable and inclusive LED forums should be established. In addition, the private sector should be engaged regularly to build relationships and foster networks, the municipalities must get buy-in to encourage

effective collaboration, and municipal leaders should effectively drive such engagements.

Another important point is that it is not only about government spheres providing support to the local municipalities but also equally important is that the municipalities should accept the available support. When network members do not align their operations and goals and, furthermore, restrict communication to silos, effective synchronization between the various actors and institutions in the creation and application of LED in the municipalities is severely hampered. In such a scenario, each actor will operate for their own benefit due to dissatisfaction with the other network members, to the detriment of the network as a whole. This is supported by the assertion of Lewis (2011) who found that if the network actors do not develop a microculture of shared understandings, they are more likely to contest one another than cooperate. In these circumstances, shared goals, network efficiency, and efficient communication cannot be attained. Furthermore, there need to be certain "bare minimums" already in existence in the context in which such networks are embedded, to ensure network governance effectiveness. Whetsell et al. (2020) point to a history of cooperative activity and the existence of sufficiently developed networks as some instances of such bare minimums while also asserting that implementation of such networks in traditionally hierarchical settings will prove to be problematic. In the South African context, network governance in LED in rural and local municipalities has to contend with many challenges such as the lack of proper capacity in communities, corruption among network members and within the municipalities themselves, and infrastructural deficits, to name a few.

There are many municipalities in South Africa, and while some do give continuous support to LED projects, even after the active funding and implementation phases have ended (thus ensuring that such projects remain sustainable), other municipalities do not do enough to ensure the sustainability of LED initiatives. Thus, network governance is not a black or white phenomenon, as it is possible for networks to fluctuate between producing both positive and negative outcomes. This is logical given the fact that such networks are made up of a complexity of actors and interactions embedded in an ever-changing and turbulent public policy landscape. Berthod et al. (2017) suggest that networks require a switching between governance modes to deal with such fluctuations, with more assertive and hierarchical governance modes required in times of crisis or network tension. Clearly then this presents further implications for the development, management, and governance of such networks.

## Conclusion

Sustainability requires more than simply funding or a well-developed plan. Sustainable LED in South African municipalities is a collective effort between government, businesses, and the community. For local economies that are economically challenged, the piecemeal realization of LED is ineffective. LED should be planned and enacted by a wide range of actors from multiple sectors, because if successfully implemented, it will have an effect on all sectors of society. However, the presence of network governance does not automatically imply LED project success because there are many factors within the auspices of network governance that need to be properly developed, managed, and assessed, to ensure positive network outcomes for all actors involved. Therefore, while it may not be a panacea for all public policy and administration ills, it has much to offer in the area of LED, especially in rural and local municipalities in South Africa, with the main caveat being that such networks need to be managed in a way that encourages from all actors whole-hearted accountability, open communication, and the collective pursuit of network goals.

## Introduction

Research on networks has gained popularity among scholars of public administration since the 1990s, when early work on networks appeared in the literature (Berry et al. 2004; Milward 1996). Most scholars contend that networks are useful and effective tools for governance that substitute for bureaucratic structure, while some argue that networks can possess dark sides when they are used for criminal or immoral purposes (Agranoff and McGuire 2003; Raab and Milward 2003). Regardless of the intention for using networks, the general assumption is that networks are key to explaining how participants from different sectors (e.g., government, private, and nonprofit organizations) involved in public policy or service delivery work together to achieve a common goal not attainable by a single actor.

In the recent public administration literature, scholars often identify the major streams of network research as follows: policy formation, governance, and policy implementation. This taxonomy is based on the work of Lecy et al. (2014). More recent studies, arguing that extant research conceptualized and measured relationships in networks based on the premise that the nodes and ties in networks lie on a single-level structure, contend that networks are inevitably multilevel and multidimensional structures (Henttonen et al. 2016; Hooghe and Marks 2003).

### Policy Formation Networks

Policy formation network research focuses on how various actors, through horizontal cooperation, form coalitions or interest groups to address the perceived failures of state authorities and solve social problems as well as framing these problems as new agendas (Marsh and Rhodes 1992; Rhodes 1990). Consequently, this approach assumes that policy formation is a result of non-hierarchical and self-organizing cooperation among the network actors and contends that networks provide ways for actors (e.g., nonprofit organization, private companies, interest groups) to influence policy makers (Weible 2005). However, some may argue that the non-hierarchical cooperation in networks is not equivalent to the absence of hierarchy in network structures. In policy formation networks, different levels of government (e.g., central, federal, state, local) exist as actors, and they reflect the legally mandated vertical (formal) structure. Therefore, from a statutory perspective, other parties, such as citizen interest groups, private organizations, and associations, are not legally mandated to form network structures and can be categorized as non-government organizations. While a policy formation network may seem to be a non-hierarchical cooperation structure, in practice, governments are hierarchical organizations; thus, a vertical network structure is already in place before other actors begin to participate in the network. Therefore, non-hierarchical cooperation may be valid in single actor-to-actor relationships but not in networks where multiple levels of governments are involved.

### Policy Governance Networks

Governance networks, composed of actors engaged in collaborative relationships, exist to solve complex policy problems that cannot be addressed by a single actor; thus, actors in governance networks tend to rely on each other and to accept the assumption of the interdependence of actors (van Bueren et al. 2003). Although these networks solve public or policy problems, because they are not legal entities, some form of governance is required to maintain the collective and mutually supportive interaction, resolve conflicts among actors, and effectively acquire and utilize resources (Feiock and Scholz 2010). The notion of games is a crucial factor in governance networks where mutually dependent actors form networks around policy problems. Because a network and its actors have limited formal authority and accountability to network goals, conformity to the rules of the game tends to be voluntary.

The network actors seek to participate in the games by interacting with all types of actors in various levels to fulfill their purposes, and those activities inevitably lead to multilevel structure networks. For example, in the United States, federal, state, and local governments work collaboratively in areas such as environmental management and the federal government, represented by the Environmental Protection Agency (EPA), which directly provides federal grants to local watershed organizations without going through the states. For another example, many private actors in Europe bypass the hierarchical structure of the national government by interacting directly with the supranational level government (EU: European Union) rather than pursuing their interests in a stepwise manner (e.g., from national to the EU level).

Because varying levels of governments are organized vertically, despite the capacity of private or nonprofit actors to interact with any level of government, the structure of governance networks will become multilevel. The consensus among scholars studying governance networks is that networks were founded as a solution to the problems of market-based approaches in the new public management (NPM) or managing the "hollow state" (Milward and Provan 2003). Thus, it is

clear that networks as a structure came after the traditional bureaucracy. In other words, the structure of bureaucracy by levels of government precedes other actors that have been introduced after the evolution of networks. In this sense, the hierarchical structure by levels of government can be considered as a type of fixed multilevel structure that expands its boundaries by adding other actors to construct a governance network. Consequently, a governance network is a multilevel structure originated from traditional bureaucracy.

### Policy Implementation Networks

Policy implementation, or the public management network, functions as a coordination mechanism for effective public service delivery (Hjern and Hull 1982; Provan and Milward 2001). This research stream originated from scholars who viewed networking as a way to deliver intergovernmental programs effectively. Most research following the policy implementation stream has not turned its attention to the presence of multilevel structure of networks. To illustrate this example, the study by Milward and Provan (2003, p. 5) is used. The authors state that mental health service is a policy "governed by federal and state regulation; funded by the federal, state, and county governments; and implemented by states, local governments, nonprofits, and private firms." Based on the authors' statement, the providers of mental health services would receive funding from multiple levels of governments that have their own set of regulations and requirements for determining the funding for the providers. Accordingly, interaction among governments and providers will occur not only via a single-level structure network but also in a multilevel structure where governments form hierarchy by level and interact with the providers. The implementation network structure becomes multilayered because bureaucracy is one form of vertical structure and the public service delivery network evolved out of bureaucracy-based intergovernmental relationships. Therefore, unless there is evidence that networks are constructed by abolishing the vertical structure of government by levels, the structure of networks is multilevel.

## Multilevel Multidimensional Network Model

The purpose of introducing this model is to show that networks are not single-level horizontal structures but are multilayered and multidimensional structures. A typical network structure plot in the current literature involves connected nodes (actors) and ties (linkages or edges).

As represented in Fig. 1, the linkages are connected based on a single-level structure, meaning that the nodes are treated as lying on the same hierarchical level of the network structure without accounting for the multiple levels in which each actor is placed. In essence, a single-level structure assumes that networks are two dimensional. However, in MLMD, networks comprise a multilevel and multidimensional structure in which actors in different layers of hierarchy are vertically distinct from each other, and actors in different sectors are connected by inter-sector relationships. Figure 2 offers a graphical representation of the MLMD.

### Classification of Actors in MLMD

An actor (node) in networks is the most basic unit for analysis, and the node can be either an individual or an organization. The network composed

**Network Structures, Fig. 1** Example of a single-level structure network

N

**Network Structures, Fig. 2** Conceptual map of multi-level and multi-dimensional (MLMD) network model

of these actors can be defined as a group of autonomous actors with independently determined goals that come together to produce a collective output that no single actor can achieve on its own (Isett et al. 2011, i161). In networks related to public policy or management issues, examples of popular actors are governments, nonprofit organizations, private organizations (businesses), and interest groups. In the MLMD model, actors in networks are classified into two sectors: government and non-government sectors. Governments are network actors established based on legal mandates (e.g., constitution, state law) as an executive branch. Non-government actors are all other actors, excluding the governments. These non-government actors may be of diverse form, such as nonprofits, private companies, joint venture corporations, associations, and interest group organizations.

## Multilevel Structure in MLMD

The multilevel structure of a network in MLMD encompasses two groups of actors: government and non-government organizations. First, for the government actors, federal (central), state (provincial), and local government are not homogenous entities; they have different legal mandates, discretions, expected roles, and uphold different norms and values. Therefore, despite the fact that governments may cooperate to achieve common policy objectives, their legal boundaries, represented by levels of government, distinguish them from each other. Governments at different levels are inherently heterogeneous, while the governments at the same level are nested within networks where they confront homogeneous patterns of intergovernmental relations with higher or lower level governments. Such distinctions of levels of governments (e.g., national, federal, state, local) have been well explained in the previous literature regarding intergovernmental relations (IGR).

It is widely accepted that the relationship among governments at different levels is vertical, while the relationship among governments at the same levels is horizontal. For instance, the government structure of the United States involves three levels of government: federal, state, and local. As seen in Fig. 2, the governments in these three levels can be aligned vertically, from

the federal government at the highest level to the local government at the lowest level. The three levels mirror three separate layers composed of government actors. Because there is only one federal (united) government, the top level will involve only one actor. For state and local level governments, multiple actors within the same level will interact with each other in a horizontal manner.

Next, non-government organizations can be organized vertically as well (Fig. 2). Private firms, nonprofit organizations, and interest groups, to name a few, often construct their organization in the form of hierarchy in order to maximize their operational efficiency or fulfill their organizational goals (e.g., profit generation, fundraising, service provision). These non-governmental actors can structure their hierarchy in numerous ways. For example, private organizations and interest groups are organized by hierarchy that is considered to be an element of the formal structure of private organizations. In addition, nonprofit organizations sometimes take a business franchise approach, conduct vertical integration similar to for-profit firms, and resemble the form of professionalized bureaucracy similar to that of government organizations. These non-government entities (private organizations) often form strategic alliances or networks to interact with each other for reasons that include reducing cost, developing new technologies, exchanging information, etc. To show the multidimensional structure of the network, in which government and non-government actors interact with each other, not only at the same level but also over different hierarchical levels, the MLMD model assumes that the non-government actors are organized vertically in three levels. In practice, the non-government actors reserve the right to freely structure their organization and that there is no legal mandate as to how many hierarchical layers a non-government organization should have, so the number of layers may be smaller or larger than three.

## Multidimensional Structure of the Network

The interaction among actors in government and non-government sectors and their inter-level network relationships characterize the multidimensional structure of the network. Inter-sector, inter-level, and within-level relationships are explained, respectively.

### Inter-sector Relationships in MLMD

First, inter-sector relationships occur whenever actors from different sectors engage in a network relationship. Government and non-government actors interact with each other across sectors based on their reciprocal needs in the policy process. In other words, accepting that the network is a broader structure than intergovernmental relationships involving only governments, the addition of actors from the non-government sector makes the relationship dynamics intersectoral. A popular form of this type of relationship includes government and nonprofit information and service networks, regulatory networks of government and private actors (e.g., firms, experts, regulatee), networks between lobbying groups and governments, or sometimes a mixture of various levels of government, private, and nonprofit actors in public service provision. These examples of intersector relationship involve both horizontal and vertical relationships. For instance, information exchange networks among government and nonprofit organizations will exhibit a horizontal relationship because there is no mandated or contractual relationship. However, in public service provision networks, where governments hold the legal power to contract out, privatize, and regulate service provision, the relationships between government and non-government organizations are vertical. Consequently, the interactions among network actors mirror multidimensional structures where the actors are scattered in multiple levels and different sectors and engaged in both horizontal and vertical relationships; thus, their existence and position in the spatial dimension can only be explained by using multiple dimensions rather than a single-flat structure (Fig. 3h).

### Inter-level Relationships in MLMD

Inter-level relationships include all ties among the actors aligned vertically within the boundary of

**Network Structures, Fig. 3** (continued)

**Network Structures, Fig. 3** Hypothetical network structures (Notes: The colors of nodes are based on the level at which each actor is located: *red* for the first level; *green* for the second level; and *blue* for the third level. The shapes of the nodes are based on the each actor's ownership: *triangles* for governmental actors and *squares* for the non-governmental actors)

the same hierarchical structure; thus, actors in the same sector in all levels can interact with each other. Inter-level relationships are distinct from inter-sector relationships because actors in different sectors cannot be integrated under the same chain of command or legal authority. For example, it is nearly impossible for governments to be merged or transformed into a private firm or a nonprofit organization and vice versa. For that reason, even when the number of levels in government and non-government organizations are equal, the same level-to-level relationship does not hold the meaning of interaction among actors with equivalent authority; thus, such a relationship is inter-sectoral, not inter-level. Inter-level relationships in the government sector are dependent on the level of government each actor is embedded in. For non-government sectors, the ties in the inter-level relationship will vary based on how each actor structures their hierarchy based on their free-will, as there is no legal mandate that specifies the number of hierarchical levels the private entities should have (Fig. 3e–g).

### Within-Level Relationships in MLMD

Within-level interaction reflects the horizontal relationship among the actors embedded within the same level and sector. The actors in within-level relationships either possess the same level of authority in the hierarchy or share no comparable form of authority. First, each actor in the same level of government (e.g., state, province) holds equivalent formal authority or legal rights so that no single actor in the same level can dominate another; thus, the relationship between these governments is horizontal. Next, the non-governmental actors, usually in the form of corporations, interest groups, and nonprofit organizations, are legally distinct entities unless the actors share ownership. Therefore, the actors operating in the same level interact in a horizontal manner because their sources of authority are legally distinct. As mentioned above, non-governmental entities can define their own hierarchy so that the number of levels may fluctuate depending on each actor. What the current study proposes is that even though the number of layers in the hierarchy of non-government may vary by

actors, there is no prerequisite that these actors can interact horizontally only when their number of layers is exactly the same. Furthermore, the horizontal network of non-government actors is not predetermined as is the relationship among government actors in the same level but rather is voluntarily organized when the actors form ties in the same single-level structure (Fig. 3b–d).

## Conclusion

While contemporary network research is still centered on policy formation, policy governance, and policy implementation network structures, a new perspective to the network literature is introduced by developing a multilevel multidimensional (MLMD) network model. Departing from research based on the premise of networks as single-level horizontal structures, the model argues that networks are structures composed of multiple levels and multiple dimensions. Future studies may want to use within-level, inter-level, and inter-sector network relationships to investigate networks composed of various actors in multilevels in both government and non-government sectors. Networks are actually an aggregated structure composed of actors that have multiple memberships in networks depending on the level and sector they are embedded in.

## Synonyms

Associations; Contacts; Exchanges; Interactions; Networks

## Definition

Network: A system of individuals/groups/organizations attached to each other in order to share economic and social resources through steady and regular interactions.

## Introduction

Economic instability in the environment of nonprofit organizations often necessitates the development of new goals, products, and services. These goals are sometimes achieved more effectively and at lower cost levels through collaborations. The networking society (Castells 2011) considers networks to be the major alternative to classical ways of organizing social relations, replacing traditional formal interaction means, which have become less functional or even irrelevant in the attainment of individual and/or social group goals.

Networks consist of complex sets of relationships formed by the flows and ties that connect entities and individuals. These connections can facilitate the transfer and circulation of information and messages, which are thought to enhance access to opportunities and the adaptability of group members. Networks are a means to develop and sustain the leverage required in times of rapid change. As such, they are considered a valuable resource for both individual and social units.

Networks assist individuals and organizations to acquire resources in many areas and improve the overall achievements of the network members in solving complex problems. Networks are normally described as comprising interrelated entities, otherwise known as "nodes." Individuals, groups, organizations, or nations involved in these nodes engage in communication processes that are characterized by the quantity and quality of the connections or "ties" between them. The role of ties is to transfer important resources, such as knowledge and information, between members within the network. Some ties are considered "central" to the network's goals, whereas other ties are considered more peripheral, even though network members may still consider their role to be important or even critical. The study of network theories encompasses an integrative field that has evolved from an analysis of the dynamics created between actors within social settings and connected through a "web of group affiliations" (Simmer and Freeman 2004). The dynamics of networks manifest in various types of interpersonal communication, referred to as the *networking* process. The networking process describes the features of interpersonal communication of the individuals who participate directly within an existing network.

## Network Theories

*I. Social capital theory* addresses the importance of an individual's access to resources through social connections. This theory supports the notion that networking, social cohesion, and inclusion are central themes for understanding concepts of commodities and capabilities. Included in social capital theory are the formal and informal social ties and networks among individuals who share norms and values – especially the norm of reciprocity and the stock of social trust that people draw upon to solve common problems (Bourdieu 1986). Social capital generates formal and informal ties, affects decision-making competencies, and plays a substantial role in developing career-oriented connections. According to the social capital theory, the *bridging* and *bonding networks* are widely considered as measures of group level social connectedness.

Bridging and bonding are structured forms of interaction between individuals that promote the ability of social groups to work together and achieve their goals using personal connections. Trust is an important ingredient in the majority of social networks. *Bridging* refers to a situation in which individuals and groups that are geographically remote from each other access vital information. In such cases, social capital includes the norms and networks that people draw upon to solve problems. *Bonding* refers to a situation in which individuals and groups facilitate the creation of strong rather than weak ties. In such cases, social capital involves the element of proximity,

which offers defense strategies primarily to weak social groups or those representing ethnic minorities.

The bridging and bonding types are often generated at various stages of the lives of individuals and are based on ancestry and on cultural, ethnic, military, and additional social group affiliations. Bridging and bonding ties created early in life often extend into individuals' subsequent educational, military, and employment paths and continue to be maintained through much later life stages, thus contributing to the formation of networks.

*II. Social exchange theory* focuses on the processes conducive to variations in types of collaboration according to desired social outcomes. The theory suggests that benefit-oriented behaviors differ from bridging and bonding because the collaboration is less structured to "fit" the partners' wish to maximize benefits and minimize costs. These collaborations can be evaluated as a continuum ranging from low risk-low cost to high risk-high cost joint ventures. Partners in an exchange process "weigh" potential benefits and risks incurred by being involved and adjusting their level of involvement accordingly. When the risks significantly outweigh the rewards, people are likely either to terminate or abandon the relationship or to minimize their involvement. In balanced interactions, different levels of "reciprocity" and involvement in networks are possible. Accordingly, the quality of the involvement is considered an essential aspect for successful collaboration.

## Network Properties

Networks are characterized by the following specific properties: *formation, development, process, and outcomes*.

### Network Formation

Networks are formed to facilitate knowledge transfer and learning from the experiences of others. The extent, quality, and intensity of networks are important to obtain the desirable results. Networks are formed on different levels: (a) on a permanent or temporary basis, (b) for an ad hoc situation or ongoing theme, (c) to operate through a central institution or through dispersed individuals, and (d) based upon specific features of members. Networks vary according to several dimensions.

(a) *Formality vs. informality*: Formal networks have concrete goals and are expressed through the formality of connections, such as professional networks. Informal networks reflect the need and potential of members to be involved in personal and intimate relationships with other network members as in the example of students attending the same course.

(b) *Expressiveness vs. instrumentality*: Networks allow for different levels of "closeness" between members. Instrumentality refers to the attainment of a priori defined goals and is more likely in formal networks. Expressiveness refers to the encouragement of personal opinions that is often evident in ideological networks striving to attain innovative and possibly controversial issues.

(c) *Strength vs. weakness*: Strong network have elements of shared history, adjacent locality, and common experiences. Such a network typically provides opportunities for the creation of alliances and the attainment of goals. A weak network consists of individuals and organizations that are detached from each other and are simply seeking access to information without any obligations towards the members involved. When networks are weak, they become unstable, though some "weak" ties can create "strong" networks because networks with weak ties are more likely to create external ties and access external sources to obtain resources (Granovetter 1973).

### Network Development

The initiative for the development of networks is associated with the urgency of extending knowledge that will lead to individuals gains and organizational performance. A significant factor contributing to the development of networks is *homophily.*

Homophily: refers to the tendency to bond and form associations. A combination of two Greek words – *Homeo* (similar) and *Philos* (friend/acquaintance of) – homophily describes the extent

to which individuals resemble one another due to common ancestry and additional group level similarities (McPherson et al. 2001). Homophily stems from participating in face-to-face interactions and social groups and explains common interests and worldviews and attraction (Granovetter 1973). In the context of larger social networks, this term is used to define social group cohesion.

In networks that emerge based upon the attraction between similar group members, homophily is highly relevant. Today the concept of homophily has been expanded to include additional types of ties that offer some form and/or some level of "similarity," including similarity in membership organizations. Homophily-based connections reduce the likelihood of stereotypes, minimize the possibility of damage to reputation, and increase the likelihood of creating stable connections. This is due to the effect of minimized gaps in preferences that result from the development of shared values, beliefs, and goals, eventually minimizing partners' motivation to behave opportunistically. Homophily-based connections create channels through which information about the trustworthiness of others flows easily and can be tested and verified. The tendency to use and rely upon homophily-based connections is especially strong in senior and/or high-visibility social and political management positions because homophily reduces the possible damage to one's reputation when connections are reported as unstable and disruptive.

The development of networks is especially noticed among organizations. Organizations often create networks even when immediate or apparent causes are missing and the likelihood of failure is high. This is because organizations tend to imitate other organizations that are perceived as being successful. According to the social exchange theory *inter-* and *intraorganizational networks* are observed as the most common formal organizational interactions.

*Intraorganizational networks* constitute the relationships and connection within organizations. Organizational networks provide a modern model of connecting that replaces traditional organizational forms lacking the flexibility and appropriate pace to adapt to environmental pressures and economic squeezes. Organizational networks in contemporary organizations increase the potential for adapting to changing economic and social circumstances as well as new client demands, especially those involving the development and introduction of new technological products and services (Castells 2011).

*Interorganizational networks* differ from intraorganizational networks in that they form a constellation of relationships transcending the informal and formal positions of a single organization. Interorganizational networks are distinguished by their level of cooperation. Strong networking collaborations often find expression in: (a) *Strategic alliances*, where a number of organizations adhere to shared management practices. These strategic alliances seek effective, resource-efficient organizational growth. They share a considerable number of resources and often develop new products and new visions through joint learning and co-creation of commonly shared goals. (b) *Merging organizations* or "mergers," where a stronger group acquires a weaker group with the intention of increasing profits and customers. The literature often addresses these networks as a source of negativity among employees and of conflict at the management level. They find expression in the creation of a culture and a subculture that emphasize the use of "us" and "them" in interpersonal communications. A specific case of interorganizational networks is *professional networks*.

*Professional networks* consist of individuals and groups distanced by time and space. Professional organizations are considered secure paths towards the successful achievement of complex endeavors among group members. Professional networks are marked by increased trust because they establish criteria, reciprocal agreements, and standards and play the role of "gatekeepers" for both relevant and less direct cues regarding the task involved (Williamson 1993). A "trusted" reputation of the participating members increases the likelihood of higher reciprocity among partners. The higher the reciprocity among partners, the more they gain from these professional contacts

and the more likely are these professional networks to evolve into more effective forms of cooperation in the future.

## The Networking Process

The network process – or networking – reflects a personalized process of communication flow between groups of individuals in work and non-work settings aimed at achieving goals such as improving performance. Through the networking process, formal and informal collaborations are formed. Networking is an ongoing dynamic process involving various types of contacts ranging from face-to-face and friendly connections to intermittent and remote relationships. Networking creates interpersonal channels through which information about other individuals and groups can be easily retrieved, tested, and verified. The networking process, within and between organizations, increases the likelihood of organizational performance.

*Networking within organizations*: consist of practices initiated and maintained by managers and employees in the workplace to increase the effective transfer of knowledge. The process of networking within organizations reflects the need to achieve specific goals related to the tasks performed. Networking within organization facilitates the communication process between hierarchical positions. In management positions, the consulting and sharing networking modes are identified as two additional forms of networking that indicate level and extent of networking exchanges and degree of involvement among managers. In addition to the bonding and bridging networks inherent in forming connections between social groups, networking process among managers takes place in a multitude of additional networking settings such as in the context of leisure and hobby activities.

*Networking between organizations* refers to the relationships between the exchange partners based on mutual interests and the need to pursue common goals. Two basic networking modes are reported: *The consulting mode* is basically informative with lower levels of permanency and fewer goals. It facilitates the exchange of knowledge but does not necessitate high levels of trust. Consulting mode connections dissolve as soon as partners attain the immediate expected goal and the information has been exchanged. *The sharing mode* refers to a continuous exchange relationship that promotes long-range as well as short-range goals based on mutual interests involving a high level of trust. This mode enables the transmission of knowledge and facilitates learning. The sharing mode of networking is a common attribute of strong organizational networks. A successful sharing mode evolves into networking collaborations. Some networking collaborations are considered to be temporary, unplanned, and spontaneously created, while others are permanent and characterized by high stability. Similarly, some networking collaborations necessitate a high degree of individual involvement, while others are amorphous and based on ad hoc and even voluntary reciprocity and individual involvement. In both intra- and interorganizational networking processes, *networking motivations* and the *networking context* define the quality of networking:

*Networking motivations* reflect networking partners with a sense of actual and prospective gain from the networking collaborative effort. In all types of networking motivations, the willingness of individuals to involve each other in accessing knowledge and information related to such multiple resources as financial, technological, and information resources is important. The effort invested depends on how partners define those gains. In general, the higher the potential for actual and prospective gains, the higher the level of effort and collaboration invested in networking collaborations. Networking motivations reflect the goals to be reached. When the goals are technical, the odds for improving both the quantity and quality of technical information and knowledge transfer increase. In many organizational settings, networking avoidance is not encouraged, especially when partners are considered reliable. Some of the theories used to explain motivations underlying networking behavior include:

(a) *Risk-Bearing Theory* implies that managers accept a certain amount of risk when seeking the support of networking partners without being able

to assess the extent to which these partners promote another organization's competitive edge.

(b) *Dynamic Equilibrium Theory* assumes that both sides can equally profit from the networking collaboration.

(c) *Innovation Theory* applies when managers are able to convince partners that they will obtain direct or indirect advantages from the networking relationship.

(d) *Networks Exchange Theory* suggests that managers seek to enhance their public image and organizational power. This often defines the degree to which they share vital resources and involves higher levels of risk.

*Networking context*: The "networking context" of networking processes and motivation reflects the effect of *organizational age and organizational size*: Organizational age and size affect the levels of task structuring, allocation of authority, and degree of openness and flexibility in interpersonal relations. Organizational age and size reflect the level at which organizations feel confident and supported by their institutional, social, economic, and political environment. These may increase or decrease the odds of developing, maintaining, and relying upon networking processes.

Larger and more institutionalized organizations have well-developed networks that are also referred to as strategic alliances. Larger organizations increase their capacity to develop and attract additional resources by supporting the creation and maintenance of broad and wide-ranging networks. They often achieve this through collaboration with larger as well as smaller enterprises. In such instances, the potential for successfully combining strong and weak ties increases. In smaller organizational settings, the role of networks remains unclear. On the one hand, smaller and more vulnerable organizations need to use "flexible" networks to reflect the extent of engagement necessary to increase performance without losing exclusive access to existing sources of support. Because small and/or new organizations lack expertise, they are more likely to use networking. On the other hand, they also do not have adequate intellectual, social, or financial facilities for acquiring and exploiting opportunities

### Network Outcomes

Network outcomes may vary according to the degree that organizational partners are successful in increasing access to resources. Due to such dynamic shifts, managers are more prone to seek control over networking constellations and dismiss potentially or actually "unproductive" or "harmful" networks. Alternatively they may opt for either "loose" or "ad hoc" networking and avoid the high risk involved in networks that have a long range and a broad scope. As a result, the connection between networking and performance needs to be further investigated by (a) developing more suitable definitions of networking modes and (b) seeking higher levels of contextual factors associated with the network-performance link.

Networking outcomes, however, are not easy to predict and/or control. When managers are aware of the scarcity of resources that may affect an organization's potential to access vital resources, they may be less willing to share resources and information. Networking between managers in organizations is intended to increase organizational resources and organizational performance. Individuals who use networking to achieve certain goals rely on the assumption that the probability of any individual action reflects the number of other individuals in the network that have acted in a given way or have adopted a similar, expected behavior or attribute. As a result, not all networking modes effectively promote organizational growth and improve performance (Powell 1990).

## Conclusion

A period marked by rapid, profound, and worldwide changes in economic, social, political, ecological, technological, and organizational systems offers greater possibilities for networks to emerge, thus providing exceptional opportunities for linking individuals, organizations, and nations. Networks are often sought because they are considered the most efficient and effective means to produce expected and desired outcomes, such as sustainable organizational

practices and growth in resources. Creating ties is an essential step in information transfer, learning, and co-creation of shared goals though networking. Effective networking modes are characterized by high degrees of coordination, cooperation, and communication. Generally, senior managers tend to network to facilitate connections and promote common goals in order to develop a dynamic long-term vision or outlook. However, networks vary in quality due to differences in types of goals, extent of collaboration, networking relationships between partners, and the organizational context in which the managers are employed.

It is quite likely for network partners to be unwilling to form networks in the first place. Moreover, they may often discard the contribution of partners in gaining the knowledge and increased support required for contemporary organizations. At the organizational level, one possible reason for this unwillingness to form networks is that the global environment expects more competition and creativity in complex solutions. Another possible reason is that today's virtual reality has provided ample possibilities for finding and accessing crucial information that was previously acquired through networks. A third possibility at the individual level is that the cultural environment does not enhance the spirit of collectivism. Rather, it enforces the notions of individualism and personal contribution to individual and group challenges. At the same time, there is no doubt that to achieve creative solutions in today's constantly changing economic, political, and cultural environment and to exploit the ever increasing flow of information, businesses must consider adopting networks as a low-cost, highly effective mode of acquiring the essential parts missing from the human reservoir of knowledge.

# Networks of Governance

Christopher Koliba
Department of Community Development and Applied Economics, University of Vermont, Burlington, VT, USA

## Synonyms

Governance; Networks

## Introduction

There have been many explicit efforts to employ network concepts to the study of complex social structures that arise when public policies are made, implemented, and monitored within the policy studies and public administration fields. The rise of network governance as a major movement within the public administration and policy studies field has been tied to the shift in focus from the almost exclusive focus on governments as *the* actor to multilevel, multisector governance as *the* process of guiding and implementing public policy and public service delivery (see Kettle 2015

for this background). The first recognition that "polycentric" networks of organizations are implicated in public policy was posited by Ostrom, Teibout, and Warner in 1963. Hugh Heclo (1978) is credited with first applying the term *network* to the study of public policy and administration with his introduction of "issue networks" (Rhodes 1997). Heclo presented the issue network concept in reaction to what he found to be the more restrictive (and less pervasive) "iron triangles" – the relatively closed networks of government agencies, legislative committees, and interest groups. Over the last several decades, the volume of research using networks as the unit of analysis or as a metaphor to describe complex governance and policy arrangements has risen, leading to a very expansive and growing body of literature encompassing network governance. This entry cannot capture the complete breadth and depth of this literature and instead, attempts to capture what appears to be some consensus across this disparate literature, some of the basic foundational frameworks that are being used to describe the basis of network governance, and a listing of some of the major theoretical, conceptual, and empirical advances in this arena. This latter contribution is delivered in the form of a table. The entry concludes with a listing of some of the major opportunities and challenges facing the field.

Interorganizational networks have been implicated in descriptions of policy or government "subsystems" (Baumgartner and Jones 1993), the advocacy coalition framework (ACF) (Sabatier and Jenkins-Smith 1993), policy coalition (March and Olsen 1995), policy network (Rhodes 1997; Kickert et al. 1997; Koppenjan and Klijn 2004), and institutional collective action arrangements (Feiock 2013). Since 1990, we also find interorganizational networks described across much of the policy implementation (Gage and Mandell 1990; O'Toole 1997; Hill and Hupe 2002), intergovernmental relations (O'Toole 2000; Wright 2000), and policy tools (Salamon 2002) literature. Interorganizational networks have also been described as third-party government (Salamon 2002; Frederickson and Frederickson 2006), public sector networks (Agranoff 2007), governance networks (Sorensen and Torfing 2005, 2008; Bogason and Musso 2006; Klijn and Skelcher 2007), cross-sector collaborations (Bryson et al. 2006), public management networks (Milward and Provan 2006; Frederickson and Frederickson 2006; Agranoff 2007), certain kinds of strategic alliances (Wohlstetter et al. 2005), and public-private partnerships (Brinkerhoff and Brinkerhoff 2011). Moreover, these networks have also been defined as "goal-directed" networks (Provan et al. 2007) and more recently "serendipitous" networks.

Interorganizational networks have also been described in terms of the functions that they perform, whether service contracts, supply chains, ad hoc channel partnerships, information dissemination, civic switchboards (Goldsmith and Eggers 2004), problem solving, information sharing, capacity building and service delivery (Milward and Provan 2006), learning and knowledge transfer (McNabb 2007), or civic engagement (Yang and Bergrud 2008). Interorganizational networks have also been described as existing across many policy domains, including social service delivery (Provan and Milward 1995; Milward and Provan 1998), land use planning (Koontz et al. 2004), watershed management (Leach and Pelky 2001; Imperial 2005; Lubell and Fulton 2007; Koliba et al. 2014; Koontz et al. 2015), health care (Frederickson and Frederickson 2006; Rodriguez et al. 2007), transportation (Albert et al. 2006; Zia and Koliba 2015), emergency management (Comfort 2002; Kapucu 2006; Kapucu and Garayev 2011; Nowell and Steelman 2014), community economic development (Agranoff and McGuire 2003), and food systems (Sporleder and Moss 2002; Smith 2007; Koliba et al. 2017). In addition to these uses of network metaphors and tools of analysis, particular types of network configurations have been described in the literature, including interest group coalitions (Hula 1999), regulatory subsystems (Krause 1997), grants and contract agreements (Kelman 2002; Cooper 2003; Goldsmith and Eggers 2004), and public-private partnerships (O'Toole 1997; Linder and Rosenau 2000; Bovaird 2005; Brinkerhoff and Brinkerhoff 2011).

## Suppositions of Network Governance

The plurality of definitions of the networks vary in terms of the degree to which networks are entirely governed through horizontal ties or not and the extent to which networks are a "new" form of governance or not, leaving leading network governance scholars to conclude that: Network governance "is rife with disparate typologies and conflicting terminologies" (Lewis 2011, p. 1221).

A definition of networks that are of interest to public administration and policy studies scholars was compiled by Koliba et al. (2010) after a comprehensive literature review at the time. They are "*relatively stable patterns of coordinated action and resource exchanges; involving policy actors crossing different social scales, drawn from the public, private, or nonprofit sectors and across geographic levels; who interact through a variety of competitive, command and control, cooperative, and negotiated arrangements; for purposes anchored in one or more facets of the policy stream*" (Koliba et al. 2010, p. 47). The only part of this definition that is complicated and not exactly uniform is that although these networks tend to be driven by more power sharing relationships, power asymmetries most often exist within virtually any network that is studied empirically. This empirical reality can fly in the face of theoretical presumptions that all networks are collaborative, the result of horizontal arrangements. Despite these conceptual incongruities, there does appear to be a growing consensus around some of the basic properties of networks. This consensus was summarized by Koliba in 2014 (pp. 85–87) as the following suppositions:

- **Networks govern**. Networks exist to carry out some facet or facets of the policy process and policy stream. Networks of multiinstitutional arrangements are formed to carry out the full gambit of policy functions: framing problems, creating or advocating for policies, and implementing policies. Within the PA field, particular emphasis has been paid to the role of networks in *implementing* public policies. However, as classical policy systems theories remind us, public policy is carried out as policy streams coupled. Networks that exist to implement a given policy (regulate, contract, provide public services, etc.) may also be actively involved in the framing of policy problems. The active participation of networks in carrying out one or more policy functions serves as the foundation of its central governance functions (Kingdon 1984; Rhodes 1997; Salamon 2002; Sorenson and Torfing 2005; Bovaird 2005; Koliba et al. 2010).
- **Networks exist within all policy domains**. As classical policy systems theories also suggest networks exist within virtually every policy domain. If one is looking for them, networks are ubiquitous. Networks that persist within a single policy domain rely on that domain to set its boundary conditions and determine network structures and functions. Thus, we may begin to speak in terms of emergency management networks, social service networks, health care networks, transportation planning networks, etc. Although there is likely to be some cross boundary activities, these networks are, by and large, discrete (Baumgartner and Jones 1993).
- **Networks are multiactor and multiscalar**. These domain-specific networks are comprised of agents spanning sectors, geographic scales, and social scale. These networks involve not only governments, but for profit and nonprofit organizations as well. Contracting out and privatization of government services has required the establishment of loosely or tightly coupled networks of co-joined sectors. The kind of ties forged through contracting out and the formation of public-private partnerships are often linked to longstanding intergovernmental ties that link federal, state, regional and local governments in complex networks of intergovernmental relations. Over time, the nature of these intergovernmental ties evolves, shaped by reforms to centralize or decentralize, and signified by trends toward devolution, federalization, de-regulation, or re-regulation (Salamon 2002; Bovaird 2004; Koliba et al. 2010). Lastly, the multiscalar features of these networks are marked by the nested complexity of social scale – as individuals form groups,

which form organizations and institutions and which ultimately give shape to interorganizational networks. Individual, group, organizational, and whole network goals may or may not align with one another. All of these features form the basis of a complexity that poses significant challenges to measuring and managing network performance (Gage and Mandell 1990; Koppenjan and Klijn 2004; Peirre and Peters 2005; Koliba et al. 2010).

- **Networks are usually comprised of mixed administrative authorities**. Although some have hung onto the notion that networks are managed exclusively through horizontal ties, the existence of networks that rely solely on such ties are hard to find. The kind of shared governance models outlined in the Proven and Kenis typology of network governance (Provan and Kenis 2007) rarely exists at the level of interorganizational networks that carry out sustained policy functions. Instead, lead organizations or network administrative organizational structures are in place. These networks have been said to exist "in the shadow of hierarchy." However, networks are often shaped by principal-agent relationships that are decidedly vertical in nature. Thus, most networks of interest to public administration are comprised of mixed authorities, in which command and control arrangements persist for some administrative subsystems or assemblages, with more collaborative structures guiding other subsystems assemblages (Salamon 2002; Agranoff and McGuire 2003; Provan and Kenis 2007; Koliba et al. 2010).
- **Networks are complex**. The multisector, multiscalar composition of network agents combines with mixed administrative ties to present a decidedly complex picture of network structure and function, and network management. Although we will not explore the characteristics of this complexity in great detail here, it is important to note that a significant body of scholarship has been taking shape in the United States and Europe drawing on the parameters of complexity science to study and model these networks. The use of such modeling approaches will only be briefly touched on later. Suffice it to say, the nonlinearity, emergent qualities of this complexity poses significant challenges to measuring network performance (Baumgartner and Jones 1993; Rhodes 1997).
- **Networks are governed and perform**. In spite of the complexity of these networks, they are, to some large degree, governed. They are steered by the decision making of individual network managers, guided by laws, rules, and regulations enforced by institutions and shaped by the policy tools designed and implemented to address public interests and provide public value. To varying degrees, network governance is informed and determined by the explicit performance standards that are set by network governors, defined in legislation, and negotiated through inter jurisdictional or partnership agreements. However, expectations about network performance are also implicitly held by any person with a vested stake in the network's activities. Therefore, networks are governed by explicit and implicit performance standards that are both endogenous and exogenous to the network. The extent to which these standards influence networks structures and functions will vary. This observation has been the focus of many of those who have studied network performance thus far (Provan and Milward 1995; Frederickson and Frederickson 2006; Turrini et al. 2010; Koliba et al. 2011).

## Network Games, Power Sharing and Hierarchy

It is argued here that three basic features of network governance persist. These are the role of network "games" that arise between individual network actors, the importance of different structures of power sharing, and lastly, the persistence of power asymmetries. The governance of networks was first comprehensively addressed in 1997. Rod Rhodes (1997) was one of the first scholars to deeply consider the relationship between governance and interorganizational networks, arguing that governance occurs as "self-organizing phenomena" shaped by the following

characteristics: (1) *Interdependence* between organizations, governance is broader than government, covering nonstate actors; (2) *Continuing interactions* between network members, caused by the need to exchange resources and negotiate shared purposes; (3) *Game-like interactions,* rooted in trust and regulated by rules of the game negotiated and agreed by network participants. Governance, therefore, is characterized by the interdependency of network actors, the resources they exchange, and the joint purposes, norms, and agreements that are negotiated between them over time. These appear to be features of the relationship between two or more network actors. These "governing rules" of network governance unfold across the myriad number of relationships of ties and exchanges occurring between network actors.

In regard to shared power or horizontal resource control and relations, there is a growing body of literature that explores the nature of power in terms of the voluntary bonds forged through shared values and norms. Social psychologists, sociologists, and more recently, behavioral economists have studied how cooperative behaviors come about. Social capital and game theories are particularly useful here. Beginning with Robert Axelrod's now classic iterated prisoner's dilemma experiments conducted in the early 1980s, game theorists have studied the nature of cooperative and collaborative behaviors that manifest between two social actors construed as equals or peers (Axelrod 1980). Most recently an "ecology of games" perspective has been used to study network governance, specifically in relation to watershed governance (Lubell 2013). The application of game theory, social psychology, and behavioral economics to the study of network governance is just in its ancient stages and holds great promise.

A second, more structural dimension of network governance is the network governance framework that is construed as the whole network level involving some degree of power sharing. Having reviewed the growing body of literature on interorganizational networks, Provan and Kenis introduce three models of interorganizational form: the self-governed network, the lead organization network, and the network administrative organization (Provan and Kenis 2007). The most collaboratively structured network governance arrangement is the self-governed network, characterized by balanced flows of ties and authorities. In participant-governed or shared governance networks, authority and power are distributed across the network, as each organizational network node bears social ties between one another. The dominant relational ties operating in participant-governed networks are horizontal, as a participant-governed network depends, to a large extent, on the qualities of social norms that exist between network nodes. "Shared participant-governed networks depend exclusively on the involvement and commitment of all, or a significant subset of the organizations that comprise the network" (Provan and Kenis 2007, p. 234). In lead organization networks, authority and power are more likely to be concentrated within (or through) the lead organization. The stronger the lead organization's authority. In lead organization networks, "all major network-level activities and key decisions are coordinated through and by a single participating member, acting as a lead organization" (Provan and Kenis 2007, p. 235).

The network administrative organization (NAO) is a coordinating body that exists to administer the activities of the interorganizational network. An NAO may exist formally as a distinct organizational node of its own, or informally as a coordinating body (e.g., steering committees, governing boards, etc.) that exists to administer many of the critical functions of the network. "Unlike the lead organization model, however, the NAO is not another member organization. . .. Instead . . . the NAO is established . . . for the exclusive purpose of network governance" (Provan and Kenis 2007, p. 236). Although no extensive studies of NAO structures have been undertaken to date, we may surmise that NAOs will likely forge certain combinations of vertical, horizontal, and diagonal ties when governing their networks' actions. Provan and Kenis observe that the selection of macrolevel network governance structures will be based, "at least in part, on the discretion of key network decision makers"

(2007, p. 236). They suggest that the adoption of particular governance structures is contingent upon several factors: the levels of trust, number of participants, and goal consensus.

Drawing on the core relationship between social network structures and horizontal ties, Provan and Kenis (2007) correlate levels of trust with network governance structures. Observing the limited capacity that shared governance structures have within large groups they suggest that high levels of trust and shared decision making can only occur across networks of limited size. They also anticipate that the degree of consensus around network-wide goals will vary from moderately low in lead organization structures dominated by vertical authorities to the goal alignments necessary to achieve a shared governance structure. They suggest that certain trade-offs between efficiency and inclusiveness are apparent across these forms, with lead organization structures more often viewed as the more efficient structures. Table 1 below provides the student of network governance with the foundational basis on which to consider macrolevel structures of governance.

A third foundation on which to build an empirical understanding of network governance is the nested hierarchical intergovernmental network framework posited by Diel Wright. Intergovernmental networks have been described as possessing a combination of "vertical interdependence" and "extensive horizontal articulation" (Rhodes 1997, p. 38). Because intergovernmental relations are marked by combinations of hierarchical and collaborative arrangements, there has been little consensus around a singular model of intergovernmental relations for the United States. Deil Wright's (2000) three models of intergovernmental relations represent the relationship between local, state, and national governments as taking one of three forms: coordinate, inclusive, or overlapping authority. Each model represents the possible types of relationships that exist between governmental institutions. The coordinate authority model implies that national, state, and local governments are independent and autonomous (Wright 2000, p. 75). The second configuration of intergovernmental relations is the inclusive authority model can be represented as a series of nested, essentially hierarchical relations between levels of government. The inclusive authority model implies that national governments exist as the principals over state and local governments, implying a hierarchical network arrangement (Wright 2000, p. 79). Under this view, states exist as "administrative districts" for federally established policies (Wright 2000, p. 82). The third model of intergovernmental relations suggests that the different levels of government exist as arenas of overlapping authority. Although Wright's model has been applied almost exclusively to intergovernmental networks, it can have a wider application to networks in which substantial institutionally arranged hierarchical arrangements are evident. This is the case in any network in which at least some of the actors come from different jurisdictional scales of government. Wright's view of intergovernmental relations underscores the potential for nesting of government actors within wider networks.

What Wright's framework does not account for are the lateral ties forged across organizations from different sectors. In essence, Wright's framework accounts for the "public sector" column of actors in Table 2. Arguably more work needs to be done to formulate conceptual frameworks that look at the differences in governance structures *within* specific sectors and how the goals, accountability structures, etc., of the for profit, nonprofit, and public sectors influence governance *across* interorganizational networks.

**Networks of Governance, Table 1** Key predictors of effectiveness of network governance form (Source: Adapted from Provan and Kenis (2007), p. 237)

| Governance form | Trust levels | Number of actors | Consensus around goals |
|---|---|---|---|
| Shared governance | High | Few | High |
| Network administrative organization | Moderate | Moderate to many | Moderately high |
| Lead organization | Low, highly centralized | Moderate | Moderately low |

N

**Networks of Governance, Table 2** Range of governance network actors (US context) by scale and sector (Source: Koliba et al. 2010)

| | Social sector | | |
|---|---|---|---|
| Geographic scale | Private sector | Public sector | Nonprofit sector |
| International | Multinational corporations | United Nations; international regulatory entities | International nongovernmental organizations |
| National | Corporations | Federal government (legislative, executive, judicial) | National nonprofit organizations |
| State | Corporations/ businesses | State government (legislative, executive, judicial) | Statewide nonprofit organizations |
| Regional | Regional businesses | Regional government | Regional nonprofit organizations |
| Local | Local businesses | Local government (legislative, executive, judicial) | Local nonprofit organizations; community groups |

## Conclusion: Governing Networks from the Inside

At this point, we are just beginning to understand how power, decisions, and collective actions that comprise administrative functions unfold within networks. Principal-agent, social network, and social capital theories may be used to understand how cooperation and collaboration exist as essential features of network management. Governance networks have been described as taking on certain configurations of administrative authority that shape the flow of power between them. Robert Agranoff and Michael McGuire's studies of community development networks highlight the role that vertical and horizontal relationships play within them (Agranoff and McGuire 2003). Conceptual frameworks designed to analyze social power dynamics are abundant and can be found across the literature of virtually every social science discipline. Of particular interest to us are the kinds of conceptual frameworks that describe the flow of administrative power and authority within or across organizations.

Given the existence of vertical, horizontal, and mixed ties, Donald Kettl observes: "The basic administrative problem [becomes] developing effective management mechanisms to replace command and control" (Kettl 2002, p. 491). According to Kettl, networked public managers "have to learn the points of leverage, change their behavior to manage those points of leverage, develop processes needed to make that work, and change the organizational culture from a traditional control perspective to one that accommodates indirect methods" (Kettl 2002, p. 493). Although classical paradigms in public administration have tried to distinguish administration from politics, in the networked environs of the "disarticulated state" (Frederickson 1999), politics is understood as an integral feature of administrative action. Network governance studies need to take into account the fragmented and dynamic confluence of multiple forms of administrative authority that emerge in networked environs.

A picture of network management is emerging that may be described as the combination of "governance and public management in situations of interdependencies. It is aimed at "*coordinating strategies of actors with different goals and preferences with regard to a certain problem or policy measure within an existing network of inter-organizational relations*" (Kickert et al. 1997, p. 10). Effective network management requires the use of all forms of administrative dynamics, including command and control, competition, concession and compromise, and collaboration and cooperation.

Categories: new governance and neoliberalism; Definition: to be defined; Tags

## Introduction

The term neoliberalism has attracted a great deal of attention and antipathy on the surface of various academic disciplines especially in social sciences. It has been unpacked in different dimensions, and different meanings have emerged in the economic, political, and social sphere which illuminates the term as a fluid concept. At a basic level, the connotation of neoliberalism extends to the economic, political, and social arrangements within the society that encompasses market relations, rearranging the role of the state and individual responsibility. This entry attempts to trace how neoliberalism evolves as a nebula and becomes embedded in the sphere of governance. It is nonetheless important to attune a critical analysis on how the idea of neoliberal thinking resonates with the transpose from government to governance and how far does it fare in rightful inclusion of individuals to perform in an unhindered market.

The concept of governance also has been explored in many fields, especially in public administration and planning, policy-making, political science, and sociology as well. In common parlance, government and governance are treated as synonyms, but recent studies have established that both the concepts are different theoretically and empirically. Governance is a eclectic term. Hence, delineation of the meaning of both the concepts is pertinent, although a precise definition of both is arduous.

## Definition

Numerous definitions of neoliberalism have been attempted, but the concept that seems to be more expressive is the one provided by David Harvey in his book, *A Brief History of Neoliberalism* (2005). The usage of the term "neo" as a prefix to liberalism makes our understanding more transparent to the idea that the neoliberals appropriated "liberalism" and used it to define their Keynesian interventionist political economy. Harvey attempts to define contemporary neoliberalism through the policies of Ronald Reagan, Margaret Thatcher, and Deng Xiaoping. The political figures at the heart of neoliberal turn in the 1980s along with the leaders of the international institutions seemed to have a consensus over the goal of liberating individual entrepreneurial freedom and skills within an institutional framework characterized by strong property rights, free market, and free trade. They share a desire to expand markets into sectors such as education, health care, and water resource. In this way they challenge the conception of nation-state that is tied to the welfare state provisions. Thus, the two definitions of neoliberalism, one of Harvey's and the more general concept of neoliberalism being a renewed version of liberalism, are both complementary on the ground of rejecting the base for liberalism as a postwar consensus.

As such a new form of governmental management has been introduced by the neoliberals to achieve their goals. Consequently, governance has ceased to function only with the idea of the act of "governing" and is increasingly meant to denote a specific form of government that was used in the private sector but is now employed by the government to introduce mechanisms of a free market for decision-making process. The increasing use of the terms "stakeholders," "third-party government," and "civil society," and NGOs signifies the elevation of individuals as negotiating partners in decision-making process. The inference that can be drawn is that the regime of new governance means receding of the state as an advocate of public interest and ascending of private factions, and the government is seen as an actor representing competing interest with the other legitimate actors (Accessed on 22 March 2018 11:15 IST, retrieved from https://journals.openedition.org/mimmoc/2263).

Thus, new governance is a manufactured concept that ushered various reforms in the public sector policies emphasizing the role of non-governmental agents and the free market, gradually weaning away the robust civil government. There would be a synchronization of private industries and the civil society (nongovernmental actors) in various ways to promote overall welfare and equity (Schulz 2012 2515–2516). Neoliberalism is concerned with defending a particular vision and relationship between the state and individuals. It defines and limits the nature of government with

a claim that its very nature is a threat and limitation to individual freedom. The second argument that is forwarded is minimum governmental regulation is a synonym to increasing efficiency of economies (Accessed on 22 March 2018 11:15 IST, retrieved from https://journals.openedition.org/mimmoc/2263). Various scholars have given their own definitions depending on their disciplinary locations and have argued that contemporary governance needs to be understood from a novel perspective. Another aspect of governance is governance failure or failure of governance. In policy domain, this failure is taken as a serious problem in defeatist lines. Some sociologists and social scientists have gone to the extent of considering the entire model of governance as a failure.

## Political Philosophy of Governance

Social scientists have observed a shift in the model of governance since the 1970s. There has been a shift from a hierarchical, sovereign control of the state over its citizens to a model where non-state actors and market participate in the formulation and implementation of public policy. Old governance is state-centric, whereas the new governance is society-centric. This transpose has also generated two contending groups as well. Some scholars argue that the state and the society influence each other. From this perspective they support the participation of society in governance where community and the people influence the government and participate in policy-making. They believe in an approach that includes various non-state actors and the market in steering the society which ultimately led to the introduction of neoliberal policies.

The replacement of the concept of government with governance that seems to be immanent to society seems to encompass both the political and the social sphere and blurs the distinction between the private and the public. It is the withering away of the concept of nation-state and installing the networks of public actors or public authority. The process of substantial subsumption of government under governance needs to be assessed from a different angle and not just a linear analysis of a society progressing from pre-modern societies, democratic society, and finally the society of governance as theorized by Leford. Here, it is precursory to understand the internal logic of this accidental slippage of government to governance (Bonnafous-Boucher 2005, 522–23).

Governance consists of the state which has the sole responsibility of assisting the markets and the communities and civil society consisting of the citizens, NGOs and the groups outside the government but within the public arena (representing and articulating the voices of the excluded), and thirdly, the market creating wealth for distribution. It implies leadership toward societal development rather than mere control orchestrated on the citizens by the act of government. The concept of governance provided the government to search for new rules and processes between "networks of public actors" instead of focusing on an entity having the sole responsibility of governance. This was termed as the "governmental rationality of liberalism" by Foucault (1991). This is the turning point of political philosophy as well.

The classical political philosophy of state, sovereignty, and relation between the governors and the governed is shed, and a theory of domination sets in. Governmental rationality or "reason of state" characterized sovereign authority, independent and administrative apparatus, and most notably an entity upholding power and stability, unlike liberal governmental rationality. Foucault argues that liberalism has twin objectives: firstly to criticize the existing model of power revolving around the center and secondly to analyze power as strategic relation between individuals and groups (Bonnafous Boucher 2005, 521–29). This leads to an outgrowth of governmental practice that outcries "do not govern too much." The management of the public affairs need not be seen as the exclusive domain of the government. The affairs of the government are problems of all, and hence, the various segments of society are involved in steering the society. This approach facilitates the permeability between the government of public affairs and the private affairs of the market which unleashes legitimated forms of political and economic subjectivization and also modes of action that affect the actions of the

individuals. Foucauldian perspective, thus, provides us with an internal logic of the transformation of the nature of state from democratic ideals to ideals-based decentralization of power that is on networks of actors and civil society. (Bonnafous Boucher 2005, 525,527).

But it is not always practically viable. The cooperation between the state and civil society has been taking many forms and dimensions. The constituents of modern governance (market, NGO's, civil society) could not fulfill the basic preconditional and structural necessities on which the aforesaid model rests. They have failed to represent different functional and socioeconomic interests of the society mainly because of the absence of societal self- regulating system. Practical examples of such failures would be illuminated towards the end of the entry.

This system means that the private organizations need to fulfill regulatory functions that are ultimately in the interest of the public. Hence, these actors who represent the public in decision-making process tend to dominate the marginalized. Here, the role of the state within governance is lacking. The state has failed to perform its structural role of providing strong self-regulation, so that the public interests gain precedence over private interests. Therefore, it is difficult to say that the shift from government to governance has been beneficial. Of all the debates on this topic, much discontentment and apprehension have been vented out towards the shift for governance. However, it is too early to consider this makeshift in defeatist lines specifically, since it also allows the market and the civil society to make its own decisive contributions.

Mark Bevir outlines the broad characteristics of governance. Firstly, it combines the administrative arrangements with features of market mechanism and nonprofit organizations. Secondly, it has a multi-jurisdictional or transnational character. Governance combines people and institutions across different policy sectors and different levels of government like local, regional, national, and international. For example, in controlling food policy and quality, different levels of government bodies are needed to be involved. Thirdly, governance has developed the characteristics of increasing range of stakeholders from different sectors like third-party organization to deliver state services. Governing became increasingly a hybrid multi-jurisdictional and plural phenomenon (Bevir 2012, 5–7).

But here it is also pertinent to comprehend why the unleashing of the upper hand of the markets or rather *laissez faire* policy has exacerbated social equalities and the state is reduced to terms synonymous to "class state" or "state for class." To understand this chaos, we can fall back on Foucault's (1991) concept of governmentality. He maintains governmental rationality prescribes a form of law in order to limit the unlimited objectives or "excessive governance" that the state aspires to, for its self-preservation. Hence, the law takes the form of a structure of mediation between law and morality. On the other hand, liberal government rationality derives from the production of rule itself and sets its objectives based on various actions, agendas, and non-agendas that come up in the civil society, and hence their self-limitation is not definitive. But, this absence of self-limiting rule is slowly being also understood as a double-edged sword. Liberal rationality confirms the emergence of political economy. The adjunct of economic rationality to political rationality thus comes to characterize contemporary governmental rationality. And their policies and actions are designed in terms of effects rather than in terms of original rights. "Governmental practices are not examined from a legal point of view in order to determine whether or not they are legitimate" but are judged by their results and effects. This break in the structure of mediation between law and morality and the consequent social tensions and inequalities that followed have put "governance" on defeatist lines, more so because it has caused some serious democratic pitfalls (Lievens 2015, 5–10).

The lack of self-regulating or self-limiting rule of governance is increasingly understood as an onslaught of neoliberal regime. Under this regime, the concept of governance has contributed in the transfer of power from the influence of government and their self-regulating power into the hands of those possessing capital.

Jessop outlines that "state power has become less important in key respects in contemporary capitalism—as governance has become more important however, countering this trend is the survival of the nation state as the principal factor of social cohesion in societies and its associated role in promoting social redistribution" (Jessop 1997, 573–574). Khan marks that international agencies have failed to recognize the basic problem of corruption and governance in developing countries. They have overlooked the construction of capitalism, which is inherently divisive. It often rewards and deprives individuals in arbitrary ways. Ignoring this issue, it is not possible to understand the roots of political instability, political corruption, and the extant political clientelism (Khan 2002). These developments and processes have raised the debate whether the state is an autonomous actor. This slippage of the entity government within governance has led to the domination of the marginalized people by the dominant private actors.

## Neoliberalism and Tryst with Governance

Although a great deal of scholars have maintained governance from the point of view of public management system and delivering services, neoliberalism had reverted and wanted the rolling of the state from a different vantage point. The proponents of neoliberalism had always wanted the state to withdraw its system of distribution of public services and voraciously advocate the primacy of the markets. The underlying assumption of this thought was the belief that state is insignificant to markets, the former being overburdened with excessive taxation and battling to control inflation. This deduces that the postwar state would anyway wither away when it is pitted against global capital and vigorous competition among states. Instead, they tried to carve out an entity that would characterize an entrepreneurial system based on competition and markets and formulate policy-making instead of delivering services. This kind of entrepreneurial pattern of rule favored by the neoliberals is borne from a different concept of state that is "governance" which would steer the society ahead.

Governance moves one step further and dismisses the remaining form of transcendence such as the sovereignty, the nation, or the people. Here, the ideological and political constructs like citizenship, sovereignty, and nation become increasingly symbolic fictions that are not "real" in relation to the social reality characterized by social inequality, hierarchies, and divisions. This growing disenchantment between social reality and symbolic fictions gives way to the dissolution of the state or government. The replacement of the concept of government with governance that seems to be immanent to society seems to encompass both the political and the social sphere and blurs the distinction between the private and the public. It is the withering away of the concept of nation-state and installing the "networks" of public actors or public authority. David Harvey is also critical of the role of the breeding of the NGOs that accompanies the concept of "new governance" with the neoliberal turn. These have stepped up in vacuum especially in contexts where the state withdrew its social provision. Additionally NGOs are not democratic institutions but elitist, are unaccountable except their donors, and by definition distance themselves from those they seek to help or protect irrespective of how progressive they seem to be. They tend to conceal their agendas and prefer direct negotiation with influence over state and class power. They often control their clientele rather than represent it. But the legitimacy of their status is always open to doubt (Harvey 2005, 177).

The inception of the new idea of governance exhibited a rhetoric of less government and more governance characterized by proliferation of networks and the inclusion of the civil society characterized by the citizens. This formation of the constituents of "governance" requires a mention. The valuation for "networks" by the social scientists was inherent in their conviction that the networks would serve to be a distinct structure that would allocate resources and coordinate activities than to the bureaucratic structures and the markets as favored by the neoliberals. On the other hand, radicals, anarchists, and socialists have long

advocated mandate devoid of the capitalist state. Instead, they romanticized the idea of civil society where the idea of individual freedom and the demands of community reconciled. The resultant consequence of these assumptions created the pathway to a reform in the idea of government and was replaced by governance represented by the government, non-state actors (civil society), market, and networks (Accessed on May 1, 2018 9:35 IST. Retrieved from https://www.britannica.com/topic/governance).

## The Agenda for Governance by the Neoliberal Project

The neoliberal theory assumes that the freedom of the market guarantees individual freedom and is fundamental feature of neoliberal thinking. In this regard, the functioning of the state in providing social services and social planning by (obstruct) constructing a variety of welfare systems surrounded capital as a web of restraints that the neoliberal project aimed to overthrow. The interventionist state fostered a social and moral economy through its activities (Harvey 2005, 9–20). Therefore, the ideal model of governance that represented the idea of individual freedom and community was not in sync with the neoliberal agenda of private property and markets. This invites a close discussion and examination of the concept of governance and its actual praxis.

The concept of receding state riding on individual freedom is disseminated into the social worlds in such an appealing manner that it gets entrenched in our common sense which we fail to question. The crucial decision of "who would exercise power" and "how it would be exercised" in the absence of a robust civil government is something academician, economists, and social scientists tended to oversee. The neoliberals would without a doubt place their faith in the self-regulating market economy. And when there is a dire need to expand beyond "markets" to enlarge the decision-making process, the neoliberals fall back upon the obscure concept of "governance." This sets the platform for stakeholders to bargain for settlements with a government stripped from representing the interests of the commons. The state functions to create and maintain a conducive political environment for interrupted functioning of free market and to be specific maintains the territoriality of the region and internal order as well. Hence, in this genre of regime, the individuals with capital are able to participate in decision-making process; in other words a noneconomic actor is incapacitated to the locus of power and representativeness (Accessed on May 1, 2018 10:05 IST. Retrieved from https://journals.openedition.org/mimmoc/2263?lang=en).

The agenda of the neoliberals is not to erode the electoral process or to exclude the people from the democratic process of the franchise. The trick here employed is the viability of democracy which creates, if at all but an illusion, a belief that the people have the autonomy and the capacity to change their lives by participating in the democratic process. It is a myth deployed mainly because neoliberals rob the power from the hands of those elected. Maintaining this belief of the people upon the democratic process and their representativeness is also paramount as otherwise it would lead to fascism (Patnaik 2014, 39). Instead they theorize a kind of rule where power is vested upon neutral markets and the government and its elected officials are operative to create and maintain a state of affairs for competing agents. In this regard, they are faithful to the father of liberalism, John Locke. Locke's regime of liberalism is useful to the contemporary neoliberals in two regard: firstly, for his role in legitimating "disproportionate and unequal possession of the earth" and, secondly, legitimating accumulation of capital through the argument that "gold and silver can be hoarded without injury to anyone." (Accessed on May 1, 2018 10:05 IST. Retrieved from https://journals.openedition.org/mimmoc/2263?lang=en)

The fundamental contradiction within the bounds of governance embedded in neoliberalism is the alluring idea of individualism on the one hand and the desire for a meaningful collective life on the other. When individuals are given the freedom to choose, they inherently have the inclination toward maximizing their opulence and do not strive to construct and maintain collective institutions (Harvey 2005, 69). The appeal for universalism of

freedom in governance might be a double-edged sword. When we talk of governance, we do not mean controlling the citizens directly; instead, we talk of a mechanism of social coordination wherein the common problems of the government and citizens of given localities are resolved.

This new paradigm of governance demands a new conceptualization of tools of public administration that acknowledges the complex network of relations between the horizontal private, public, and nongovernmental organizations. Understanding the tools and toolmakers and their employment in governing social problems remains a domain of enquiry. Under what circumstances does policy implementation take place? With whom do the managers negotiate? How do the managers negotiate with the multiple players and stakeholders in the indirect government and networks? To understand new governance, we cannot simply try to understand the tool makers, we need to understand the role of humankind – the citizens, stakeholders, and the public negotiators who are also the toolmakers and users (Bingham et al. 2005, 548). This is so because numerous stakeholders and public and private actors validate different points of divergence in interests, goals, and goal-seeking approaches. Moving away from interest group formation, striving towards a process of consensus formation, and reaching a stable agreement through which the rights and fair justice are perceived as a challenge for the toolmakers among rival participants in policy-making process (Bingham et al. 2005, 551). In this context, the case of INHD of Morocco can be discussed. Sylvia I Bergh in her analyses demonstrates the critical power governance places in the hands of unelected representatives. It is also the example of the horizontal division of the state in line with the principles of inclusive neoliberalism emphasizing the production of services with NGOs and associations along with the private sector. The analysis of INHD's implication for local governance indicates a paradoxical situation where the widespread discourse of the inclusion of non-state actors that leads to increased democratization and expansion of "civil society" has led to an increase in the unelected officials such as the governors and the civil servants at the expense of the local government and elected councilors. These local elites then tend to represent the civil society, and their social legitimacy is cemented through their alliance to the king. This leads to king-client alliance and henceforth the gradual erosion of their status as political representatives. The governor, the designated official with the authority to authorize expenditure, has the liberty to distribute funds in one month as compared to two months if the services seek approval from the Ministry of Finance. A resultant risk of this kind of power transfer is the precariousness of increased personalization of INDH by him as well by the other civil servants and the marginalization of the other actors. Moreover, the invitation by the king to the wealthy national and local elites to offer funds as acts of organized and private philanthropy leads to the probability of evasion such as tax breaks. Offshoot of such actions by the "representatives of civil society" leads to the breeding ground of corruption, increasing clientelism and capture of contracts and services by the rural elite. The concept of new governance in tandem with the paradigm of neoliberal regime wanted to evolve and diffuse a self-evolving spirit and access to markets via associations. However, the findings of the INDH as a case study of inclusive neoliberalism reveal both the intended and unintended consequences of such an impossibly rational and elaborate system laid down on a very fragile local situation that ultimately leads to weakened political accountability and redeployment of state power (Bergh 2012, 419–423).

## Governance or Network Alliance

The reforms in the public sector during the 1980s owing to the ever-changing relation between the state and civil society occurred in two principal phases. The prominent one was the new public management advocated by the neoliberals vouching for markets and corporate management of the public sector. The latter that followed was an increasing evolvement of constellation of "networks" informed by public sector ethos. Although "network" has various meanings, but in tandem

with neoliberalism, it serves as an alternative of markets and hierarchies. Corporate management reforms in general, involve applying techniques and ideas from private sector management. It weakens the distinction between the state and social order and reinstates faith in a pattern of order be it politically or socially other than the state (See Governance. Accessed on May 1, 2018 11:35 IST. Retrieved from https://www.britannica.com/topic/governance). And these keep a check on the reforms, thus involving performance results, value for money, performance measures, and closeness to the consumer-all tied to the budgetary reforms. Networks are a widespread form of social coordination and managing interorganizational links just as private sector management. Moreover, this kind of governance entails that networks are "self-organizing" meaning they are autonomous and self-governing (Rhodes 1996, 659). Here, "new governance" shifts its attention from internal workings of public organizations to "networks of actors" on whom they increasingly come to depend. While the strengths are recognized, addressing and coping with the challenges of this kind of dependency are also vital. As such, it builds on two bodies of theories – "principal-agent theory" and "network theory." The former theory explains the existence of organizations in a market system creating a paradox in the relationships between principal and agents of third-party government. Even though the principals are bound by the virtue of the purse strings, the agents seemingly have an upper hand. This principal-agent theory explains that since the agents have more information at their disposition than the principals, what they are actually doing at the grassroots is at their discretion, and hence, the principals face moral hazards of having to rely on agents who have competence and diligence they might not fully know. To evade these hazards, an effort is necessary on the part of the principals to improve the accountability of the agents, but this involves costs. Another dimension that the "network theory" adds is that the principals in such relationships might find it difficult even if the agents share basic goals. This theory was developed to understand the intricacies and complexities in modern democracies where power is varied among diverse groups. In such situations, network theory argues that the ideal relation would be of interdependence where no single actor can influence will including the state (Salamon 2001, 1630–1631).

The neoliberal narrative of governance overlaps with rational choice theory. This theory attempts to explain individual actions in terms of rationality which in neoliberal lexicon culminate in profit and utility maximization. This rationality of the agents at the microlevel can be developed to an abstract level as to how to explain the rise and stability of a rule in the absence of a higher authority. Rational choice theorists argue that the absence of any higher authority means that the new institutions are self-enforcing on the individuals (See Governance. Accessed on May 1, 2018 11:35 IST. Retrieved from https://www.britannica.com/topic/governance).

## Democracy in New Governance

New governance seems to be compromising on the democratic ideals of nation-state. In the electoral process, the elected representatives formulate policies which are then implemented by the public servants. In terms of accountability of their competence, the public servants are obliged to the elected members who are in turn obliged to the voting public. The current form of governance represents policies that are formulated and implemented by private actors and voluntary sector actors. Accountability of policies on their part is a tedious task, and moreover, the complex network of actors in the process makes it all the more utopian to hold someone responsible for public policy failure. There is no common consensus as to how to develop democracy in new governance. Concerns about democratic governance first arose in the discussions of economic development. It is not because there was a keen interest in normative democratic patterns but because it would definitely impact economic efficiency especially the effectiveness of providing aid to developing countries. International agencies, such as the World Bank, encouraged developing countries to opt for privatizing their public sectors, promoting competitive markets, and increasing the use of

nongovernmental agencies. The advocacy for markets and networks by the international organizations and donors stems from the agenda for good governance which oversaw the threat it might pose to the democratic credentials of the society by overriding the structure of a responsible and accountable government (See Governance. Accessed on May 1, 2018 11:35 IST. Retrieved from https://www.britannica.com/topic/governance). Lester Salamon discusses the public-financed state delivered mental health services in Tucson, Arizona. The funding for the same is outsourced from the federal and state government programs. While delivering such a service, no federal or state bureaucrat comes in contact with any mentally ill person. Indeed no contact is made by the government with the private agency employee or the local government who actually delivers the service to the targeted group. The project is carried out by a "master project" by a private, nonprofit local mental health authority called "ADAPT" which is responsible for dealing with other local agencies that deal in providing mental health services with funding from the state and the federal government. Salamon draws attention to the fact that the development of newer tools of public action involves sharing with third-party actors, a basic governmental function: the exercise of discretion over using public authority and the spending of public funds. This nature of these tools and the complexity of the government constituting a major share of the discretion on how to carry out the programs and the nature of such services come to rest not with the accountable government, but with the third party. The covert challenge, this "reinvented government" poses is the fact that they engage a range of organizations and organizational types which have limited knowledge and experience of each other's occupational style and cooperation style. Moreover, this network of actors is guided by their own interests and frame of reference, and hence their cooperation might be determined by the level of urgency and time as well. Thus, the task of having a concerted action becomes a major administrative challenge (Salamon 2001, 1613–1632).

The failure of the reformist policies that was adopted after World War II and the immediate postwar reconstruction period thwarted the faith on the state and was instrumental for an instant predilection toward non-hierarchical and cooperative form of governance. In the 1970s, economic growth also slowed down, and it led to the search of alternative ways of socioeconomic development. Thus, the steering of the society fell into the model of governance where the state, market, and the civil society would effectively cooperate in the political steering of the society (Mayntz 2006). But lack of self-regulating rule on the private actors has resulted in the transcendence of the interests of the private rather than the public. This needs to be drawn attention to, as at the grassroot level, the civil society which is assumed to be a homogenous society is not a social reality per se and is embedded in different social categories like caste, class, religion, ethnicity, and gender.

## Conclusion

The recast in the nature of government and the appeasement directed toward the social world in the name of "new governance" with the new liberal turn are incongruent with the democratic ideals of equality, representativeness, and social justice that government conforms to. In this context, the values of freedom and social justice are not necessarily compatible. The pathway to social justice is necessarily embedded on the ideals of social solidarities and a willingness to subsumes individual wants, needs, and desires in the cause for some general struggle as, for instance, struggle for social equality. Neoliberal rhetoric has its foundational emphasis upon individual freedoms and strips off collective action for a common cause (Harvey 2005, 41). Thus, the overlapping and blurring of the entity "government" with governance erodes the basic protective measures that the government entitles its citizens and makes way to individualism that defies the pursuit of collective life. The transpose to new governance embedded with the ideals of neoliberalism also seems to negotiate with a major area of controversy concerning the idea of market failure. This arises when the individuals and firms avoid paying the full costs attributable to them by shedding

their liabilities outside the market. The cases of environmental pollution would be apt in this context where individuals and firms avoid costs by dumping toxic wastes free of charge in the government (Harvey 2005, 67). And the irony is whom do we hold accountable?

The fundamental political problem is the lack of representation of elected members, thus limiting democratic governance and the rise of undemocratic alliances and institutions. This loss of accountability and intervention of government would bear serious repercussions on social beings and hinder their scope to organize well for a collective purpose. This critical power that neoliberalism introduces to individuals thus, necessitates both dialectic and praxis.

## Synonyms

Institutions; Politics; Rules; Structures; Theory

## Definitions

The theoretical framework that explores the effect of institutions on policy processes and outcomes.

## Introduction

The new institutionalism theory provides a lens through which to investigate the context and factors that affect policies. This context includes the formal and informal rules, culture, norms, and ideas that create the conditions, incentives, and limitations that affect people's preferences (DiMaggio and Powell 1991; March and Olsen

1984). The neo (or new)-institutional theory is a later development of the well-known institutional theory, which explores how institutions and rules, as repetitive patterns of actions and practices, affect the behaviors of individuals. It is one of the core theoretical perspectives in political science in general and in studies of public policy in particular.

The definition of institutions developed from a narrow view of formal structures to a broader one that includes networks, informal structures, and recurring relationships and ideas that shape social and political outcomes. The assumption is that institutions, both formal and informal, play an essential part in social and political life. Therefore, there is a need to explore the unique effect they have on individuals, policymakers, and the policy process (Howlett et al. 2009; Lowndes and Roberts 2013; Rhodes 2006).

One of the unique features of institutions is their stability and their influence on the reality in which we live. Institutions include the formal government and economic bodies in different societies such as the congress, constitutions, secretaries, ministries, the central bank, the local or regional government institutions, or different agencies. Furthermore, they include more informal structures such as networks, practices, and stable relationships between different actors in the policy process. While at times their influence may not be readily apparent, these institutions impact political, social, and economic outcomes. They create the context and the "rules of the game" that help us understand the behavior and choices of the various actors within it (Immergut 1998). Therefore, using an institutional perspective allows researchers in public policy to adopt a macro perspective and ask questions that involve institutions as the basic unit of analysis (Howlett et al. 2009).

The complexity of the policy arena requires researchers to understand the rules and conditions that affect people's choices and lead to specific outcomes (Ostrom 2011). For example, how policymakers choose to promote policies in healthcare or gun control depends not just on their personal preferences and self-interests but also on factors related to the institutions of which they are a part or affect them. Examples include their degree of adherence to their political party; the interactions between various parts of the government, such as the balance of power between the executive branch and the legislative branch; the particular point in the electoral cycle; pressure from various interest groups and their relative power; the information the policymakers have; as well as the incentives that lead them to support a particular stance on the issue. All of these conditions create the context and define the options available to the various actors, including policymakers (Ostrom 2011).

## Diversity in New Institutionalism

Today, most institutional researchers apply the new or neo-institutional theory. The old theory of institutionalism focused on describing and exploring the formal aspects of institutions, such as the branches of government, bureaucracies, and the structure of the constitution. The move from the old to the new institutionalism refers to several changes. First, the focus of the research agenda has moved from the consideration of formal structures to a view that also includes the consideration of informal ones (Lowndes 2017). Although the basis of the old institutional theory persists, it has expanded to other directions (Rhodes 2006), including consideration of what is called "the rules of the game." Second, these studies regard institutions as structures that change and evolve, rather than being static. Third, new institutionalism adopts a more critical perspective regarding the institutions being researched. Fourth, it views institutions not just as a collection of units but also as an aggregate of separate sections. Therefore, it advocates investigating the interactions inside the institutions. Finally, it focuses more on institutions as embedded in their context, not just as autonomous structures (Lowndes 2017).

The move toward new institutionalism redirected researchers' attention to less concrete factors such as the norms, ideas, and stable relationships that affect policies. For example, Hall (1993) used the term "policy paradigm" when exploring the policy shift from Keynesian to monetarist modes in Britain. Others studied the effect of policy networks or ideas on policy outcomes. Béland (2007), for example, investigated the effect of ideas on the persistence and change in

social policies in the USA. Researchers using the new institutionalism theory have also examined how collaborative governance, regulatory regimes, the administrative culture, and policy styles impact policy outcomes. Furthermore, it also acknowledges that, while institutions influence people's behavior, institutions themselves are also influenced by individuals and groups (Korpi and Palme 1998).

There are several variations of new institutionalism. Examples include rational choice institutionalism, historical institutionalism, sociological institutionalism, normative institutionalism, and feminist institutionalism. While they all share a focus on institutions, their assumptions, interpretations, and points of view are different (Lowndes and Roberts 2013). For example, rational choice institutionalism starts with the assumption that institutions affect the preferences of rational people to maximize their utility. Therefore, the formal and informal structure of institutions leads individuals and policymakers to prefer the strategies that will maximize their utility within a specific context, based on and influenced by the information they have (Ostrom 2011; Lowndes 2017). For example, voters will vote based not on their actual preferences but on their strategic assessments about how to maximize their utility in a specific institutional structure (Lowndes and Roberts 2013). According to rational choice institutionalism, institutions exist as long as they serve individuals' needs and will dissolve when they stop serving these needs (Immergut 1998).

In a different realm, historical institutionalism focuses on the study of the temporal aspects and historical roots of the social and political interests and power relations between different actors and groups. It also explores the political structures that create, maintain, and change institutions (Lowndes and Roberts 2013). Studies using this approach regard issues over a long period of time and as being path-dependent. The continuity of policy due to past decisions and former policies makes it harder to alter the path. Baumgartner and Jones (2002) claim that, while it is more common to regard institutions as exogenous to the policy process, in fact, they are intertwined. Public policies affect and are affected by institutions and vice versa. Therefore, they are not separate entities.

Sociological institutionalism focuses on the interactions between actors and institutions. It emphasizes the importance of different norms and cultures in affecting people's perceptions and behaviors. This approach explores the narratives and constructions that create the norms and meanings and the effect of the cognitive elements that influence behavior and choices in organizations and societies (Lowndes and Roberts 2013). For example, if we want to understand why a particular policy was implemented, we must look not just at the formal rules of the institutions but also at the actual daily practices of public service employees, based on their organizational and professional norms.

On the one hand, the various forms of new institutionalism invite criticism regarding the lack of clarity in its definitions and methods and the variations in its methods. However, on the other hand, its approach creates methodological richness (Lowndes and Roberts 2013). For example, to learn about the practices of an organization, which might be reflected in informal practices as well as more formal procedures, researchers might use observations. To understand the formal rules of the organization, they could analyze its official documents, rules, and regulations. To investigate the networks in the organization, which encompass both the formal and informal relationships between its members, they could conduct interviews with policymakers and other stakeholders to identify the different types of interactions and determine the influence that they might have on the policy process. Using experiments is another method that can lead to an understanding of the conditions that change individual preferences in different institutional arrangements (Lowndes 2017). Furthermore, narrative analysis can help identify the informal structures, ideas, and paradigms that legitimize the policy and its implementation. Many times, researchers utilize a mixture of methods to determine the impact of various institutional factors, formal and informal, on policy.

### Institutions: Stability as well as Different Kinds of Change

In the last three decades, researchers have begun to deal more with the issue of institutional change. One of their interesting findings is the variation in the forms that this change takes. Stability is

reflected in the tendency of institutions toward path-dependence, which refers to the continuity of policies. However, positive and negative feedback lead, on the one hand, to adaptations in some policies in a way that enables them to persist and, on the other hand, to radical changes in others (Baumgartner and Jones 2002). The change in institutions, however, is not just incremental or dramatic. Researchers have identified different kinds of incremental change such as drift, layering, conversion, and displacement. These variations in change emerge based on the relative levels of power of exogenous and endogenous factors that support or resist change (Mahoney and Thelen 2008).

## Conclusion

New institutionalism theory is in fact one of the core frameworks that policy scientists utilize to understand the effect of institutions on the development of changes in and outcomes of policy. It represents a move from the study of the influence of formal factors on policy outcomes to the inclusion of the informal factors that affect policy. New institutionalism researchers utilize a variety of approaches including rational choice, historical and sociological institutionalism, as well as methodological richness. While the new institutionalism theory is eclectic in its traditions and methods, its focus on the macro level is central to the understanding of public policies.

# New Opportunities for Government Procurement

María del Carmen Sánchez-Carreira
Department of Applied Economics, ICEDE Research Group, Faculty of Economics and Business, Universidade de Santiago de Compostela, Santiago de Compostela, Galicia, Spain

## Synonyms

Public purchase; Government procurement

## Definition

Public procurement is the acquisition of goods and services by the public sector. This concept includes both the purchase by the government at any level (national, regional, or local) and the purchase by government entities (such as state-owned enterprises).

## Introduction

The public sector can play different economic roles: regulator, distributor, producer, consumer, employer, or innovator. Literature has traditionally focused on actions from the supply side. However, the potential of the public sector as driver from the demand side is relevant. In fact, public procurement accounts for 11.8% of gross domestic product (GDP) and 29% of general government expenditure in the OECD in 2017 (OECD 2019). The relevance of public procurement differs widely among countries and sectors.

Among the demand-side policy tools, public procurement underlines. Other demand policy tools are regulation and standards, support to private demand, or systemic policies (Edler and Georghiou 2007).

## Types of Public Procurement

Public procurement can be used to achieve additional policy objectives, such as environmental, economic, and social goals (OECD 2019). Thus, strategic public procurement aims at fostering innovation, increasing the participation of small- and medium-sized enterprises (SMEs), achieving environmental and social goals, promoting circular economy, or contributing to local and regional development.

Several terms are used to refer to public procurement; they are similar, but not the same. This fact may cause confusion, and it reveals an evolution in the terminology from the traditional focus on acquisition of new technology to a broad scope, shifting in an indirect and horizontal tool (Lember and Kalvet 2014; Sánchez-Carreira et al. 2019).

There are different kinds of public procurement, which can be grouped according to different criteria (Sánchez-Carreira et al. 2019). One main classification is based on the importance of innovation and if innovation was the final goal or an unintended result. Following this criterion, three types of public procurement can be identified: regular public procurement, public procurement of innovation, and pre-commercial public procurement. Regular public procurement (RPP) means buying existing goods and services; therefore, it does not require to innovate to meet the public demand. However, innovation could emerge in a spontaneous way and as a secondary result (Hommen and Rolfstam 2009). Public procurement of innovation (PPI) refers to the acquisition of goods and services by the public sector that are not yet available in the market but that might be developed within a reasonable time. Thus, enterprises are required to innovate to meet the public demand. A broader definition of PPI includes all purchasing activities by the public sector that lead to innovation (Rolfstam 2013; Uyarra 2016). Finally, pre-commercial public procurement (PCP) means the funding of research and development (R&D) to obtain innovative solutions not yet available in the market. It aims at generating new knowledge, developing several ideas in parallel, which could be later commercialized. PCP gives a chance to develop innovation capabilities of enterprises while involving a higher degree of innovation and risk. The public sector could acquire some of these ideas, but there is no obligation to buy any of them. It is discussed whether PCP is a demand or supply-side tool, because it could be considered a way to support the generation of innovations or a type of funding for a specific kind of R&D (Edquist and Zabala-Iturriagagoitia 2012).

Initially, the main term to refer to the purchase of technology by the public sector has been public procurement. Other common terms are public procurement for innovation, innovation-oriented public procurement, innovation-friendly public procurement, or innovative public procurement. These terms differ in some nuances concerning the nature of innovation (substantive, complementary, or processual).

Another criterion is based on the link between demand and innovation, and it allows distinguishing between responsive and triggering demand (Uyarra 2016). On one hand, responsive demand means that the demand can respond to innovations, being determined by the willingness and ability to absorb innovations, once developed. It does not mean the origin of the innovation, but it is an incentive for producers. On the other hand, triggering demand refers to the demand that can generate innovations. This form of public procurement encourages innovation more directly, by expressing new needs and contributing to innovate. Other two additional ways are the co-production of innovation by users and producers and the innovations produced by the users with potential to diffuse in the market. This criterion is similar to the one based on the scope of innovation, which differentiates between adaptative and developmental public procurement. Adaptative public procurement focuses on adjusting the existing products or services to the needs of the local market, whereas developmental public procurement aims at generating new products or services at both local and global markets.

Depending on the final user of the innovation, public procurement could be classified as direct, catalytic, or cooperative. This classification can also be understood according to the kind of social needs to meet. In this sense, needs could be intrinsic, if they are used for the own operation of the public sector, or extrinsic, if the public sector acquires goods and services that will be used by others and not by itself. Direct public procurement means that the public sector is the final user of the product, covering an intrinsic need. Public procurement is considered catalytic when the public sector is the initial buyer, but not the final user, given that the needs are extrinsic. Finally, cooperative public procurement is a mixed kind, where the public and the private sector are users of the innovations purchased by the public sector. In this case, both sectors share the need that, in general, is of a social nature (Edler and Georghiou 2007; Hommen and Rolfstam 2009).

In addition, functional public procurement (FPP) has emerged recently to denominate the acquisition of products or services in which the public sector describes a function to be performed or a problem to be solved, instead of describing the specific characteristics of the needed product or service. Public procurers can use a functional description to face the difficulty of describing a product or service that does not yet exist. This modality may foster innovation, because the specifications in the tenders are less rigid, given an opportunity to develop innovative solutions in all public procurements, and not only in those requiring innovations. It allows more creativity and flexibility and reduces the risk of failures. However, the use of the FPP does not guarantee that the offer will be innovative (Edquist 2015).

Concerning environmental aims, three main types of public procurement emerge: sustainable public procurement, green public procurement, and circular public procurement. Sustainable public procurement (SPP) is the broader type, because it includes the three dimensions of environmental, economic, and social aims in procurement (McCrudden 2004; Alhola et al. 2019). GPP refers to a specific kind of SPP aimed at achieving environmental aims, such as reducing the environmental impact of products. Circular public procurement (CPP) goes beyond GPP, contributing to reach a circular economy. In this sense, reducing the use of resources and turning waste in resources through reusing, repairing, or remanufacturing are the main goals. SPP, GPP, and CPP do not necessarily lead to the rise of innovations, as this is not their main purpose. However, they represent an opportunity for the development of new products, processes, and technologies attempted to achieving the intended objectives. Finally, social public procurement (SOPP) refers to the consideration of social issues, such as equity or inclusiveness, which avoid discrimination (McCrudden 2004).

## Opportunities of Public Procurement as Demand Policy Tool

The role of the public sector from the demand side is not limited to its direct effect but also to its indirect effect. Thus, public demand might contribute to economic growth and development, to

foster private demand, to develop new activities and strategic sectors, and to improve citizens' quality of life (Sánchez-Carreira et al. 2019).

The relevance of public procurement is higher in public services, underlining in the area of health. Thus, health is the main focus of public procurement spending in 2017 (OECD 2019), accounting for 30.1% of the total. The public sector is the main provider, buyer, and user of technologies in health. The second most important area is economic affairs representing 16.3%; it includes infrastructure, transport, communication, energy, and R&D. The following areas in importance are education (11.7%), social protection (10.2%), defense (10.0%), and general public services (9.2%). Each of the remaining areas represents less than 5%. It should be noted that environmental protection, which can be a goal of public procurement, equals 3.0%.

Public procurement shows several advantages for public and private sectors and for the society, underlining the following ones (Rolfstam 2013; Lember and Kalvet 2014; Sánchez-Carreira et al. 2019):

- It guarantees a first market, being the public sector the first consumer. This means a safe demand, reducing the risk, which is higher in the first steps.
- It also provides a field for experimentation and a launch market for new products and technologies (e.g., innovation or environmentally friendly products). Thus, it gives opportunities for technological or environmental development, which is more relevant in sectors that lack of a minimum market.
- It can serve as demonstration effect, setting the path that the private sector could imitate. It may be a signal for private users, supporting the diffusion of new products and technologies and encouraging the market to invest and develop new products or technologies. Thus, public procurement does not only contribute to the rise of innovations but also to the emergence of an innovative environment. This environment supports learning and developing new organizational and technological capabilities.

All the abovementioned advantages affect to different actors: the enterprises, because they acquire competitive advantages and enhancing their competences; the public sector and the users, due to the improvement of the quality of public services, the cost savings, and the better assessment and trust; and the users, owed to the better quality of services. As a result, society benefits from public procurement in terms of wealth and social development but also due to the creation of new economic activities, enterprises and jobs, the rise of innovations, or the promotion of local and regional development. The social effects can be larger depending on the range of the goals aimed by public procurement, and in particular, if it considers issues related to the environment, employment, or SMEs. In this sense, the use of a multi-criteria system to assess the public tenders, which is not only based on prices, can help the rise of innovation, environmentally, circular, or social-friendly products. Other tools to enhance innovation or circular economy can be the use of a life cycle approach.

It should be highlighted three elements that may have contributed to increase the relevance of public procurement. Firstly, the trend to privatization and outsourcing in the last decades might be a new opportunity for public intervention from the demand side, due to the growing amount of services acquired in the market. In this sense, public procurement could replace or counterbalance the former direct driving role of the public sector as direct supplier. Secondly, the recent economic recession has demanded the most efficient use of public resources. Thirdly, demand-side initiatives and policies have been implemented at international, national, regional, and local levels. It should be stand out the support of the European Union to public procurement since the beginning of the twenty-first century.

## Barriers, Challenges, and Risks of Public Procurement

Despite the potential of public procurement to trigger socioeconomic development, this policy tool faces several challenges, barriers, and risks

to turn that opportunity to reality. Regulation plays a key role in the implementation and effectiveness of this policy tool. Thus, depending on how it is realized, it may favor or constrain its use, potential, and effects.

Public procurement is a complex process, mainly if it aims at achieving other strategic goals, such as innovation, environment, regional development, or participation of SMEs. In fact, it becomes an organizational innovation for the public sector.

One of the differences of public procurement of innovation or social public procurement is the uncertainty that it involves, concerning both the result and the required time to develop the new product or service. For procurers, it is more difficult to describe the needs or problems to be solved, because they should anticipate future demands. Concerning suppliers, they are not only sellers but also co-creators of the product in collaboration with the public sector, sharing the risk. Therefore, the interaction and trust between the supplier and procurer are crucial.

The main barriers found in public procurement processes are the following ones (Uyarra et al. 2014; Sánchez-Carreira et al. 2019): lack of experience and procuring skills in the public sector, which requires training; lack of experience by potential suppliers, which requires support; and the complexity of procedures, which involves high administrative burden, costs, and time. The introduction of criteria other than price (e.g., value of the offer, environmental, social, or innovation issues) allows to achieve strategic goals, although it faces the resistance of officials used to the simpler traditional system. Other kind of barriers refers to the capabilities and resources of enterprises to participate in public procurement processes. This difficulty mainly affects to SMEs, which may lead to the implementation of policy measures to support their participation. Moreover, the effects of public procurement on regional development are closely related with the capabilities of the existing supply base (Sánchez Carreira et al. 2019). It also raises the interesting debate about efficiency and cohesion.

In addition, some major risks linked to public procurement are corruption, integrity risks (such as conflict of interest), waste and inefficiency, financial risk, compliance of the contract, management of intellectual property rights, or time constraints (OECD 2019; Sánchez Carreira et al. 2019).

Finally, it should be noted that some future challenges will be to assess the long-term impact of this policy tool as well as get policy learning from the failures and best practices in order to improve the design, implementation, and effectiveness of public procurement policies.

## Conclusion

The public sector is an outstanding consumer, due to the size of its procurement. Moreover, it can use their purchasing power as policy tool to achieve several socioeconomic goals. In this sense, its actions may be strategic, leading the creation of new markets, activities, enterprises, and jobs. Thus, when the public sector anticipates future needs, it can act as pioneer, setting the path for the private sector. The public demand requires that the enterprises change their behavior introducing innovation and environmentally or social-friendly products to meet the needs of the public sector. The potential of the public sector as driver from the demand side is relevant. However, the opportunities that show this policy tool face major challenges and barriers that may hinder the effectiveness of this policy tool.

The proper planning of the process, the anticipation of public demands, or the coordination of supply- and demand-side policies are crucial elements to achieve the best results from public procurement (Sánchez-Carreira et al. 2019).

# New Public Financial Management

Isabel-Maria Garcia-Sanchez and Beatriz Cuadrado-Ballesteros
Facultad de Economía y Empresa – Multidisciplinary Institute for Enterprise, University of Salamanca, Salamanca, Spain

## Synonyms

Accounting and budgeting reforms; Financial management in new public sector; Financial reforms in public sector; Modernizing public financial management; New public sector financial management; Public financial management reforms; Reforming financial management in public sector

## Definition

New public financial management (NPFM) refers to reforms introduced in systems, procedures, organizations, and law for obtaining and effectively using public financial resources, which encompass not only expenditures but also revenues and debt in the context of public budgeting, accounting, internal and external control, and financial reporting. Reforms affect "how" to implement public policies searching for efficiency, effectiveness, quality, transparency, accountability, and good governance.

## Introduction

There are some circumstances that may jeopardize the optimal relationship between public financial resources and public service delivery, such as a financial crisis, political changes, conflicts, etc. These situations may limit funding resources; at the same time, citizens' demands are continuously increasing, and they call for an optimal use of the resources they provide to the public sector. The limitation of resources and increase in citizens' demands have led the public sector to seek more effective uses for public money. In this situation, different reforms have been implemented regarding how financial resources are managed by public administrations, searching for efficiency, effectiveness, quality, transparency, accountability, and good governance. These reforms affect budgeting, structural organization, management accounting, and law systems, and they may be categorized under the NPFM concept.

NPFM reforms are involved in the new public management (NPM) model, which was introduced during the 1970s and 1980s in an attempt to modernize the traditional model of public

management that gradually became obsolete as economies had evolved, in both political and social-administrative terms. The NPM model "consists of deliberate changes to the structures and processes of public sector organizations with the objective of getting them (in some sense) to run better" (Pollitt and Bouckaert 2000). This international-level movement began in the 1980s in countries such as Australia, New Zealand, and the UK and later it extended to Canada, Sweden, the Netherlands, and the USA; it aimed to modernize public administrations by improving operations and constructing a more effective and efficient public management system.

Generally speaking, NPM reforms involved the introduction of organizational and management structures derived from the private sector, together with efficiency models ("do better, spend lesser"). In particular, the NPM model involves privatization of public enterprises; the creation of newly created entities, with own legal personality, to provide public services (functional decentralization), as well as externalization, or outsourcing, by which the public administration put service delivery out to contract in the private sector; delegation of responsibilities and competencies to other levels of government, agencies, departments, or entities; the use of controls and monitoring mechanisms to oversight public activities, etc. (see Ferlie et al. 1996; Osborne and Gaebler 1993; Pollitt and Bouckaert 2000). Hood (1991) summarizes the guiding principles of NPM: "hands-on and entrepreneurial management," "explicit standards and measures of performance," "output controls," "desegregation and decentralization," "competition in the provision of public services," "stress on private sector styles of management," and "discipline and parsimony in resource allocation."

From Hood's point of view, the discipline in the use of financial resources through the use of measures of performance and output controls may be called NPFM. NPFM is a form of NPM focused on finance (notice that the difference between NPM and NPFM is the "F") (Broadbent and Laughlin 2013) – i.e., it refers to the implementation of NPM ideas of managerialism, efficiency, effectiveness, equity, transparency, responsiveness, and accountability in financial resource allocation (Guthrie et al. 1999). NPFM is a complex concept with an interdisciplinary character, generally integrated into management theories, organizational theories, and law. This complexity may lead readers to imagine a great difficulty involved in proposing a concrete definition. Figure 1 tries to clarify and sort out the aspects involved in this concept: NPFM reforms are reforms taken in budgeting, accounting, management, organization, and law systems, with the aim of improving accountability through outcome orientation, transparency, monitoring, and responsibility.

## From Public Financial Management to "New" Public Financial Management

Financial management (FM) refers to the way of managing funding resources to accomplish the goals of an organization. Referring to "private finance," there are classic definitions, such as that proposed by Solomon (1963), who indicated that it is concerned with the efficient use of capital funds, or Massie (1971), who described financial management as the activity of a business that is

**New Public Financial Management, Fig. 1** NPFM definition. (Source: the authors)

responsible for obtaining and effectively using funding resources necessary for efficient operations. Even if there are plenty of definitions, all of them agree with the core: *ensuring the optimal funds* – i.e., the maximum possible at the least cost, to achieve the basic goals of an organization from the financial point of view, i.e., profit maximization and long-term survival.

These goals conflict with features of the "P" in PFM (i.e., public financial management), which refers to public sector, a system characterized by:

- *Working in the public's interest*, instead of profit maximization
- *Citizen-based system*, instead of customers
- *Taxation-based system*, leading citizens to be interested on knowing how the resources they provide are used
- *No market competition*, since there is a unique provider of public services
- *Political environment affectation*, leading to possible conflicts between political goals and administrative efficiency

In this regard, PFM is usually considered partially different from financial management, although both have the same core feature: efficient use of funds to achieve specific goals – i.e., *using money well*. Similarly to financial management, there is no one universal definition of PFM. The spectrum goes from the narrowest definition, for instance, Allen et al. (2004), to the most general definition, such as that proposed by Rosen (2002). Allen et al. saw PFM as a set of activities related to budget preparation, execution, and control, accounting, reporting, monitoring, and evaluation. Rosen also includes activities related to taxing, spending, and debt management of governments, which influence resource allocation and income distribution. International organizations have also defined PFM. For instance, the Chartered Institute of Public Finance and Accountancy (CIPFA) characterizes PFM as a system "(. . .) by which financial resources are planned, directed and controlled to enable and influence the efficient and effective delivery of public service goals" (CIPFA 2010, p. 5). The World Bank has recently proposed the following definition: "Financial management refers to the budgeting, accounting, internal control, funds flow, financial reporting and auditing arrangements by which they receive funds, allocate them, and record their use" (World Bank 2015, p. 54).

Currently, it is generally accepted that PFM is not purely a technical system, but rather a complex system of multiple role-players who are interrelated (Pretorius and Pretorius 2008). It involves players from different domains and cuts across different levels of governments; following Andrews (2007), the PFM system involves policy processes and strategic budgeting, budget preparation, internal controls, auditing and monitoring activities, accounting and reporting, and external auditing and accountability. These activities involve different role-players, called core entities (ministry of finance, treasury, audit institutions, parliament, etc.), spending entities (line ministries, agencies, etc.), civil society (media, academia, private sector, etc.), and also in some countries donors.

Despite all these formalities, PFM did not really need any detailed formal definition, since it is something that is generally understood (Guthrie et al. 1999), and it is characterized by some core features:

- Using public money effectively and efficiently
- Having a multiplicity of role-players (governments, governmental agencies, spending entities, civil society, private sector, media, etc.)
- Delivering critically public services to citizens
- Maintaining fiscal discipline to ensure good financial health
- Including all budgetary elements, i.e., both components (e.g., expenditures, revenues, deficits, debt) and parts of the budget cycle (e.g., management, reporting, control, auditing, oversight)

However, these tasks were difficult to carry out in the old and bureaucratic public administrations of the late 1980s, which were characterized by inefficiency and severe hierarchical inflexibility (Pierre and Guy 2000) in most of the countries around the world. The UK was the first country to introduce reforms in the British public

administration when Margaret Thatcher's Conservative government came to power in 1979. At that moment, the British economy was suffering several difficulties; the Thatcher administration concluded that the problem was excessive public expenditure, and several reforms were introduced in an attempt to improve the efficient use of public resources. The first reform they implemented was the privatization of many public services, believing in the greater efficiency of the private sector. These policies did make a positive impact on public finances, in the form of additional revenue obtained from the sale of public companies, and the public deficit was reduced, as were the corresponding interest charges.

Soon, these reforms were expanded to other countries, such as Australia, Canada, New Zealand, Sweden, the Netherlands, and the USA. They began to introduce changes in accounting management systems, budgeting systems, financial reporting, etc. The aim was to improve the efficiency of resource allocation and public service delivery, with a greater emphasis on performance, transparency, auditing, and accountability (Guthrie et al. 1999). For instance, governments introduced initiatives such as:

- Outcome-oriented budgeting systems
  - Linking budgets and policy goals: policy goals should be chosen based on resources collected, allocated, and spent.
  - Development of performance indicators, both financial and nonfinancial measures.
- "Managerialism," which entails more flexible network settings and market-style competition
- Changes to financial reporting systems to improve comprehensiveness and transparency of financial information
- Introducing and improving control, monitoring, and audit mechanisms
- Increasing awareness and responsiveness of governments to financial resources, resulting in governmental accountability

As the reader may imagine, there is a broad spectrum of reforms under the umbrella of the NPFM model, and interventions have been highly diverse over the years in different countries. The divergence of reforms tends to be explained by some contextual factors (CIPFA 2010; Olson et al. 1998): (i) political factors, e.g., distribution of powers, governmental stability, responsiveness of the governments, and administrative law; (ii) economic factors, e.g., the sources of income, development of markets, economic growth, natural resources, and infrastructures; (iii) social factors, e.g., cultural norms, media pressure, and communications technology; and (iv) demographical factors, e.g., population age, health, education, and urbanization. For instance, a huge informal economy, the lack of trained accountants, corruption and family or ethnic loyalties, or authoritarianism, among other factors, tend to block NPFM reforms.

An excellent summary exercise was undertaken by Guthrie et al. (1999), who identified five categories of NPFM reforms:

- *Changes to financial reporting systems*: promotion of accrual-based financial statements and reliance on professional accounting standards
- *Development of market-oriented management systems*: public service delivery mimicking the market by introducing internal and external charging/pricing and contracting out arrangements
- *Development of performance measures*: introducing financial and nonfinancial indicators, output measurements, and benchmarking
- *Devolvement/decentralization/delegation of budgets*: linking budgets with the reporting of financial and nonfinancial results
- *Changes to internal and external public auditing systems*: focusing on monitoring and control of public service delivery, which provides reviews of effectiveness and evaluations

On the basis of these categories, Table 1 summarizes the reforms introduced by the most salient international examples of NPFM reforms. Particularly, it describes the cases of Australia, New Zealand, and the UK, which are the pioneers in NPM/NPFM techniques. As these ideas were immediately extended to the USA, Canada, the Netherlands, and Sweden, it also describes the

**New Public Financial Management, Table 1** NPFM reforms around the world

evolution of NPFM in those countries. In addition, readers may compare the introduction of NPFM in different European regions: other Nordic countries, such as Norway and Finland; some Mediterranean countries, such as Spain and Italy; and some continental countries, such as France and Germany. The aim is to give the reader an overview of the different reforms developed under the umbrella of the NPFM; each of these cases is described in the following section.

## NPFM Experiences

### Australia

Australia was one of the first countries to introduce NPM reforms in the early 1980s, together with the UK and New Zealand; these three pioneers in NPM techniques are jointly known as the Whitehall model, which introduced managerialist ideas to the public sector. Financial changes began in 1983 with the "Financial Management Improvement Program" (FMIP), which enhanced medium-term planning; improved the control on output and outcome with the aim of increasing efficiency and effectiveness; gave more flexibility and freedom to manage and make changes; introduced a budgeting program, requiring the specification of objectives and targets; encouraged a skilled and productive workforce; simplified the body of rules regulating public financial management; and devolved control from central agencies and within departments. One of the most relevant reforms in budgeting led agencies to specify their

output against planned outcomes, and they had to identify performance indicators, resulting in an outcome/output budgeting structure.

In 1987, an important restructuring was carried out, such as merging ministries to produce large departments, and the growing number of public activities was corporatized and finally privatized in the early 1990s. In 1994–1995, financial reporting moved to accruals accounting, and finally in 1999 accrual-based budgeting was introduced. The outcome-output-based accrual budgeting system allowed the true full cost of public services to be shown and improved the asset-liability management.

In 2004, the Management Advisory Committee assessed reform introduced until then, and it concluded that these reforms (agencification, contracting out, performance targets, etc.) were producing undesirable effects, such as fragmentation, coordination problems, control problems, hampering coordination, overlapping activities and resources, etc. As a result, there was a trend toward the reconcentration through "whole of government."

The two last relevant reforms took place in 2007 and 2010. The first one was started by the report entitled "Building Better Governance," published by the Australian Public Service Commission. This report declared accountability, transparency, integrity, stewardship, efficiency, and leadership as the principles of good governance; reforms were focused on organizational culture and structure to improve accountability, responsibility, and communication across the agencies. The report also recognized the importance of flexibility in decision-making processes and risk management systems and encouraged all agencies to implement sound systems for risk oversight and strong internal controls (e.g., audit committees) as key elements of good governance; control systems were also introduced through performance monitoring and evaluation. Finally, in 2010 the Advisory Group on Reform of Australian Government Administration published the report entitled "Ahead of the Game," with the aim of reinforcing the whole-of-government approach. Reforms resulted in more integrated public services focused on citizens' needs; a more open government that takes into account the opinion and collaboration of the citizens; a stronger strategic policy, by building partnerships with academia, researchers, and private sectors; a stronger leadership, by revising and articulating roles and responsibilities of secretaries and clarifying the responsibilities and employment conditions of workforces; and improvements in agencies' effectiveness and efficiency, by introducing shared outcomes, internal red tape, new measures of efficiency, and reducing the size of agencies. To carry out all these changes, a new public sector commission was introduced.

## Canada

The NPM reforms initially introduced in Australia, the UK, and the USA were rapidly disseminated by Canada. Mulroney's administration introduced extensively managerialist ideas and a business approach to the public sector, from 1984 to 1993. During this period, an important reduction in government programs and a downsizing of the civil service were carried out, with the aim of making the public sector more simple and understandable. The so-called Policy and Expenditure Management System (PEMS) was introduced by grouping government programs into sectorial areas that have an expenditure limit; this gave greater flexibility in allocating public resources to ministers and departments. A multiyear revenue and expenditure plan, which required the government to identify priorities, was also introduced.

In 1990, the prime minister of Canada published the white paper entitled "Public Service 2000: The Renewal of the Public Service of Canada," which introduced a reduction in bureaucracy and improved public service delivery by reforming management systems, structures, and operations and improving the motivation of civil servants. From 1994, important budget cuts were developed, resulting in a new expenditure management system (EMS) introduced in 1995: program increases were financed by reallocation of resources, focusing on performance, and this gave the flexibility to achieve results and adjust programs by introducing long-term strategic planning and business plans. In addition, the

improved reporting to parliament system (IRPS) with the aim of improving accountability consisted of performance reports and reports on the plans and priorities of ministers and departments. In addition and with the aim of improving accountability, a results-based management and accounting were implemented through the publication entitled "Accounting for Results" by the Treasury Board in 1997. This described results measurement practices to link outputs and outcomes with the available resources. In 2003, the government moved to full accrual accounting, replacing the previous accounting standard, which was a mix of accrual and cash accounting, depending on the transaction.

Due to the cases of corruption and scandal among political parties in Canada in 2004, the Federal Accountability Act was introduced in 2006. This enhanced the power of the auditor-general and introduced some restrictions to avoid fraud and corruption – e.g., a 5-year lobbying ban, protection for whistle-blowers, control of the money spent by the government, a limit on donations to political parties, etc. Internal controls, auditing, and independent oversight offices were also introduced.

Since 2003, the Financial Administration Act has suffered several reforms. This Act establishes the organization of the financial administration in Canada, assigns responsibilities to the workforces, establishes the internal auditing systems, and regulates public money and public debt, etc. The Act is continuously updated so as to adapt to macroeconomic and national changes.

## France

Traditionally, France is characterized as one of the most centralized states in Europe, being resistant to the ideals of the NPM model. Nevertheless, although the orientation to NPM is different to that in Anglo-American countries, France has introduced several relevant reforms with the aim of boosting the public sector. In the late 1960s/early 1970s, one important administrative reform was introduced in France, namely, the rationalization of budgetary choices. This policy was intended to improve the quality of budgeting decision-making through introducing cost-benefit analysis, using planning-oriented budgeting programs, and developing managerial tools for budgets. In the 1980s, an important decentralization process took place in France. This measure enhanced the power of local governments, although it focused on the distribution of political power, rather than improving administrative efficiency and budget management. It was not until 1989 that another reform was held. Three different governments (Fabius, Chirac, and Rocard) developed the final policy entitled "Public Service Renewal," by which the service quality and public servants were evaluated using performance indicators. During the 1990s, other reforms were introduced, highlighting the increased control over spending at local level.

In 2001, the Institutional Act on Budget Legislation (*Loi organique relative aux lois de finance – LOLF*) introduced performance-oriented budgets and a cost approach to policies and a new accountability framework. The budget was reorganized, from 850 line items of expenditure to 150 programs, and the input-oriented budget was replaced by a results-oriented budget, introducing performance indicators based on goals, costs, and expected results. The LOLF also required macroeconomic projections and medium-term projections of expenditures and revenues, and the accrual accounting system was introduced – although budget remained on a cash-based system. In addition, accountability and transparency were improved by increasing parliamentary power in budgeting. In 2004, the first set of public accounting standards were published, based on the International Public Sector Accounting Standards (IPSAS).

After President Sarkozy's win in 2007, at the start of the international crisis, a general public policy review (*révision générale des politiques publiques*) was held, leading public administration to an in-depth review of public spending, fiscal imperatives, and constraints over deficit and debt. Reductions in expenditures were achieved through several austerity measures and organizational reforms; for instance, the number of ministers was significantly reduced and territorial state administration was reorganized, increasing the power at the local level in the

implementation of public policies. This allowed overlapping activities to be eliminated and the promotion of synergies between different levels of governments. Outsourcing was also used with the desire of improving efficiency and quality in public service delivery. In addition, the number of civil servants was significantly reduced, and there were cuts in housing policy, subsidies to SMEs, retirement pensions, health systems, etc.

More recently, President Hollande boosted the National Pact for Growth, Competitiveness and Employment (November 2012), which is built around the reduction of labor costs, promoting innovation and the internationalization of French companies, simplifying fiscal issues for business, and introducing structural reforms in public finance. This was in response to the European Council's recommendations for ending the excessive deficit in France, as recommended for other country members. Continuous austerity reforms consisted of further reductions in expenditure, and additional revenue measures are being updated and can be consulted on the European Commission website: www.ec.europa.eu.

### Germany

In Germany, NPFM reforms have been limited, and most of the changes have been made at local level due to the country's highly decentralized federal system, with most policies being delegated to the Länder and local levels. Until 1990, the public agenda was dominated by the reunification process, and only after this milestone, when the German fiscal crisis occurred, did the NPM model arouse interest. Germany is usually named as a latecomer to the NPM model, since real reforms were not carried out until the 1990s. Such reforms of the federal government may be grouped into four programs: "Lean Government" (*Schlanker Staat*) in 1995; the so-called "Modern State – Modern Administration" (*Moderner Staat, Moderne Verwaltung*) in 1998; the "Focused on the Future: Innovations for Administration" program (*Zukunftsorientierte Verwaltung durch Innovationen*) in 2006; and more recently, in 2010, the program called "Network-Based and Transparent Administration" (*Vernetzte und transparente Verwaltung*).

The NPM reforms were initiated at local level by the KGSt association, which promoted administrative reforms based on an agenda of managerialism, contractualization, marketization, and outsourcing. The KGSt reported on the heavy bureaucracy, excessive rules and impersonal procedures, and the high increase in state tasks and expenditures. A "New Steering Model" was implemented in some large cities, highlighting the reduction of public tasks and state intervention, the separation of political and administrative functions, and the promotion of contracting in public service delivery (Guthrie et al. 1999). These reforms were slowly triggered toward the federal level, resulting in a bottom-up model. Between 1993 and 1995, different working groups debated reforms of accounting systems in public administrations, resulting in test pilot schemes to carry over unspent resources and cost accounting in specific areas.

In 1998, with the second cited program ("Modern State – Modern Administration"), flexible budget management was introduced with the aim of transferring resources toward areas of greater need. The goal extended the concept of "lean state" toward "enabling state," for which tasks of the state and administrative systems were reorganized, cooperation between different levels of government and the private sector was promoted, and efficiency and transparency were encouraged in the administrative system. For this, total quality management and control systems were introduced in different areas, as well as an output orientation in budgeting systems and benchmarking in several departments, and transparency was enhanced giving relevance to electronic government. In addition, an accrual accounting system was introduced to the federal administration, which allowed the need of resources to be controlled by output-oriented performance measures.

The third cited program, known as "Focused on the Future: Innovations for Administration," was held in 2006. This was an extension of the previous program, highlighting the role of electronic government, with the aim of reducing the costs of administrative services, and increasing transparency. Digital government, e-government,

or online governmental services have been continuously developed in Germany since 2005. In 2008, a package of reform (Budget and Accounting Reform Task Force) was implemented, among which performance budgeting and accrual accounting were introduced to the German budget system, with the aim of improving efficiency in budget allocation, as well as transparency, since it gives more information about financial health than cash accounting. The traditional "lines" of budgets are replaced by "programs," which represent the outputs. With this reform, Germany moved from an input orientation to an output orientation budgeting system, which facilitates the decision-making process. In 2009, the *Bundestag* (federal parliament) and the *Bundesrat* (federal council) passed a law with the aim of modernizing the Budgetary Principles Act. This law ensured harmonization of governmental accounting at federal and state level, by encouraging the two levels to implement an accrual accounting system. Nevertheless, cash accounting was still used to provide some information for statistics goals. Further standardization is required but this was partially abandoned in 2011.

### Italy

The first great NPM reform worldwide was the privatization process. In Italy, privatization was extensively applied by the Fascist government in the 1920s, but it was used as a political tool to increase the support of capitalist powers. However, the most relevant NPM reforms were developed from the 1990s. From that moment, the privatization process was mainly focused on the banking sector and utility services, and several reforms were introduced in the PFM, such as changes to the rules of the formulation of the state budget, the introduction of cash constraints, redefinition of local governments' power and the devolution of some competencies to regional governments, the introduction of citizens' charters and rules of private employment for public employment, the introduction of control systems on public spending, and the redesign of competences of the National Audit Office, among others.

The budget reform introduced by Law 362/88 was a great step in NPFM; it set a balanced budget requirement and introduced the long-term budget (*documento di programmazione economica e finanziaria*). This was the first attempt to implement a medium-term financial framework, and it introduced quantitative measures to evaluate the cost of new policies proposed. The second relevant budgeting system reform was introduced at the end of the 1990s, through Law 94/97. The most relevant change was the restructuring of the budget into basic units (*unità previsionali di base*), which were connected to specific cost centers. This reform allows the allocation of public resources to be connected to results, endowing a more outcome-oriented budget management.

In 2008, Law 112/08 established a multiyear program and limited the modification of expenditures. Since then, several reforms have been introduced to combat the international crisis that greatly affects Italy. In 2009, the central administration had to introduce an innovative structure of the annual financial budget forecast, and the traditional cash accounting was partially modified by also introducing the accrual accounting system. This resulted in a mixed cash-accrual accounting system. However, this situation was closely modified, leading to accrual basis. Regional and local budgeting and accounting systems were also updated in 2000, introducing accrual accounting and cost and performance orientation.

The Stability Program approved in 2011 led to the government achieving a balanced budget in the medium term, thanks to fiscal adjustments: cuts in public spending, reform of the tax system, implementation of fiscal policy reviews, changes in the pension system, limitation of cash transactions, penalties for tax evasion activities, a reduction of central and local administration, and abolition of province governments.

### New Zealand

New Zealand was one of the pioneers in introducing NPM/NPFM ideas, together with Australia and the UK. After the election of the Labor government in 1984, the government followed the user-pays principle, leading consumers to pay the full cost of the public goods and services they consume. Looking for efficiency in public administration, the first milestone was the

State-Owned Enterprises Act in 1986 (called SOE); some new state-owned enterprises were created, and others were privatized by selling governmental assets of state-owned enterprises or the whole enterprise to private buyers. Several governmental departments took a market orientation, with a special interest in efficiency and profitability. Corporatization and privatization processes were very strong, and they were developed during the 1980s and 1990s.

After that, the State Sector Act (SSA) was introduced in 1988. It defined state public sector organizations in New Zealand, and it introduced reforms in the shape of public service delivery. Permanent heads were managing governmental departments, the State Services Commission and the Public Service Commission, and then they were replaced by chief executives who employed all staff (public servants) and were responsible for the functioning of departments. The SSA also introduced a labor relations law in the public sector, which was similar to the labor act in the private sector. In addition, some departments were reduced, and activities of policy advice, operational functions, and monitoring tasks were separated. In addition, several public services were devolved to the private sector.

In addition to the SOE and SSA, in 1989 the Public Finance Act (PFA) was introduced in New Zealand. Then, departments obtained funds according to the cost of the public services they provided, leading them to pay attention to outputs and outcomes instead of input and activities. In addition, accrual accounting was introduced, and it required accrual budgeting and financial reporting by departments. Nevertheless, whole-of-government flows still followed a cash basis until 1994, when the Fiscal Responsibility Act (FRA) was introduced. In addition, it required the government to set out fiscal objectives and report how it was fiscally responsible.

Reforms stopped partially in 1996 with the *Schick Report*, which criticized the consequences of some of the reforms introduced during the 1980s and 1990s: poor coordination, duplicated activities, fragmentation of public administration, limited participation of citizens in the government, etc. In 2001, the "review of the center" elaborated by the Advisory Group recommended the following: improving coordination among departments and different public organizations, orientation to outcomes instead of output, involving citizens in policymaking and public service delivery, and strengthening the public service culture. Following their assessments, new reforms were introduced in 2004, such as the State Services Amendment Act that strengthened the coordination in public service delivery and the Crown Entities Act (CEA) that regulated the power, governance, and operations of the Crown entities, with the aim of improving accountability.

The latest set of changes was the State Sector and Public Finance Reform Bill in 2012, with the aim of improving the quality of public services, innovation, and efficiency in management systems and improving performance (i.e., to provide more and better public services with fewer resources). These reforms introduced changes in the most relevant acts in New Zealand, such as the SSA, the PFA, and the CEA. For instance, a multicomponent purpose-based appropriation (MPA) is established for department expenses, which divides expenditures into categories that may be combined in a single appropriation where they contribute to a specific purpose; and reporting was also strengthened, requiring departments to publish strategic intentions for the next 4 years, information related to cost-effectiveness, and forecast financial statements for the following year.

Local governments in New Zealand have also been highly reformed under the NPFM principles. Rationalization of the strong power of local governments in New Zealand began in the 1970s with the Local Government Act. However, the most important restructuring process was held in the 1980s, reducing the number of local bodies from 850 to 86 multipurpose local authorities. Such a reduction could take place thanks to the important privatization process. Another reform at the local level was introduced by the Local Government Amendment Act in 1996, which allowed local authorities to borrow directly from financial institutions, and they were required to prepare long-term plans. Again in 2002, a new Local Government Act was introduced; then, local authorities

were required to publish long-term community plans, detailing activities, funds, and rules, which focused their attention on citizens' needs and demands.

### Nordic Countries (Norway, Sweden, and Finland)

New public management reforms in Norway have traditionally been reluctant; the good economic conditions and a well-functioning public apparatus lead Norwegian governments to be a loath reformer. A few reforms were adopted with the main goal of management by objectives and results, for instance, (i) in the early 1990s, all public sector units had to disclose an activity plan annually, focusing on results, introducing monitoring systems, and using incentives (e.g., pay for performance); (ii) in the mid-1990s, performance management was introduced to the financial system, and a structural devolution process was developed by which central administration transferred authority to state-owned companies; (iii) in 1999, a reform program enhanced a user-oriented public sector, allowing local governments to spend with more freedom; (iv) in 2000, electronic government was developed, and the Internet was used to involve citizens in public affairs; (v) the most aggressive reforms were developed in 2002, including partial privatization of state-owned enterprises, contracting out and outsourcing for public service delivery; (vi) in 2003, parliament introduced the accrual accounting system in some government departments, but they did not accept accrual basis for budgeting system; finally (vii) from 2005, governments were contrary to NPM model, and reforms were focused only on the digitalization of the public sector.

However, Sweden has been more active in NPM reforms. Privatization was important during the 1970s and 1980s, with the aim of reducing public spending. In 1989 a relevant budget reform took place in Sweden, which led the budgeting system to a 3-year cycle; from that moment, budget reforms were intended to enable performance orientation, introducing management by results and greater control over management pay, personnel, and internal organization (Wilks 1995). The traditional expenditure-oriented accounting was replaced by a cost orientation, and public agencies had greater freedom to determine internal organization. Nevertheless, such agencies had to assess their performance in an annual report of expenditure, performance, and productivity, which was used to propose their future goals (Wilks 1995).

In 1992, the "ESO report" developed by Molander encouraged significant improvements in the budgeting system. Changes were implemented in the late 1990s, such as a top-down approach to budget decision-making, leading agencies to have more power, a triannual ceiling for expenditure together with a margin to face uncertainties, monthly follow-up of expenditures, rating of agencies based on self-reporting and control from the national authority, setting up performance indicators, and accrual-based financial reporting. Between 1994 and 2006, Göran Persson led a new wave of reforms with the aim of reducing Sweden's budget deficit. These reforms were focused on the following initiatives: new government budgeting system (VESTA), characterized by performance orientation – i.e., resources were allocated in accordance with political priorities, which related to budget and policy; redesigning the competences of the National Audit Office, giving it more independence; liberalization of some industries, such as telecommunication, mail, and transport infrastructures; trust in information technology to improve government productivity and transparency; and 3-year ceiling on public expenditures for each ministry, giving some flexibility in distributing expenditure over the 3 years. Between 2007 and 2011, a reform program for "Growth and Jobs" introduced different reforms in the labor market, education system, and housing market to promote long-term development with sustainable growth and full employment. Such reforms have been updated annually since 2011 in the national reform program.

In the case of Finland, NPM had a different meaning. There were no great privatization movements, and reforms became relevant in the late 1980s and during the 1990s based on the report entitled "Decision in Principle on Reforms in Central and Regional Government." Between

1989 and 1997, public administration was reduced, and several agencies belonging to ministries were closed, others were consolidated into their respective ministries, and in some cases their tasks were transferred to local government. In 1991, reforms were introduced in the human resources management system, leading to the decentralization of staff and performance-related pay. A market orientation system was introduced in public service delivery, through the report entitled "High-Quality Services, Good Governance, and a Responsible Civic Society" in 1998. This resulted in the conversion of agencies into public enterprises, which were off-budget, and public services (especially support services and infrastructures) were chargeable.

Budget reforms were designed in 1988, seeking flexibility and accountability. These reforms were implemented during the 1990s. In 1992, expenditure ceilings were introduced, but at the same time, ministries received more responsibility for deciding the allocation of public resources. In 1987 the results-oriented budgeting was piloted and was finally introduced in 1994; this required the definition of performance indicators. In 1998, the accrual system was introduced in government accounting, and classification of budgets was reduced.

Finland underwent a constitutional change in 2000; one of the most relevant changes was the strengthening of the parliamentary system that led to legal changes. In the 2000s, citizen participation was encouraged, and the e-government system was highly developed and implemented. Finland was the first country to pass a law on electronic administration, which also stimulated transparency, ensuring the right of access to information on the use of public resources.

In 2004, reforms enhanced performance management and accountability systems by requiring ministries and agencies to report to parliament targets concerning outputs, efficiency, effectiveness, quality management, and human resources development. In 2010, the performance management system was also remodeled, introducing two categories of performance targets: common targets, from the government program, and specific targets, from specific ministries and agencies.

### Spain

In the case of Spain, in the late 1970s and during the 1980s, reforms focused on restructuring the organization of public administration, traditionally inaccessible for citizens and totally centralized in the Francoist dictatorship. Firstly, there was a general aim to break with the "privileged" bureaucracy dating back to the Francoist regime. In 1984 the Civil Service Act was reformed to weaken the power of "public corps" (*cuerpos públicos*), introducing recruitment committees, some elements of performance-related pay, etc. In addition, devolution was another fundamental part of the reforms, and local and regional governments were empowered. Privatization was also introduced after the Francoist regime. When the Spanish Socialist Workers' Party (PSOE) came to power in 1982, some NPM reforms were introduced, such as a clear-cut distinction between politicians and civil servants, increasing the quantity and quality of public services, implementing control systems in administration offices, and the privatization of some public corporations. In the mid-1990s, when the Conservative Party (PP) won the 1996 elections, another great privatization program was implemented.

However, despite innovations introduced based on the NPM model, there was a lack of financial management reforms. In 1984, budgets were classified into different expenditure programs in order to link the budget and with public policy objectives. This change introduced an output orientation in the Spanish budgeting system. During the 1990s, with the aim of meeting the Maastricht criteria, some reforms were held in the budgeting system. Law 18/2000, called the General Law of Budget Stability (*Ley General de Estabilidad Presupuestaria*), required financial balance in budgets, allocation of public resources on the basis of efficiency and quality of policies, multiyear planning of budgets, and information on the allocation of public resources with the aim of increasing transparency. It also introduced

forms of accrual accounting and limited performance indicators. It was updated in 2006, allowing for occasional deficits.

However, since 2008 the Spanish government has imposed severe reforms to combat the devastating consequences of the international crisis in Spain. With the Royal Decree-Law 20/2012 to ensure budget stability and enhance competitiveness, several reforms were introduced in the labor market (compensation, severance payments, unemployment benefits, wage freeze, etc.) and the fiscal system (increases in VAT, corporate taxes, personal income taxes, etc.). In 2014, Law 15/2014 of the rationalization of public administration and other administrative reforms held a reorganization of public administration with the aim of reducing public spending; this implied the integration of some agencies, foundations, or bodies that share similar competences. In addition, this law boosted electronic administration for reducing bureaucracy and costs, as well as introducing changes in the civil servant regimen of employment.

### The Netherlands

The Netherlands is a decentralized state, with three levels of government: central, provinces, and municipalities. Dutch NPM reforms have usually been developed by the central government, being characterized by the decentralization of task to agencies and local governments. Pollitt and Bouckaert (2004) described in detail different reforms developed and implemented in the Netherlands based on the NPM model. The NPFM reforms have been more extensive than changes in management and organizational systems, especially since the late 1990s. Until then, initiatives for modernization of the public sector were focused on functional decentralization, through the creation of semipublic agencies, called ZBOs (*Zelfstandig Bestuursorgaan*), to provide public services. In addition, some relevant privatizations also took place at this time, for instance, the Postbank, Posts and Telecommunications, the Fishery Port Authority, and the Royal Mint. This resulted in a reduction in the number of civil servants. In addition, administrative decentralization was also adopted, by which central government transferred some tasks to the provinces and municipalities.

At the end of the 1990s, the Dutch government introduced a performance-oriented budgeting system, through the reform "Responsibility in Budget Policy" (*Van Beleidsbegroting tot Beleidsverantwoording*). More than 65% of the budget was covered by performance indicators, highly output oriented. This reform totally changed the composition of the budget, replacing items with policy articles. With this program, the Dutch government improved the allocation of public resources, correlating budgets and policies, which resulted in increased accountability. During this period, changes in the accounting system were also introduced. In 1999, the government was interested in introducing the accrual-based system, which had been recommended in the report entitled *From Policy Budget to Accounting for Policy* (*Van Beleidsbegroting Tot Beleidsverantwoording*). In 2001, the government announced a plan for implementing the accrual accounting system only, throughout the government, but this plan failed in 2003, and while most of the agencies applied the accrual-based system, other government organizations continued to apply the traditional cash-based system.

Between 2003 and 2007, a new reform was compiled, called "A New Government" (*Programma Andere Overheid*). This program aimed at administrative reform through the reduction of bureaucracy, improving public service delivery, redesigning internal organization, and redesigning relationships between different levels of government. For all of this, different initiatives were carried out, such as promotion of e-government; overlapping tasks and interfered rules among governmental departments were dropped; the government continued performing only the core tasks, and the rest were transferred to the market or civil society; some departments were merged (e.g., Justice and Home Affairs, creating a Ministry of Safety); and subnational levels of government adopted a performance orientation in budgets, gaining more freedom to spend public money. In addition, during this period the Audit Function Quality Plan tried to

improve the performance of audit departments; these departments were finally merged into one Central Audit Directorate in 2008.

Finally, another important reform in Dutch public finance took place between 2007 and 2011, called the "Renewal of Central Government" (*Programma Vernieuwing Rijksdienst*). The key idea was that central government was able to work more effectively by reducing in size, which in turn reduces public spending. Specific initiatives around deregulation, centralization of some staff functions (specially support services), and interdepartmental cooperation were implemented. This reform was built around staff changes through two subprograms: "Civil Servant for the Future" (*Ambtenaar van de toekomst*) and "Central Government for the Future" (*Overheid van de toekomst*), which aimed to professionalize staff.

### The UK

The UK was the first country to begin reforms aimed at NPM, starting with the privatization of many public services by Margaret Thatcher's Conservative government. Conservative governments from 1979 to 1997 championed and applied wide-ranging privatization in the UK, believing in the greater efficiency of the private sector and in the positive effect of the industrial restructuring process. Indeed, these policies did make a positive impact on public finances, in the form of additional revenue obtained from the sale of public companies; thus, the public deficit was reduced, as were the corresponding interest charges. Moreover, the expenses of loss-making companies were eliminated, and tax incomes rose as these activities became profitable in succeeding years.

However, the privatization process was only the result of severe reforms of the civil service in the UK. From the arrival of Margaret Thatcher's government in 1979, recruitment was frozen with the aim of cutting public expenditure. In 1982, the Financial Management Initiative was introduced, and the Efficiency Unit tried to control costs and spending and foster more accountable management structures. In 1986, the Efficiency Unit published the report entitled "Improving Management in Government: The Next Steps." The major recommendation of this report was the creation of smaller and independent agencies to deliver public services. This process, called "agencification," was widely implemented from the late 1980s to the late 1990s, and around 95% of civil servants worked in such agencies, which operated under a business model. In 1991, the white paper entitled "Competing for Quality: Buying Better Public Services" extended the business orientation introduced by Thatcher's government, and public services were revised.

In 1995, the white paper entitled "Resource Accounting and Budgeting in Government" moved from cash management to results-oriented management, which led to a resource-based accounting system (similar to the accrual accounting system) in 1998; the government moved from a cash-based to accrual-based budgeting system in 2001. In 1998, a multiyear and policy-oriented budget process was introduced in the UK. A public service agreement was held to set the outcomes to be reached in 3 years, and expenditure limits were established on that. This outcome orientation was replaced by output-oriented agreements, which indicated how the department intended to carry out the public service agreements. The public service agreements set performance measures to indicate clear targets that were negotiated in the budgeting process. More recently, in 2010, the Comprehensive Spending Review set out measures taken by the new government with the aim of reducing the public deficit in the UK. Important cuts were introduced in budgets of different areas (transport, business innovation, justice, home office, etc.). This document is available on www.gov.uk/.

### The USA

The USA has traditionally been characterized by a broadly business orientation, with the early incorporation of NPM ideas, such as management by objectives, downsizing, total quality management systems, benchmarking, etc. President Carter's Civil Service Reform Act in 1978 could be considered as one of the first reforms introducing a performance-related and merit pay system. Then, the Reagan administration (1980–1988) introduced several new reforms, referred to as the

President's Management Improvement Program, additionally to privatization and contracting out; for instance, the "President's Council on Integrity and Efficiency" (1981) promoted auditing and evaluation, launching civil and criminal actions and important sanctions against undesirable behaviors of civil servants. In 1982 the "Reform 88" was launched with the aim of improving financial management and accountability by introducing new information systems to reduce costs. Another relevant reform introduced by the Reagan administration in 1982 was the President's Private Sector Survey on Cost Control, commonly referred to as the "Grace Commission." The Grace Commission Report indicated that income taxes went to pay for any public services; on the contrary, all those funds were used to pay for interests of the public debt. Thus, recommendations tried to reduce program waste, correct system failure, and improve personnel management, with the aim of ending with structural deficits. The Reform 88 program and the Grace Commission Report are the Reagan administration's most well-known initiatives to improve financial management and control and auditing activities by introducing automated information systems, with the aim of strengthening accountability. The Council on Management Improvement (1984) and the President's Productivity Program (1985) were other initiatives of the Reagan administration focused on improving long-term management and productivity of agencies, department, and secretaries.

During the Bush presidency (1988–1992), not a lot of reforms were introduced; nevertheless, in 1990, the Office of Federal Financial Management was created with the aim of implementing financial management policies and reforms. Also worth noting are the management by objective systems, which allowed key governmental programs to be monitored, and the Federal Employees Pay Comparability Act, launched in 1990 with the aim of making federal and non-federal civil service salaries comparable.

With the Clinton administration (1992–2000), new reforms were carried out. In 1992 the National Performance Review was 6-month review of the federal government with the aim of making savings by making cuts across the agencies (personnel, procurements, etc.). Similarly, with the Government Performance and Results Act in 1993, the agencies of federal government had to develop a long-term strategic plan, annual performance plans, and reports on performance measurements. Cuts continued with the Federal Workforce Restructuring Act in 1994, which allowed agencies to pay separation incentives (i.e., buyouts) as inducements to leave the federal service voluntarily, resulting in the reduction of more than 272,000 full-time equivalent positions.

George W. Bush (2000–2008) focused closely on outsourcing and renewed the idea of performance and results orientation, both in budgeting and in the workforce. In 2004, a new method for evaluating the performance of federal programs was introduced, called the Program Assessment Rating Tool, which facilitated funding decisions with performance information. In addition, the workforce was moved toward a more business and entrepreneurial orientation based on performance and results. He developed e-government (*eRulemaking* in 2003) and introduced greater managerial flexibility (Freedom to Manage Act in 2003).

More recently, the Obama administration (2008–forthcoming) has not been characterized by any major reforms. Worth noting among those that have been implemented are the use of information technology to promote citizens' participation in the government and increasing transparency, the creation of cross-agency teams to solve problems and introduce changes, the reduction of improper payments and unwanted programs, and the reorganization of federal agencies to reduce overlapping activities and redundancies. Currently, the USA uses the accrual-based system to produce consolidated financial statements, but it does not use accrual accounting for budgeting.

## Conclusion

Although NPFM is a complex concept, it usually refers to reforms in budgeting, accounting, management, organization, and law, with the aim of

improving accountability – i.e., efficiency, transparency, and responsiveness in the allocation of public resources. New public funding management is a dynamic concept that evolves over time, and it depends on contextual factors (political system, demographic factors, social involvement in public affairs, legal system, etc.). In this respect, countries may learn from NPFM practices developed by their neighbors, but it is important to take into account their own characteristics and situation.

The accrual accounting system has been implemented in some countries, such as France (from 2001), Italy (from 2011), Finland (from 1998), Spain (from 2000), Australia (1994), among others. However, the accrual-based budgeting system is not usually used in Europe; here it is more common to use a mix of the cash- and accrual-based system, similar to the USA and Canada. Outsourcing, contracting out, public-private partnership, and privatization are the usual management systems introduced into public service delivery from the 1970s worldwide, taking specially relevance in New Zealand and the UK. Similarly, decentralization or devolution of power from central government to other subnational levels (municipalities, provinces, region, etc.) is also usual reforms in European countries, such as Spain, France, Germany, Italy, etc., as well as Australia and Canada. A performance orientation in budgeting systems has been introduced, which allows improved efficiency in the decision-making processes regarding the allocation of resources; and internal and external control systems were developed from the 1990s, both in terms of national offices (e.g., Italy) and independent agencies (e.g., Norway).

Restructuring financial management could be a powerful instrument when facing financial crisis, by focusing on efficiency, performance, and transparency. This leads governments to accountability, which is essential to prevent fiscal shocks. Nevertheless, reforms based on NPFM model are highly diverse, and empirical studies should investigate the consequences and real results of such reforms.

## Synonyms

Business managerialism; Collaborative governance; Performance management; Public choice theory

## Introduction

New public management (NPM) is best understood as a *conceptual framework* that draws on private-sector notions of disaggregated operations with market-based controls to produce efficient and effective outcomes in the public sector. In the briefest of quips, proponents of NPM contend that government should be run like a business (Box 1999).

In the final quarter of the twentieth century, NPM reforms swept across developed democracies in countries such as New Zealand, Australia, Great Britain, and the United States. The political prominence of these reforms, combined with resulting changes in management practice, makes it tempting to view NPM as the way the work of state gets done today. In practice, public management remains highly varied and much of the old structures of centralization and bureaucratic hierarchy remain firmly entrenched.

For these reasons, it would be a fallacy to contend either that the old "administrative state" is dead or that the new "networked state" is mere political talk without administrative substance. In complexity and contradiction, the two live side by side. Two things, however, are clear. First, NPM has garnered the attention of politicians, practitioners, and scholars alike, becoming the dominant conceptual framework used to direct, conduct, and build knowledge on the administrative business of the state. Second, this conceptual shift has produced significant implications for political and administrative theory, management practice, and public-sector scholarship.

The chapter that follows begins by overviewing two impetuses that gave rise to a new concept of public management – bureaucratic distrust and public choice theory. Next, several of NPM's operative features are presented, including business managerialism, contracting out, collaborative governance, and performance management. In the final section, special attention is paid to two important practice-based implications: NPM's capacity for achieving the triple aim of public administration (i.e., efficient, equitable, and resilient service delivery) and its ability to address the *wicked problems* of society.

While conceptualizing the administrative work of state with an NPM frame holds important and far-reaching implications, the scope and direction of this influence are far from understood, neither is it consistent nor universal. Therefore, throughout this chapter the opportunities of an NPM conceptualization are balanced with its inevitable limitations.

## Impetuses of NPM

Beginning with the advent of public management as a self-aware field (Wilson 1887), scholars tended to conceptualize its growth, shortcomings, and managerial processes in a unified way – it had grown to unimaginable proportions, was far from politically neutral, and relied upon formal rules and internal hierarchy to function (Wilson 1975; Hummel 1977). A growing sense of disillusionment that such a bureaucracy could ever realize its goals of neutrality, expertise, and efficiency signaled an opening for a new conceptual framework.

In many ways, the new framework (i.e., NPM) adopts ideals that are antithetical to the old system. An NPM framework moves away from large, discernable public agencies, preferring to engage a host of agencies – public and private – in the

delivery of public goods and services. Further, an NPM framework divests itself of the democratically derived mandate for political neutrality by expressing democracy differently, either through the provision of service options (i.e., the people "vote" with their choice) or public participation (i.e., the people "vote" through participation). Finally, an NPM framework leaves behind formality and hierarchy to stress managerial dexterity and entrepreneurialism.

These shifts represent a change in preference for how an idealized public management should operate. While any number of impetuses could be highlighted as instigating this change, two are particularly worth considering – growing distrust of bureaucracy and the political favor of public choice theory.

### Bureaucratic Distrust

Emerging from an era of corruption and mismanagement, public management throughout much of the twentieth century was decidedly modernist in nature. As such, the underlying assumption was that scientific management (i.e., Taylor 1911) of public affairs could be perfected to yield an ever-increasing prosperity for citizens. Maturing western democracies, however, were increasingly deprived of this notion as citizens witnessed time and again their governments' inability to control inflation, ease unemployment, create safe and healthy communities, care for veterans, educate the youth, and so much more.

In light of this, the words of Woodrow Wilson that so aptly acknowledged the shortcomings of public management in the pre-administrative state – "it is getting to be harder to run a constitution than to frame one" (1887, p. 200) – endured as equal indictment nearly a century later when the administrative state began showing signs of wear. Despite herculean effort by scholars, politicians, and public managers, the reforms ushered in during the decades that followed Wilson's observation ultimately did nothing to stay public critique. As the administrative state came of age, its promise lost luster and its failures became easy to recognize. The result was a wide-scale criticism of the system and a corresponding distrust toward the bureaucracy and government generally. It was – once again – time to devise a new system with new promises.

Kampen et al. (2006) explain, "One of the major purposes of the process of modernization, which has been given shape by programs such as Reinventing Government in the United States, La Rélève in Canada, and The Next Steps Program in the United Kingdom, has been to increase trust in government" (p. 388). The authors further identify the modernization effort as "mainly a social construct, barely based on a solid argumentation" (p. 388).

These lessons of history allow clearer understanding of NPM as a temporary solution to a lingering problem. The implication is that as long as the work of state leaves its citizens wanting in some manner, new managerial systems and new promises will occasionally be required. This cyclical perspective is far from cynical, however, as the alternative is a government unsympathetic to the complaints of its citizens. Additionally, this perspective does not suggest reforms are all talk and no substance, as will be seen in the next section. Instead, it suggests that important and substantive reform is iteratively possible, even while citizen contentment remains elusive.

### Public Choice Theory

A second significant impetus of NPM is public choice theory, which has a long history stretching back more than two centuries. In brief, public choice theory – or more simply, public choice – looks to apply economic concepts to political ideas (Mueller 2004). One of the more influential works on the subject was offered by James M. Buchanan and Gordon Tullock in their 1962 *The Calculus of Consent*: *Logical Foundations of Constitutional Democracy*. Two themes undergird the authors' work: methodological individualism and decentralized organizational arrangements (Marshall 2007). In methodological individualism, public choice looks to maintain a focus on the individual in the constitution of any political collective. The state, for example, is not a preexistent entity, but rather a dynamic assembly of individual actors. The second component – decentralized organizational arrangements –

looks to transform the state's service delivery by moving away from the one-agency-one-service model to a system that delivers a plurality of services governed not by bureaucratic hierarchy but by market-based controls (Ostrom 1973).

William Niskanen's *Bureaucracy and Representative Government* (1971) also merits attention in this discussion. Niskanen's work is influential due to positions of importance he held in the Kennedy and Nixon administrations and later as a principal economic architect in the Reagan administration. As an economist, Niskanen's perspective on public management stressed the *supply* side of public services. He viewed bureaucratic behavior as purposive; the administrator is – or, rather, should be – a "chooser" and "maximize" in ways similar to CEOs at profit-seeking firms, which look to align their products with consumer choice (1971, p. 5). Niskanen proposed increasing competition among bureaus. In his words, "A competitive bureaucracy would appear less orderly than the bureaucracy described by Weber but would also be less oppressive, less political, and less inefficient" (p. 201).

While the reforms of these authors were far from fully realized, their influence served to move the US federal bureaucracy – and the concept of public management generally – away from the monopolistic structures they described and toward more market-based approaches. As will be discussed below, however, one of the potential ironies of market-based reforms is that collaboration – not competition – has become a managerial ideal among politicians and practitioners alike.

## Features of NPM

This chapter has framed NPM, somewhat unconventionally, as a conceptual framework adopted as a new ideal for public-sector management. This framing is sensitive to the practice-based reality of an administrative state that is far from extinct, yet understands that conditions have indeed changed and changed in significant ways. The following sections focus on four of the more important components of this change.

### Business Managerialism

Business managerialism is grounded on the premise that management practices deemed successful in the private sector are equally applicable to the public sector. This portability of management practices thus serves as something of an indictment against traditional public management in that inefficiencies are viewed as failures to adopt proven strategies. Additionally, private-sector management assumes an esteemed position; after all, innovations in efficiency and service delivery were discovered there and need only to be replicated by an inefficient and less innovative bureaucracy.

Many of the key managerial features valued in the private sector are described throughout this chapter, including the disaggregation of service delivery through contracting, the reliance on public choice theory, and the increased utilization of performance management. Other techniques adopted to varying degrees include the removal of civil service employment protections thought to create apathetic bureaucrats; the adoption of employee incentive structures especially for top public executives; a focus on customer satisfaction; and the elusive but ever-present idea of doing more with less.

In practice, business managerialism has been a mixed bag. It would be foolish, for example, to argue that gains in efficiency and effectiveness have in no way been realized. On the other hand, decades of reform efforts have clearly demonstrated that government is not a business and trying to run it as such entails the sacrifice of other democratically held values, not the least of which is social equity. Take, for instance, the growing demand for wage equality by race, ethnicity, and sex – a concern of both public and private employers in diverse and advanced democracies. Importantly, recent scholarship finds a greater wage differential in the private sector and further notes a corresponding increase in the representation of minority citizens in public employment (Llorens et al. 2008). An empirical work such as this stands as a caution against continued and uncritical infatuation with private-sector management and further suggests that management practices in both sectors may benefit from careful imitation.

## Contracting Out

Contracting out (also known as competitive tendering, public tendering, and third-party government) is a public management practice that became fashionable in the 1980s. The practice is an operative feature of public choice theory and was imported from private-sector management. The primary intention behind contracting out for services previously delivered by public agencies is to improve efficiency and effectiveness. At times, these improvements are accomplished simply by the introduction of a private firm that is willing and able to cut costs where public agencies are prohibited from doing so. In other instances, the intention is to realize efficiency and effectiveness gains through the disaggregation of service delivery, which introduces choice and thus creates a public-sector marketplace. In short, the introduction of public tendering represents a move away from the bureaucracy in favor of the capitalist market.

In the decades since its initial introduction, a wide variety of public services have been contracted out to private and nonprofit agencies including refuge collection, health services delivery, prison management, public infrastructure maintenance, parking meter collections and maintenance, traffic enforcement, and dozens more. This makes an overall assessment of the impact of public tendering difficult. Third-party delivery of snow removal, for example, is a very different service of state than the provision of mental health care services; the two are hardly comparable.

For these reasons, when considering the impact of contracting it is worthwhile to adopt a balanced perspective. In the *Measuring the Performance of the Hollow State*, Frederickson and Frederickson (2006) aptly capture this balance: "The advantages of third-party government include flexibility, competition, and avoidance of one-size-fits-all solutions. Nevertheless, with these advantages come accountability and management challenges. A central problem of third-party government, therefore, is how to achieve its advantages without accountability deficits" (p. 21). The authors' point is well taken and represents the leading empirical need in the contracting literature. If scholars can provide meaningful guidance to practitioners concerning the instances in which contracting is advantageous, and provide guides for ensuring accountability and maintaining democratic values that stretch beyond economy, the contribution would be significant.

## Collaborative Governance

Collaborative governance is best envisioned as a two-stage public management process. The first stage aims to democratically establish administrative policy on a selected issue among a plurality of impacted and interested parties. The second stage maintains the pluralistic emphasis by involving all parties in the collective implementation of the determined policy agenda. The primary implementation aims stress collaboration (i.e., a coordinated effort that is noncompetitive and nonduplicative) and results (i.e., an impact that is synergistic).

Recently, a subliterature on collaborative governance has emerged to significant practitioner appeal. "Collective impact," as termed by Kania and Kramer (2011), involves a set of five conditions, emphasized in the quote below:

> Collective impact initiatives are long-term commitments by a group of important actors from different sectors to *a common agenda* for solving a specific social problem. Their actions are supported by a *shared measurement system*, *mutually reinforcing activities*, *ongoing communication*, and are staffed by an independent *backbone organization*. (p. 39, italics added)

In the short time since Kania and Kramer first published on the topic, collective impact has developed a growing literature among scholars and has been replicated countless times among practitioners, especially in the United States and Canada. Collective impact has also garnered federal endorsement in the United States, having been incorporated as a required activity in multiple grant awards and contracts. For example, the Health Resources and Services Administration described and required collective impact in its most recent Healthy Start grant announcement, an initiative that provides approximately $100 million to 100 communities nationwide to address inequitable birth outcomes. Despite its instant popularity, the evidence concerning collective

impact is scant at best (i.e., a variety of case studies that depict preliminary progress). In large measure, this is due to the ambitious nature of collective impact initiatives such as the one described just above (i.e., reversing the centuries' old inequity in US birth outcomes).

In addition to the need for evaluative work, the growing popularity of collaborative governance modes (including collective impact) also raises a need for empirical efforts that explore issues of substantive democracy versus procedural democracy (e.g., Box et al. 2001). Of particular concern is the question of administrative policy enfranchisement. In other words, who gets included in collaborative governance and is thereby allowed to play a role in the creation and implementation of administrative policy? And perhaps, more importantly, who is left out?

Thus far, the extant literature on collaborative governance has demonstrated ambivalence when considering policy implications such as these (see Sørensen 2002 for a thorough treatment). Certainly collaborative governance – and NPM generally – resurfaces the question of a politics/administration dichotomy. The best articulation of this question in a contemporary context might be: *how concerned should we be that western democracies, under the influence of public management practice, continue their slide away from the founding ideal of representationalism*?

The argument is easily made that when private-sector actors conduct portions of the state's business, the absence of democratic control becomes even more problematic than it was in the administrative state – *the principal-agent problem*. On the other hand, when administrators tear down the old bureaucratic model of centralization and begin to conduct business in partnership with a plurality of community partners, a new democratic politics becomes possible. These questions are not easily resolved. To be sure, collaborative governance comprises a key area for scholars' attention in the coming years.

## Performance Management

Broadly conceived, performance management shifts the expectations placed upon employees, units, and agencies away from simple task completion and toward the accomplishment of larger and measurable outcomes. It involves the conscious and often collective effort of creating an agency strategic plan that explicates the agency's mission, links that mission to selected goals, and then proceeds to articulate a series of measurable and time-phased objectives, which identify responsible parties, required resources, and indicators of success. When done as intended, performance management is totalizing within public agencies; it impacts everyone and justifies every task.

Performance management asks all employees within a public agency to think beyond the limits of their assignments in an effort to grasp the larger significance of the agency's work. In this way it pushes back on the bounded rationality (Simon 1957) that stood as a hallmark of administrative theory in the former system. Further, it undermines the hierarchical authority that was granted by position in the old system. Instead, performance management privileges the authority of established indicators of performance. So while positional authority remains in the new system, it is kept in check by adopted indicators of success.

Hughes (2003) makes the important point that performance management, along with the dependent concepts of personnel and financial management, comprises the internally focused aspects of NPM. Given that the vast majority of NPM is externally focused (e.g., contracting out, collaborative governance, etc.), performance management reforms represent an important area of study for understanding contemporary bureaucratic practice. Interestingly, Hughes notes an almost total absence of performance management prior to NPM and offers indication about why this had been the case: "an administrator [did] not need to worry about performance as all he or she is doing is carrying out instructions, and performance measurement is the problem of those giving the instructions" (p. 157). Not surprisingly then, performance management steps back not only from the bounded rationality espoused by Simon but also from his normative call for bureaucratic neutrality. The new public management, rather boldly, enacts policy; it places *value* on

managerial practice that is characterized by vision and goal setting.

## Implications of NPM

As discussed above, the changes brought about by NPM reforms hold important and manifold implications for representative democracies and the services they deliver. In this final section, attention is focused on two specific implications that merit fuller consideration.

### Efficient, Equitable, and Resilient Administration

Given the conceptual dominance of NPM, it is worth considering whether, as Hood asked in 1991, NPM is a public management for all seasons. Scholars (e.g., Heinrich 2010; Smith 2008, etc.) commonly cite Hood's 1991 article as the first to explicitly address and name new public management. In the article, Hood first reviews the origins and characteristics of NPM. He then turns to a discussion of the viability of administrative values (i.e., economy and parsimony, honesty and fairness, and security and resilience) in an NPM context. If NPM is a management for all seasons, Hood argues, it should be equally capable of addressing each of the three values.

Despite a range of characteristics, Hood's view is that marketization is at the core of NPM, and as such, it is principally designed for the first of the administrative values (i.e., economy and parsimony). Hood, therefore, concedes, "If NPM is a design for putting frugality at centre state, it may at the limit be less capable of ensuring honesty and resilience in public administration" (p. 15). Despite his concession, Hood closes the article on an optimistic note, indicating that the frugality sought in NPM does not by obligation come at the expense of the other values. Only time and empirical attention will bear this out.

A quarter of a century later, Hood's landmark article raises twin questions: *so what have we learned*? *Is NPM a management for all seasons*? Not surprisingly, comprehensive analysis of NPM's impacts upon these core values is difficult to find. Among the foremost empiricists are Kenneth Meier and Laurence O'Toole. Their article "The Proverbs of New Public Management" draws on a collective research agenda that spans more than a dozen studies and nearly two decades to "determine what actually works in [public management] practice" (2009, p. 4).

Taking a play from Herbert Simon's book, Meier and O'Toole examine ten proverbs of public management. In each case, a proverb (i.e., what is commonly accepted in the field concerning NPM) is contrasted with what they have found in their research. For example, contracting out, as the proverb goes, improves efficiency and performance (i.e., the administrative value of economy). In their research, however, Meier and O'Toole have noted only an association between contracting out and larger central office bureaucracies. The authors wisely conclude here that "managers have multiple goals when contracting out, and knowing what these goals are, rather than assuming an exclusive or paramount desire for efficiency, is important" (p. 9).

As a second example specific to the value of equity, Meier and O'Toole put forward the proverb that "good management benefits everyone" (p. 10). Here again, however, the authors find that "management effort has distributional consequences and affects some of the organization's clientele more than others" (p. 10). Not surprisingly, who benefits is determined by the type of managerial effort implemented; an increase in specialty services is likely to aid the *haves*, while an increase in safety-net services is likely to aid the *have-nots*.

Interestingly, the administrative value of resiliency is missing from the list of NPM proverbs. Perhaps this suggests that the primacy of economy in an NPM conceptual framework has eroded the antithetical value of resiliency to the point of extinction. Certainly, the call for a public administration that is resilient, even incorporating certain redundancies, is absent from today's expressed values.

The collective work of Meier and O'Toole provides little to no positive support for Hood's inquiry about a management for all seasons. Said simply, NPM has not proven to be inherently efficient, equitable, or resilient. That is not to say

NPM cannot be these things, but as the authors summarize, many portions of conventional NPM wisdom constitute little more than "misleading or proverbial assertions" (p. 18).

Given this, attention should perhaps be turned toward the values that are being derived from NPM. Is NPM, for example, an advancing society beyond the most entrenched problems of modern democratic states? Is it aiding administrators in addressing the so-called *wicked problems*?

## Wicked Problems

In a 1973 article – "Dilemmas in a General Theory of Planning" – Rittel and Webber introduced the idea of *wicked problems*, a concept that scholars have since used as a social reality that demands a new public management (see, e.g., O'Toole 1997; Isett et al. 2011). Rittel and Webber had this to say:

> The search for scientific bases for confronting problems of social policy is bound to fail, because of the nature of these problems. They are "wicked" problems, whereas science has developed to deal with "tame" problems. Policy problems cannot be definitively described. Moreover, in a pluralistic society there is nothing like the undisputable public good; there is no objective definition of equity; policies that respond to social problems cannot be meaningfully correct or false; and it makes no sense to talk about "optimal solutions" to social problems unless severe qualifications are imposed first. Even worse, there are no "solutions" in the sense of definitive and objective answers. (p. 155)

The assessment offered by Rittel and Webber remains consistent throughout the article: solutions are not advanced; rather, social complexities that challenge public management are thoroughly – and dauntingly – enumerated. In addition to the compelling nomenclature of *wicked problems*, Rittel and Webber seem to have hit on two important truisms of public management in advanced democracies: (1) the low-hanging fruit accessible via scientific management has all been harvested and (2) the challenges that remain are amorphous, nonuniversal, epistemologically arbitrary, and without definitive solution.

Forty years of intervening history have added significant credibility to the argument of Rittel and Webber. These decades have borne witness to inertia vis-à-vis the *wicked problems* that were so aptly described by the authors. Take as just one example the social equity issue mentioned earlier in this chapter of disparities in birth outcomes. Mary White Ovington (1911) records New York City's Black infant mortality rate in 1908, at 290 deaths for every 1,000 live births. The most recent data from the Centers for Disease Control and Prevention (CDC) reveals that rate at just 7.6 (CDC Wonder). An astonishing 282 babies are now saved for every 1,000 born. And yet, Ovington notes the White rate in 1908 as 127.7 for every 1,000 live births. Today that rate is a mere 2.35.

These numbers reveal a concerning social reality predicted by Rittel and Webber. The application of a scientific approach to public health practice improved both rates remarkably while leaving the disparity intact. In fact, the disparity ratio has increased from about two-fold to about three-fold in this premier American city. Sufficed to say, the disparity in infant mortality witnessed by Ovington in 1908 New York proved to be a *wicked problem* for which we still lack a solution.

The question raised in considerations such as these is whether NPM as a conceptual guide for administrative practice has failed or simply needs more time. If we discarded the administrative state due in large measure to its inability to address society's *wicked problems*, but have reaped no benefits in this regard, how vehement should be the indictment?

As was suggested at the outset of this chapter, the answer to this question is provided intersubjectively. In other words, when – on the balance – citizens and practitioners, scholars and politicians, collectively determine that a new framework is needed, the dismantling of NPM will begin. For the time being, the continued appeal for the operative features of NPM discussed above suggests this time is yet far off. Additionally, the instant popularity of an approach like collective impact lends further support to a distant NPM time horizon. It suggests that practitioners remain hopeful about realizing progress in relation to society's *wicked problems*. It further suggests that citizens are willing to engage with public managers in that process and that scholars continue to have a role to

play in seeking and articulating a clearer understanding and a more effective way forward.

## Conclusion

Throughout this chapter, NPM has been presented as a conceptual framework for contemporary public management practice. Additionally, effort has been made to provide a balanced perspective concerning the opportunities and limitations of this framework. This treatment has demonstrated – both from academic and practice perspectives – that NPM remains young, unanswered question abounds, new facets of practice continue to emerge, and the promise of progress remains intact.

While NPM initially came to the fore in a context of bureaucratic distrust and the allure of new ideas such as public choice, the reality of its implementation demonstrates that no easy solutions exist for the administration of state services. Society is simply too complex and its citizenry is unlikely to remain satisfied with any framework indefinitely. Nevertheless, NPM – at its best – demonstrates the adaptability of democracy. It stands as evidence that democratic societies are indeed attuned to the voice of their citizens and capable of responding with new ideas. They are willing to experiment in the hopes of striking upon a better way.

## New Public Management (NPM) Framework, Fiji Correction Services

Gaurav Shukla[1], Peni Sikivou[2] and Auta Moceisuva[2]
[1]Law, School of Law and Social Science (SoLaSS), University of South Pacific, Central Division, Suva, Fiji
[2]Department of Management, Fiji National University, Central Division, Suva, Fiji

### Synonyms

Contracting out of public services; Customer orientation in the public service; Performance management; Privatization; Public service reforms

### Definition

The New Public Management approach determines the introduction of market-like relationships between service providers themselves as with service users and the introduction of market-based incentives and reward mechanisms for public professionals and in the delivery of public services.

### Introduction: The Theoretical Framework

The New Public Management (NPM) Theory draws its existence from neo-liberal ideas of the 1980s from the United States and the United Kingdom under the theory of public choice. Fiji's public service reforms were adopted in the early 1990s as part of a broader shift in the development policy towards private sector-led and export-oriented growth strategy (Government of Fiji 1993). Part of this policy focused on the implementation of the NPM principles in all government ministries and departments.

The effectiveness of the application of the NPM attributes in the management and operations of Fiji's Correction Service given the recent implementation of the reforms (Fiji Correction Service 2017) has not been subject to any research. Consequently, the aim is to establish whether there is a need for continued and augmented implementation of the NPM principles in the management of Fiji's Correction Service or a change in modality of reforms.

#### Theoretical Framework

The NPM emerged to replace the traditional model of public management in the 1980s and 1990s in response to the inadequacies of the traditional models (Hughes 2003). The NPM paradigm encourages the introduction of market-like relationships between service providers themselves as with service users and the introduction of market-based incentives and reward mechanisms for public professionals.

### The NPM Theory

Governance and public services efforts in many developing countries have continued to adopt the centralized, bureaucratic model of public administration, countries from the early twentieth century to the 1970s (Robinson 2015). However, in the 1980s and 1990s, the NPM paradigm which proposed the adoption of the private sector and market-based disciplines in organizational management was introduced as an integral part of public policy (Islam 2015).

The adoption of the NPM paradigm in the reforms of public service management is the process of streamlining the Government bureaucracy through various measures (Perante-Calina 2019). This includes reengineering, reorganizing, and rationalizing organizations as the underlying conceptual rationale of these measures. Public service reforms aimed to achieve the principles of economy, efficiency, and effectiveness, transparency, social growth, innovation, and good governance.

Jauhiainen further identifies the key aspects of the NPM Theory as an increased emphasis on customer focus in the provision of public services and market-based conditioning frameworks consisting of privatization, competition, and contracting out (Jauhiainen 2009).

Re-engineering of the public service was advanced as a strategy to re-visualize and redesign an organization's core work processes to accomplish significant and rapid improvements in operating and support costs, service levels, and cycle or work completion time, product and quality innovation, and employee responsibilities for service and organizational goals (Hale and Hyde 1994). In some countries, the adoption of public sector reorganization emphasized deliberate changes to the structure and processes of public sector organizations intending to get them to run better (Pollitt and Bouckaert 2011).

Some countries such as Kenya, Rwanda, Trinidad, and Tobago, and Seychelles, however, have adopted public sector rationalization programs by prioritizing vital roles and functions and eliminating lower priority activities (Commonwealth Secretariat 2016). Removing overlap of functions between ministries and departments as the basis of improving operational efficiency was a major policy objective. The Organization for Economic Co-operation and Development (hereinafter OECD) in 2001 in their report, "Managing Public Expenditure, a Reference Book for Transitional Countries," explains that the reforms aim to reallocate resources generated towards the delivery of the Government's core or priority activities, as an increasing number of people are demanding better public services and more value for their tax funds. The existence of inefficiency might suggest that public service resources could be better used elsewhere in the economy or that more outputs could be generated within the public services without additional resources (Smith and Street 2005).

The NPM (or Public Service Reforms) has also been principally founded under the theories of Property Rights, Principal-Agent relationship, and Public Choice. The Public Choice Theory argues that private ownership is generally interested in the financial performance of the firm, whereas, in public ownership, the appropriate specification of objectives is less clear (Yarrow and Jasinski 1996). This non-clarity in objectives often results in ambiguity in the delivery of services. The theory of Public Choice emphasizes the importance of markets and customers' viewpoint of the government as a key determinant of success. Public servants need continuous supervision and monitoring to enhance their service delivery and achieve efficiency, stem corruptive behavior, and respond to citizens' needs (Curristine et al. 2007). The theory assumes that public officials will be motivated to serve by virtue of a commitment to the public interest and will respond to citizens' expectations of a healthy and responsive public service (Osborne 2006; and Denhardt and Denhardt 2011). However, in many circumstances, as it is observed by the researchers that public officials are driven by monetary incentives rather than a commitment to public service.

The Principal-Agent Theory asserts that private ownership is more efficient, as it often provides a more effective method of control and assures a greater degree of internal efficiency. Line ministries or departments (the agents) can be seen as agents of the Ministry of Finance (the principal) because they are required to produce a certain level of public output – including the quality of this output – in exchange for their budget appropriation (Leruth and Paul 2007). In respect to the Principle Agent theory, the inclination of strict liability persists and determination of what work should be done and how that work is to be done is the primary aspect of the theory.

The Principal-Agent theory was developed for the private sector to explain the divergence often found between the goals of managers (agents) in private firms and shareholders (principals) (Kalimullah et al. 2012). They note that principal-agent theory attempts to find incentive schemes for agents to act in the interests of principals, while agents should have contracts that specify their obligations and rights, in addition, to ensure their behavior complies with the wishes of the principals. The theory gives some backing to those arguing for contracting-out as much of the public sector as possible.

Greater customer satisfaction and more choice are achieved because public sector organizations provide worse services than the private ones, one, due to the lack of competition, and because, the need to make a profit means that public sector organizations have no incentive to be responsive to their customers (Brittan 1996). Adding to this discussion by stressing that the New Public Management paradigm is not just the implementation of new techniques, it carries with it a new set of values, specifically a set of values largely drawn from the private sector and the adoption of practices, ranging from scientific management to total quality management that has been found useful in the private sector (Denhardt and Denhardt 2011). The NPM philosophy suggests that the government should not only adopt the techniques of business administration but should adopt certain business values as well (Robinson 2015).

The inadequacies and inefficient practices of governments became a critical rationale for the adoption of NPM principles and reforms in several African States. Programs of political, institutional, and economic reforms were introduced to change the role of government, create an enabling environment for the private sector and civil society to flourish, and establish an effective civil service by increasing its competence, efficiency, fairness, and quality of services (Commonwealth Secretariat 2016). The Commonwealth Association for Public Administration and Management (2015) highlights that, in principle, key reform measures in Africa, encapsulated under the banner of structural adjustment programs (SAPs), entailed the process of "agencification" (i.e., the creation of semi-autonomous executive agencies), decentralization, commercialization, and privatization have their roots in this theory.

Numerous research has been conducted to assess the quality of public service. In particular, the emphasis was on the strategy of cutting through red tape and minimizing public waste and value-for-money have been predominantly important drivers for the introduction of performance measurement in the public sector (Greiling 2006). Both the red tape and performance constructs are multidimensional and results show that different types of red tape have varying impacts on governmental performance but these effects are somewhat weaker than public management theory and conventional wisdom suggest (Brewer 2010).

Measuring public service relative to private sector efficiency has been a daunting task, due to the multidimensional characteristic of the aspect of service, in being heterogeneous, perishable, intangible, and variable. Unlike the private sector firms, public sector organization's objectives are not only economic oriented but also focuses on social priorities.

## Key Elements of NPM

To clearly understand the application of the NPM theory in public service reforms, it is essential to determine what it constitutes. The organization structure in the context of NPM in hierarchical bureaucracies is the sum total of rules and regulations and is the recognizable form of authority to which people submit themselves (Murray et al. 2006).

One of the core elements of the NPM paradigm is the disaggregation of organizational structures by means of breaking up large government monoliths, as well as a separation of functions therein, to make government units manageable. Autonomy and liberating managers from rules and restrictions have been seen as an added benefit of such disaggregation (Van de Walle and Groeneveld 2016). Van de Walle and Groeneveld argues that moving to such smaller, single-purpose bodies would make government simpler and more transparent and facilitate government management of these bodies; however, disaggregation created fragmentation calls for coordination across the disaggregated units, not only within government but also beyond the public sector (Van de Walle and Groeneveld 2016).

The NPM paradigm further advocates the process of decentralization and delegation of management authority. Decentralizing management authority within public agencies-giving top management freedom to manage with clear responsibility and reducing the management role of the center-constitutes a key element of the NPM paradigm (Larbi 1999). Public managers are free to

manage their units in order to achieve the most efficient output (Hood 1991).

Another key component of NPM is output orientation or performance management. The key elements of the NPM comprise a focus of management systems and management effort from inputs and processes to outputs and outcomes (Pollitt 2001). Pollitt adds that a key element of the NPM theory is the greater measurement of performance through the identification of key performance indicators. Performance management or results-based management states that it typically involves several phases, mainly articulating and agreeing on objectives, selecting indicators and setting targets, monitoring performance (collecting data on results), and analyzing and reporting those results relative to performance targets (Binnendijk 2000). Performance management measures productivity which is the output produced per unit of input as the conventional definition.

The inputs include money, technical expertise, relationships, and personnel activities that include hiring staff, purchasing equipment, constructing prisons or other facilities, commissioning legal guidelines, and providing other forms of technical assistance (Parsons et al. 2013). They add that output as being the tangible and intangible products that result from project activities and that outcomes are the benefits that a project or intervention is designed to deliver. In this context, impacts comprise the higher-level goals to which one hopes a project will contribute towards, such as increased access to justice for the poor or improvements in public safety (Parsons et al. 2013). If performance is not monitored, assessed, and responded to accordingly, perverse incentives can creep into the public sector culture (Hassall 2018).

With the implementation of performance management systems, managers may be tempted to increase the return by reducing training expenditure or shifting costs elsewhere in the organization (Heath 2019). He argues that there may be considerable subjectivity in interpreting many aspects of performance, especially as indicators of inputs or throughputs often have to be used as proxies for indicators of outcome (Heath 2019).

The NPM paradigm has involved the introduction of term contracts, performance-related pay, and local determination of pay and conditions, which is a shift away from permanent tenure. Supporters of the NPM model emphasize the importance of flexibility and measuring performance and quantifying results. Staff reductions have been practiced to save costs but at the same time, greater workloads have been experienced by the remaining workers.

The NPM theory is centered on a preference for more specialized and autonomous organizational forms, the widespread substitution of contract or contract-like relationships for hierarchical relationships, the use of market or market-like mechanisms for the delivery of public services including privatization, and contracting out and the development of internal markets (Pollitt 2001). A shift towards a contractual agreement in the public service is a critical aspect of the NPM framework (Hughes 2003).

As earlier discussed, disaggregation creates specialized and autonomous organizational management setups. This has necessitated the institution of contract-like relationships to increase competition and improve the operation of government services (Robinson 2015). Contracting out of services or management responsibility involves private service providers competitively bidding to provide services previously under the public domain. Many governments have opted to contract out or outsource services in order to reduce cost, access scarce expertise or skills not available in-house to meet on-off needs of government ministries or departments, and replace government operations in cases whether their operations have been deemed to be unsatisfactory (Blondal 2005). In essence, contracting has been used to achieve a greater quality of services at a lower cost.

Contracting outdraws its theoretical base from the purchaser-provider split (PPS) theory, which is defined as an arrangement that separates "the purchaser," as the agent who decides what will be produced, from "the provider," as the agent who delivers the agreed outputs or outcomes (Ryan et al. 2000). Competitive tendering for service delivery contracts has become an integral part of

the purchaser-provider split which, in turn, is part of the reinventing government (Osborne and Gaebler 1993). Bailey and Davidson (1999) indicate that there is now a substantial body of evidence (reviewed in Bailey 1995) that the purchaser-provider split has engendered increased efficiency on the part of service providers in terms of reducing the costs of service provision.

The purchaser-provider split involves the separation of the demand for and supply of services, which is different from the traditional service model whereby the government or the public sector provides services. The purchasers supposedly act on behalf of service users, concentrating on identifying the need for service (Bailey and Davidson 1999). Bailey and Davidson further add that the purchaser specifies the service to be delivered by the provider within a fixed budget (Bailey and Davidson 1999). They note that although this process implies a formal contracting regime, the purchaser-provider split does not necessarily introduce or require contestability for contracts to provide services. As such, non-competitive contracting regimes may be used where there are fears that the organization winning the contract may face such severe financial pressures that they reduce quality and/or levels of service in order to cut costs (Bailey and Davidson 1999). While contracting out of public service has proven to have reduced costs and improved quality of service delivery, it can be problematic due to the absence of necessary laws and contract enforcement which are often not well established in developing countries.

One implication of reforms has been the overriding emphasis on customers. Over the years, increasing emphasis has focused on improving service quality and responsiveness to customers. This has brought with it pressure for better quality public services, from service users as their needs change and their expectations rise in respect of how well services can be performed (Flynn 1995).

Alford in 2002 distinguishes customer service in the private and public sectors (Alford 2002). He notes that private industry customer expresses a preference among alternatives, pays for that goods and services, consumes the good and services, and derives value from using or enjoying it. In the public sector, the expression of preference, payment, and consumption and the value derived is asymmetrically divided between the government (as elected by the citizenry), the citizenry who derives public value, and the consumer who derives private value.

The ability to meet customer expectations is a key objective of customer service. Customer service is based on the concept that the organization will reach its goals effectively and efficiently through the satisfaction of the customer (Wagenheim and Reurink 1991). Wagenheim and Reurink add that with this orientation of identifying, understanding, and focusing on customer needs, processes are designed to satisfy customer expectations. They state that once the processes are designed, it is often necessary for the management to implement changes that will support performance and if customers want rapid decision-making, then empowerment or participatory management may be required. Wagenheim and Reurink conclude that although each customer is unique, there are common expectations, which include communication, information, responsiveness, and problem resolution, and on-time, reliable, consistent service delivery.

## NPM Principles and the Correction Service of Developed Countries

The NPM framework has been implemented in numerous Correctional Services in developed countries. Historically, however, experiences of Correctional Services have focused on building prisons, managing prisons, and supplying services to inmates. The rationale for choosing developed countries in this analysis is twofold: one, most of the advancement in the application of NPM principles in correction services has occurred in developed countries, particularly, the UK, Australia, and the United States, and two, the principles of NPM have evolved from Westernized developed countries. Correction Services in Scotland, England, and Wales were part of efforts by the British public service to improve operational efficiency. However, experiences have varied in view of the

uniqueness of the services and statutory responsibilities of Correctional Departments or Agencies.

A key element of the reform was a concerted shift towards strategic and business planning. The business planning process of holding Prison Service Governors to account for delivering specified outputs began in the late 1980s with an emphasis on setting corporate objectives for each establishment in the UK (Fittall 1989). The development of corporate objectives at the establishment level, together with the collection of quantifiable information on the actual delivery against those objectives, gave Governors and importantly, their line managers' performance information on the delivery of selected activities for the first time (Bryans 2005).

The completed business plan showed the performance that had been achieved and formed the annual report for the establishment (Bryans 2005). Governors were no longer able to produce subjective and anecdotal reports of the activities of their establishments, which had been the norm previously. The NPM framework has had a profound impact on the dimensions of prison policy discourse and operations of the Scotland Prisons Services (Sangkhanate 2011).

Her Majesty's Prison service adopted reforms involving the devolution of powers to Prison Governors in the key areas of finance, personnel, and prison regime giving Governors the freedom to manage prisoner work at their prisons and respond flexibly to changing needs and demands (Bryans 2005). Bryan adds that with increased control over budgets came greater accountability for ensuring that the budget was not exceeded and an expectation that efficiency savings would be delivered. The devolution of responsibility for personnel matters also had a major positive impact on Governors' work as they found themselves dealing directly with staff recruitment, selection, and discipline which historically had been the responsibility of Headquarters or regional office.

Bryan notes that a decision was taken in 1991 to restructure the management of Governors in HM Prison Services, with the creation of geographical groupings of nine or 10 establishments under 15 area managers. He reported that these changes fundamentally changed the way Governors were managed as, for the first time, Governors were closely monitored and supervised, contributing positively to increased accountability. There was some sensitivity over the impact that the area managers would have on Governors, which led the Service to make clear that strengthening management should not be seen as a threat to the position of the governor as the person in charge of the establishments (HM Prison Service 1989).

In 2011 Sangkhanate reviewed prison policy in the Scotland Prison Service and found that it had extended its operational focus from traditional concepts such as control, deterrence, and rehabilitation, to effectiveness, efficiency, and value for money. On the specific dimension of operations, Scotland Prison Services adopted a "business-like" approach in the management of the Scotland Prison Services by delegating powers from headquarters to prison governors, using contractual management to manage both public and private prisons, contracting out prison transportation and prison services, and promoting customer service orientation. NPM has changed the way public prisons are managed by bringing in managerial mechanisms borrowed from the private sector.

It is worthy to note that Beard in 2019 had observed that Her Majesty's Prison and Probation Service was expressing concerns regarding the quality of service being provided by facility management companies, and its most recent annual report states that it has taken action to strengthen facilities management contract management arrangement. The UK Government expressed concern about the prison service maintenance contracts not having delivered the savings they had anticipated owing to an underestimation of historical costs (Beard 2019).

The Director-General of Her Majesty's Prison Services in the UK expressed improved performance following the introduction of key performance targets in business plans (Bryans 2005). On the downside, the Key Performance Indicators failed to measure qualitative aspects of prison services such as justice and fairness. Her Majesty's Prison Services KPIs were centered on process and outputs rather than outcomes – as they were more about the number of offending

behavior places and education qualifications rather than reconviction rates and crime reduction. He adds that Governors believed that the approach adopted by the Prison Service is increasingly about measuring processes rather than outcomes. Bryan further indicates that there has been a lack of evidence of NPM reforms influencing significant improvement in social outcomes and that there has been no reduction in reconviction rates in the period since NPM tools, approaches, and systems in Her Majesty's Prison Services before 2005.

The Scotland Prison Service (SPS) has been adopting performance management over the years. Each year, the SPS produces an Annual Delivery Plan (ADP) which sets out how they will deliver their strategic outcomes and key aims. The SPS's ADP is underpinned by a robust annual business planning process and contains the specific actions and activities that require to be undertaken (Scottish Prison Service 2019).

On organization structure, Bryans's study revealed that Her Majesty's Prison Service responded to the large-scale organizational failure by opting for a more cohesive and integrated service organization, adopting managerial tools. Managerialism became synonymous with the demise of Governors' organizational power and a clear shift in power from Governors to the center (defined as Headquarters and its field representatives and the area managers). However, the Scotland Prison service reflected a desire to create a management structure that promoted cooperation and teamwork. Also, the managerial structure of the organization was established to ensure internal accountability (Sangkhanate 2011).

Correction Services worldwide are required to adhere to international human rights standards for accommodation in prison. The UN Standard Minimum Rules for the Treatment of Prisoners expect prisoners' accommodation to be clean, well ventilated, well spaced, and having single-occupancy cells. It was not until April 1994 that Her Majesty's Prison Services established Minimum Operating Standards for prisons in England and Wales, making Governors personally accountable for their establishments' achieving these defined standards (Bryans 2005). Standards were set initially for security and later for all aspects of the prison regime. Standards have since covered everything from accommodation and hygiene to industrial relations and regimes (Leech and Shepherd 2003, and HM Prison Service 2000). The establishment of standards illustrates the emphasis on customer care as advocated in the NPM theory. Despite these standards, it has been reported by Her Majesty's Inspectorate of Prisons in 2017 that prison conditions in England and Wales have worsened, with many prisoners spending 22 hours a day in their cells, which are often cramped and have poor hygiene standards.

In 2019, the Auditor-General for Scotland reported that managing high prisoner numbers, where many have increasingly complex care needs, with high staff absence, creates a high-risk environment and reduces the support that can be provided to prisoners. The Auditor-General for Scotland concludes that there has been a rise in prisoner numbers, increasing costs, growing violence between inmates and against prison officers, and delays in upgrading the prison estate. This means that existing prisons are less able to provide a modern prison service and are at higher risk of failure and the financial pressures on SPS are also compromising efforts to equip and support prisoners for life outside prison.

## Summary of Literature Review

The brief review of the application of NPM principles in Correctional Services in Scotland, Wales, and England reveals mixed results in relation to the adoption of NPM attributes. The Scotland Prison Service showed the NPM having a profound impact on the dimensions of prison policy discourse and operations. Scotland Prison Service expressed improved performance following the introduction of key performance targets in their business plan. In England and Wales Prison Services, their Key Performance Indicators (KPIs) failed to measure qualitative aspects of prison services. Moreover, both prison services showed improvement as Governors were no longer able to produce subjective and anecdotal reports of the activities of their establishments. The downside,

however, was that both prison Services increasingly measured process rather than outcomes with no reduction in reconviction rates. The devolution of responsibilities augured well for Governors in England and Wales as they were given the freedom to provide and manage prisoner's work at their prisons.

## The NPM Components and Fiji's Correction Services

There are 12 prison institutions in Fiji spread throughout the four main Divisions while the total manpower comprises 1000 prison officers against a daily average prison population of 1000 prisoners. In view of the statutory responsibility of the Fiji Correction Service as entrenched in Fiji's 2013 Constitution, the review of the application of the NPM components in the Fiji Correction Service will be confined to five NPM key attributes as highlighted in the diagram below:

Under the provisions of the Prisons & Corrections Act 2003, the core functions of the Fiji Corrections Service are two-pronged, to provide safe, secure, and humane treatment of inmates and to provide realistic and meaningful training and rehabilitation program to better the chance of inmate's reintegration back to the community upon release from the prison institutions.

The provision of safe, secure, and humane treatment of inmates, in the broader sense of the policy, warranted that inmates must be securely contained at all times. First, in compliance with international best practices, the prison infrastructure layout should be designed to prevent any effort by inmates to escape from custody. Second, when movement outside the prison does occur, the safety of the prisoners should be the priority duty of prison officers.

The safety and security of inmates, therefore, have presented enormous pressure upon the FCS because the public expectation is that despite the progress realized in other areas of prisoner rehabilitation, all successes are negated when an inmate escapes. Secondary information from the last 5 years shows that escape has occurred despite strengthened efforts directed towards improving infrastructures and outside movements to work, hospitals, and courts. In 2012, a total of five prisoners escaped from the Naboro Corrections Facility (Pacific Islands Report 2012). On 24 December 2018, seven (7) prisoners escaped from Naboro Corrections Facility (Fiji Broadcasting Commission 2019). In this respect, it can be

**New Public Management (NPM) Framework, Fiji Correction Services, Fig. 1** NPM Five Key Elements. (Source: Lapuente and Van de Walle, 2020)

ascertained that the tangibles (infrastructure) aspects in the delivery of FCS have been a significant challenge. The US Human Rights Report of 2018 reveals that Fiji prisons were somewhat overcrowded, holding 1,423 inmates in facilities intended for 1,000. The Report further reveals that Fiji's Prison facilities were not suited to inmates with physical and mental disabilities. Most of FCS's prisons were built in the 1950s and have remained the same despite an increase in prison population and prisoners to prison officer ratios.

In line with the overall commitment by the Fiji Government to reforms, the FCS has also implemented other key elements of the NPM theory. US Human Rights Report of 2018 confirmed that authorities generally separated pretrial detainees and convicted prisoners at shared facilities, although in some cases authorities held them together. Typically, Fiji's inmates undergo a rehabilitation program that targets behavioral and life skills in the form of numeracy and vocational training. These objectives of incarceration aim to change the inmates offending behavior and advance options for meaningful employment and useful citizens upon release.

There have been incremental changes taking place within the Fiji prison institutions over the past decade particularly after the introduction of the Prisons & Corrections Act 2003. These changes were brought about after carrying out consultations with the various international and local expertise to carry out the reviews in order to improve the efficiency and effectiveness of service. The Bale Report (1980) was commissioned to examine the problems that culminated in the prison riots of Korovou Prison in 1979.

In 2003, the then Fiji Prisons Service adopted the Prisons & Corrections Act 2006 which marked the point of departure from an old regime preoccupied with the traditional penological philosophy of containment to another which emphasizes improved service delivery, state-of-the-art prisons infrastructure, physical and dynamic security, rehabilitation program and staff training among the key changes captured in the new policy. This provided the impetus to build formidable foundations for an effective and effective sustainable modality for contemporary prison management.

Along with internal structural changes in the prisons, a parallel reform agenda was being led by the Fiji Public Service reform since 1993 bringing to the forefront the adoption of NPM principles. This particular reform has vastly impacted and leveraged the level of professionalism and sufficiently equipped staff members with modern management tools to empower the staff to achieve the desired results. Building on these reports and through the advent of the Prisons & Corrections Act 2003, there have been tangible impacts attained in 2007 through the implementation of the Yellow Ribbon Project in partnership with the Singapore Prisons Services. The changes have greatly improved the organization's outlook from the lens of the public domain proving that Fiji's Correction Service regime has steered Fiji's prison system towards the international benchmark of best practices compliance with the UN Minimum standard rules for the treatment of offenders. Such a change in focus reveals that FCS's customer orientation focus as a key component of the NPM framework has had some improvement.

The Public Reform Reforms and Fiji Prison reform both supported the devolution of powers from the Commissioner to senior managers to exercise authority in the areas of their responsibilities (The Prison Act 2003). This delegation was intended to ensure the smooth flow of operations as opposed to a centralized system requiring the Commissioner to make decisions on all matters relating to daily prison management. Despite this statutory provision on delegation of authority, all powers delegated to the Supervisors and Officers in Charge have been withdrawn and reverted to the Commissioner creating numerous operational challenges (Section 130 Constitution of Fiji 2013), for example, staff rostering, prison routine, the internal disciplinary mechanism for the staff among other policies which have been reverted as a result of the centralization of power. Staff discipline which previously used to be dealt with by senior officers as consistent with the Prisons Act 2006 has now changed so that all cases must be referred to the Commissioner.

Employment conditions concerning appointments, retention, and termination for the

subordinate, junior, and senior officers' levels were previously governed under separate laws and authority. The Prisons Act Cap 86 captured the powers exercised by the Commissioner in dealing with Junior and Subordinate Officers, Senior Officers' conditions were similar to that of the civil servants. Essentially, what it means is that while the Commissioner reserved the powers to appoint, retain, and terminate Junior and Subordinate Officers, the Public Service Commission was empowered to deal with Senior Officers. However, it should be noted that the final decision to remove any officer including Subordinate, Junior, and Senior Officers had to be decided by the Public Service Commission after having exhausted the appeals process. This has changed under the Fiji Constitution 2013, which assigns the powers to appoint, retain, and terminate all officers to the Commissioner of Corrections (Constitution of Fiji, 2013).

The Constitution has also empowered the regime to implement the contract system consistent with the Civil Service Reforms governing the Open Merit Recruiting System (OMRS). The nature of contracts was consistent with the civil servants whose terms ranged from 6 months to 3 years. Moreover, hiring and firing have been made easy such that termination of employment increased from 9 in 2015 to 100 in 2018 (Fiji Corrections Annual Report 2018). Such a sudden increase in terminations and short-term tenure of 6 months can bring about uncertainty among prison officers and affect the morale and productivity of these officers.

The Fiji Correction Service Corporate Plan 2017–2018 highlights the organization's performance management, goal specifications, and performance targeting framework. The organization's key performance indicators include the reduction of escapes from its facilities, a reduction in recidivism rate, an increase in the Department's Trade and Manufacturing Account profitability and the payment of dividend to the government, and an increase in the number of ex-offenders successfully gaining formal employment.

While the primary function of the FCS is clear, other secondary functions such as the operation of the Trade and Manufacturing Account (TMA) have taken a more prominent role. The Trade and Manufacturing Account captures all incomes and expenditures of the Department's Small Business Unit. Experience of one of the current authors of this article as Deputy Commissioner of Fiji's Correction Service Prison and having first hand-knowledge suggests that there has been an increase in the payment of the dividend from the Correction Service Trade and Manufacturing Account to the Ministry of Finance. In 2015, the Fiji Correction Service returned $103,384.56 to government and in 2016 the figures doubled to $358,160.23 despite the government's financial year changing from June of that particular year to June of the following year (Corrections Service's Publication the Reformer 2018: No7). By 2018, the FCS paid $513,000 to the government purported to be a proportion of the revenue generated from its farm and industry sectors (Fiji Corrections Service, 2018).

Moreover, it is important to note that returning revenue does not constitute a measure of success, because under the law as it is not FCS's core business area. It is a by-product of rehabilitation made possible through the use of prisoner's labor. Instead, if it was to objectively measure success, it is the growth in skills set and the abilities of the prisoners that have undertaken vocational and life skill programs which really should be measured to ascertain if the skills and knowledge have been imparted to the prisoner and have been reintegrated to the community with job placements in the appropriate industry area.

Transportation of prisoners outside of prisoner facilities has improved compared to previous years. Since 2007, there have been acquisitions of specialized vehicles to transport high-risk prisoners. This sudden shift in focus from normal vehicles to specialized security-friendly vehicles has strengthened the FCS operational capability which was aimed at securing and containing prisoners. This strategy was appraised as perfectly aligned within the ambit of keeping prisoners under safe custody policy as earlier highlighted and which replaced the traditional method of using public vehicles on escorts of prisoners particularly to the Courts around the country.

Further, the Corrections Service's Publication, the Reformer (2018) Issue number 8 highlights that there has been an annual reduction in recidivism rate for the year ending 31 July 2018 to 1.5 % (equivalent to 27 persons) compared to 4.7 % (equivalent to 72 persons) for the year ending July 2017. They report that this 1.5 % is the lowest recidivism rate over the previous 10 years and attributed this to the collective efforts of all stakeholders. This positive change is a result of the throughcare strategy, which involves extending the delivery of rehabilitation to the doorsteps of all prisoners while they are incarcerated and also when they are discharged. This is contrary to the previous in-care strategy, wherein all rehabilitation efforts ended at the correction facility gates.

The need for new infrastructure development and supplies and logistical operations have provided the rationale for contracting out of service to optimize operational efficiencies and effectiveness. Through the Fiji Government's vehicle hiring policy, the Fiji Correction Service has received leased vehicles to carry out its statutory mandate. The construction of the new correction prison buildings in the four Divisions was contracted to private sector construction firms. This is based on NPM's theoretical belief that contracting out services to a private sector construction company is more efficient compared to public sector construction.

Finally, on the customer service dimension of the NPM framework, the FCS has not performed well. According to the 2016 Country Human Rights Report on Fiji, the system had insufficient

**New Public Management (NPM) Framework, Fiji Correction Services, Table 1** NPM implementation in FCS

| NPM components | KPI | Result |
|---|---|---|
| Delegation of authority | Powers of appointment delegated to Commissioner under Fiji's 2013 Constitution | Powers to appoint, promote, transfer and terminate an employee exercised by Commissioner through the Government's Open Merit Recruitment System (OMRS) |
| Performance management | FCS's key performance indicators under the FCS Act 2006:<br>Reduce correction breakout<br>Enhance the successful reintegration of inmates<br>Reduce recidivism<br>Improved infrastructure for containment | Continued Breakout of prisoners from prisons. Overcrowding<br>The reintegration of prisoners into society increased. Yellow Ribbon program and through care strategy successful<br>Recidivism rate reduced to 1.5 % in 2018, the lowest in comparison to the previous 10 years<br>Prison infrastructure facilities old. Operational effectiveness impeded |
| Employment contracting | FCS has adopted the Fiji Government's policy of employment contracting under the Open Merit Recruitment System (OMRS) | 3 years, 1 year, and six months' contract issued to staff. Uncertainty of employment especially with 6 months and 1-year contracts |
| Contracting out | Government vehicle leasing policy | FCS vehicles leased from private car dealers according to specifications as per government vehicle leasing policy. The containment of prisoners outside of prison facilities has improved |
| | Government contracting out services policy | Prison construction contracted out to the private sector. Efficiency achieved in delivery of prison infrastructure facility within time and specified cost and quality |
| Customer service | FCS corporate plan highlights two key indicators:<br>Improve processes and systems for quality service delivery<br>Improve health services to both staff and inmates | Insufficient beds, inadequate sanitation, and a shortage of other basic necessities<br>Two psychologists, some senior medical officers, doctors, and nurses were recruited for employment full-time at prison facilities to improve inmates' access to medical services. The impact of these recruitments yet to be ascertained |

beds, inadequate sanitation, and a shortage of other basic necessities. However, the report reveals that prison authorities had recruited two psychologists, some senior medical officers, doctors, and nurses for employment full time at prison facilities to improve inmates' access to medical services.

Based on the above analysis, the Table 1 below summarizes the NPM 5 key components, related FCS Key Performance indicators (KPI), and the performance results of each KPI.

## Key Findings

There is evidence that the key attributes of NPM have been implemented in the FCS albeit having some successes and challenges. The successes are evident in the performance management dimension, particularly the successful reintegration of prisoners into society through the yellow ribbon program and a reduction in the recidivism rate. The successful implementation of the contracting out policy has also improved the operational efficiency of the FCS as evident in the leasing of prison vehicles which has improved the transfer of prisoners outside the prison facilities and the cost and quality of the new prison facilities constructed by private firms.

However, there are some deficiencies in the implementation of the NPM attributes. One, the FCS has not performed well in relation to the performance management dimension as evidenced in the continued prison breakout and the existence of old prison facilities which has impeded operation efficiency. Secondly, on the contracting out dimension, it is worth noting that while contractual employment for prison officers has been implemented, the term of contracts for some prison officers is short (6 months). This can create uncertainties and lower the morale of prison officers, impact productivity, and affect operational efficiency. There is also a deficiency in the customer service dimension, especially as it relates to the presence of insufficient prison beds, inadequate sanitation, and a shortage of other basic necessities.

The article reveals that a continuation of the implementation of the NPM principles and elements highlighted earlier and in line with the government's reform commitment would raise efficiency gains for the Fiji Correction services and further in-depth analysis is a matter of investigation.

## New Public Management and Governance

Fatema Khatun
Department of Public Administration, Shahjalal University of Science & Technology, Sylhet, Bangladesh

### Synonyms

Governance; New Public Management (NPM); Privatization; Public Administration; Public Policy

### Definition

| | |
|---|---|
| New Public Management (NPM) | It is the application of theories and practices from business management and other disciplines to improve efficiency, effectiveness, and general performance of public services in modern bureaucracies. |
| Governance | It is the management of the development process, involving both the public and the private sectors. |

### Introduction

New Public Management has emerged as supervisory model in governance system since 1980s. Because old administration model has criticized for its incapability to deliver public service to people and could not fulfill people satisfaction. At the same time new public management have strong affinity to market and private sectors management which create strong competition in the market and this competition ensure real time public service (Islam 2015). NPM is a different paradigm of Public Management that makes forward relationship among governments, public service, and the public. New public management (NPM), management practices have drawn mainly from the private sector management now it's become a global phenomenon. NPM emphasizes on public management rather than traditional administration. The key elements include various forms of decentralizing management within public services (e.g., the creation of autonomous agencies and devolution of budgets and financial control), increasing use of markets and competition in the provision of public services (e.g., contracting out and other market-type mechanisms), and emphasis on performance, outputs and customer orientation, and privatization (Larbi 1999; Pollitt et al. 2004). On the other hand, Governance refers to "all of the processes of governing undertaken by a government, market or network through the laws, norms, power and authority" (Bevir 2013). Governance refers to a category of social facts. It is a process of interaction and decision-making with helps of different actors to solve collective problems of the society. This process leads to the designs, strengthening, and reproduction of social norms and help to make strong institutions (Hufty 2011).

### Conceptualization of New Public Management (NPM)

New Public Management represents a modern method in public administration. In this system, employs acquired knowledge and experiences from business management and other disciplines to improve efficiency, effectiveness, and general performance of public services in modern

bureaucracies (Vigoda 2003). NPM is as an interdisciplinary study of the generic aspects of administration. It is a combination of the planning, organizing, and controlling functions of management with the human resources, financial, physical, information, and political resources (Garson and Overman 1983).

NPM has seven interrelated elements such as hands-on professional management, explicit standards and measure of performance, output controls, a shift to disaggregation, a shift to greater competition, and stress on private sector styles of management practice, and discipline and parsimony in resource use (Hood 1991). NPM consist of different elements: cost reduction, capping budgets, and greater transparency in public resource management; Disaggregating traditional bureaucratic organizations into separate agencies; Decentralized management within public agencies; Separating the function of public services; Establishing market and quasi-market mechanisms; Emphasizing performance management targets; Introducing term contracts, performance-related compensation, and emphasis on quality service according to standard and customer demanded (Pollitt 1995). New public management pursues to implant a new approach in the traditional public administration for enhancing efficiency and efficacy, high productivity, improved service delivery, and last but not least accountability. In a precise summary form, NPM focuses on de-bureaucratization, flexibility, innovation. As NPM rely on private sector, enabling convenient environment for private enterprise is very much crucial to grow up, so that public official can manage faster service delivery among people through contracting out and outsourcing. NPM promotes offloading and downsizing, or rationalization of public officials, making public-private partnership, and strong competition because of strong market forces (Sharma 2006). This mechanism should be prescriptive, taking account of exhortatory. It has to descriptive, taking account of what has actually happened. It also be theoretical, specifying links with sciences theory, notably public choice and agency theory in economics and political, recognizing that any model of public management necessarily has a political dimension (Ewan et al. 2002). New public management emphasis on professional management, and efficiency and efficacy, decentralization, competition on the market and quasi-market, and output oriented which helps to reduction of cost and time and real time service due to strong competition in the market. People will get service on user pay bases (Hood 1991).

## The Reasons of Emergence of New of New Public Management

NPM's origin is as a combination of two different streams of ideas. One partner was the "new institutional economies." It was built on the now very familiar story of the post-World War II development of public choice, transactions cost theory and principal-agent theory (Hood 1991).

The new institutional economics program facilitated to make a set of administrative reform built on ideas of *contestability, user choice, transparency*, and close attention on *incentive structures*. Such reforms were very different from traditional military-bureaucratic ideas of "good administration," with their emphasis on orderly hierarchies and elimination of duplication or overlap (Osborne 2001). So the adoption of new forms of public management means the emergence of a new paradigm in the public sector and traditional public administration discredited theoretically and practically.

### The Attack on the Public Sector

The 1980s and early 1990s was a period of attacks on the size and capability of the public sector. Government, bureaucracy, was source of some unease in the community.

There were three main aspects of the attack on government:

(a) The scale of public sectors (the arguments was that government handling scale is simply too large, consuming too many scarce resources).
(b) The scope of the government (arguments was that government involves itself in too many activities).
(c) The methods of the government (arguments were that bureaucracy is a highly unpopular form of social organization).

### Economic Theory

Several economic theories have provided the theoretical underpinnings of NPM and have helped shape NPM ideas, in particular, these are:

- Public choice theory
- Principal/agent theory and
- Transaction cost theory

## Public Choice Theory

Public choice theory applied to the bureaucracy. In fact, Public choice is a sub-branch of economic thought concerned with the application of microeconomics to political and social areas (Mueller 2008). The key assumption of public choice is a comprehensive view of rationality. Instead of being motivated by the public interest, bureaucrats, like anyone else, are assumed to be motivated by their own selfish interest. Public choice provided alternatives, the most obvious being to allow competition and choice and to return as many activities as possible to the private sector.

## Principal/Agent Theory

The economic theory of principal and agent has also been applied to the public sector, especially concerning its accountability. The theory was developed for the private sector to explain the divergence often found between the goals of managers (agents) in private firms and shareholders (principals).

## Transaction Cost Theory

It is another key economic theory in the managerial changes. As set out by Williamson (1986), this challenges the notion that transactions are without cost and specifies the circumstances where a firm may prefer market-testing or contracting to in-house provision. There are some transactions sectors for example constructing roads and highways, transportation, public-private partnership, etc., which would be less costly if contracted out to reduce administrative costs and provide some competition (Hughes 1994).

## Governance Shift to NPM

For the long period of time, different actors were criticizing governments of many development and developing countries due to too much bureaucratization, inefficiency, and ineffectiveness and rampant corruption.

The degree of accountability was dwindling and people were losing trust upon government. Many scholars blamed that traditional model of public administration is the responsible for that kind of distrust. They were pursuing a new idea, a new model to adapt in government so that government overcomes from this critical situation. That pressure brought a new conception of New Public Management in 1980s. The belief that large and monopolistic public bureaucracies are inherently inefficient was a critical force driving the emergence of the New Public Management in the 1980s. To reconfigure the state along more cost-efficient (and effective) lines, NPM protagonists recommended that the public sector be opened up to greater private sector influence (Andrews and Walle 2013). And later, it replaced traditional public administration to make government more effective and efficient. In the 1990s the NPM has emerged as an alternative model against public administration's traditional bureaucratic paradigm

(Dhameja 2016). The reason is the nature of this conception. NPM focuses on what government ought to do, making the work better and solving the key problems of government as good as possible. That is why; the traditional public administration has been inevitably replaced new public management as a tactic.

| Characteristics | Traditional management (governance) | New public management |
|---|---|---|
| Values | Economy, efficiency, effectiveness | Cost-effectiveness, |
| View of individual | Impersonal case, rational actor | Customer |
| Budgeting | Rational | Performance-based |
| Decision making | Rational-comprehensive | Decentralized, cost- minimizing and profit maximization |
| Governmental function considered as | Execution | Execution |

Sources: Adopted from Rosenbloom, D. H. (1998) edited by the author

Public Administration can achieve its historic quest for both efficiency and responsiveness to the public through competitive market-like practices. However, NPM, market-based approach came for the betterment of citizens of a country. How it is practiced or criticized is not the fact, we cannot deny the changes it has brought. Some told, "The changes fashioned by New Public Management are now probably irreversible" (Lan and Rosenbloom 1992). NPM is very alive, even as a theory – and the more so further one depart from academy around the world. But this is also true on the level of European countries themselves, where it fits some strings of the dominating worldview(s) (Drechsler 2009) and international management consultants often are still strongly in favor of NPM. Because, their general worldview is in favor of applying private-sector tools in the public sector and, secondly, contracting-out management techniques and policy advice brings to their table. So, though there are a lot of proposed models against NPM, it is very clear that, they do not have enough power to bring about a serious breakthrough against NPM while the core principles of NPM will sustain and even become more dominant in the future, making isomorphic and global trends more evident. Economic neo-liberalism or market focused economy brought new public management into focus. Global leaders grabbed that NPM, only for facilitating free movement of market within an effective government management. So, market will always be there; and it is inevitable that as long as we favor market, surely NPM will prevail.

## Governance

The idea of governance is not new. The word "governance" came from the Latin verb "*gubernare*," or more originally from the Greek word "*kubernaein*," which means "to steer, to pilote." Basing on its etymology, governance refers to the manner of steering or governing, or of directing and controlling, a group of people or a state (Levi-Faur 2012).

## Definitions of Governance

Governance, a qualitative concept, is administration-cum-management plus, and hence more inclusive, more expansive, more citizen-cum-customer related and more modernly contemporary (Srivastava 2009). It has also been

considered as the way in which power is exercised by the political leaders in order to manage county's economic and social resources for ensuring development for the wellbeing (Pani and Mishra 2009; World Bank 1992, 1).

According to United Nations Economic and Social Commission for Asia and the Pacific: governance considered as the process of decision-making and the process by which decisions are implemented or not implemented (ESCAP 2006). Actually, Governance is the exercise of political, economic, and administrative authority to manage a nation's affairs and it is the complex mechanisms, processes, relationships, and institutions through which citizens and groups eloquent their interests, exercise their rights and obligations, and mediate their differences (UNDP). Governance may be taken to denote "how people are ruled how the affairs of a state are administered and regulated; it refers to a nations system of politics and how this functions in relation to public administration and law" (Khan 2008).

World Bank conceptualizes governance as the way power is exercised through a country's economic, political, and social institutions (World Bank's 1992).

This includes the process by which governments are selected, monitored, and replaced, the capacity of the government to effectively formulate and implement sound policies, and the respect of citizens and the state for the institutions that govern economic and social interactions amongst them (Kaufmann, Kraay and Zoido-Lobat'on 1999).

The Asian Development Bank (ADB) expressed that the term "governance" is the "manner in which power is exercised in the management of a countries economic and social resource for development" (ADB 1995).

The concept of good governance emerged mainly because practices of bad governance, like corruption, unaccountable governments, lack of transparency in public sector, absence of rule of law, lack of respect for human rights, etc. had become increasingly dangerous and need to be intervened (Hossen 2019).

On this meaning, the concept of governance is concerned directly with the management of the development process, involving both the public and the private sectors. It encompasses the functioning and capability of the public sector as well as rules and institutions that create the framework for the conduct of both public and private business, including accountability for economic and financial performance, and regulatory frameworks relating to companies, corporations, and partnerships. In broad terms, then, governance is about the institutional environment in which citizens interact among themselves and with government agencies/officials. Governance is the process whereby societies or organization make important decisions, determine whom they involve, and how they render account. In fact, Governance encompasses every institutions and organization in the society, from the family to the state and embraces all methods – good and bad – that societies use to distribute power and manage public resources and problems. The working definition used by the British Council, however, emphasizes that "governance" is a broader notion than government (and for that matter also related concepts like the state, good government and regime), and goes on to state: Governance involves interaction between the formal institutions and those in civil society. Governance refers to a process whereby elements in society exercise power, authority, and influence and enact policies and decisions regarding public life and social development. Governance is said to have three legs: economic, political, and administrative. Economic governance covers decision-making processes that affect a country's economic activities and its relationship with other economies. Political governance includes the formulation of policy, while administrative governance is the system of policy implementation. As can be seen from this and similar definitions used by international development agencies, governance is an all-encompassing concept. It permeates all sectors and it makes no distinction between governance, policy-making, and policy implementation (Hyden and Court 2002). Governance can be more understood by examining the functional dimensions of Governance and their Institution. Governance can be also termed as the operation

of three key actors; namely, State, Market, and Civil Society.

So therefore, Governance refers to the formation and stewardship of the formal and informal rules that regulate the public realm, the arena in which state as well as economic and societal actors interact to make decisions.

### Types of Governance

Governance defines a "new form of government" in the globalization. Here are some of the important types of governance like Democratic Governance-governance and Corporate Governance.

Democratic governance is beyond the subjects of foundations and forms of government. It covers the social synchronization tools elaborate in dogmatic action incorporated Periodic, free, fair, broadly participatory, and genuinely contested elections, together with a system of norms and institutions. On the one hand, governance is not a set of guidelines or an activity but a procedure. It mentions to the decision-making process within all groups in the social, political, economic, or private entities (Fortunato 2015). Governance aims, secondly, to facilitate participation in the definition of public policies, their implementation by multiple players who have neither the same interests nor the same modes of regulation: States, devolved administrations, enterprises, associations of people (Corry and Hodgetts 1951). The e-governance service is a holistic concept that defines and assesses the impact that information technology and communication have on government practices and relations between government and society as a whole.

E-Government denotes to the use by government interventions of information technologies (such as Wide Area Networks, the Internet, and mobile computing) that have the ability to renovate relations with citizen, business, and other arms of government (Bannister and Connolly 2012). These technologies can serve a variety of different ends: better delivery of government service to citizen, upgraded communications with business and industry, citizen empowerment through access to information (Savic 2006; Rahman 2019).

## Extent and Dimension of the Relationship Between New Public Management

NPM has covered a wide range of subjects. It involves disaggregation of large bureaucratic organizations into smaller compact organizations. Its main focuses on output rather than input. New public management tries to make sure maximum utilization of taxpayers' money, authority devolved at the point of service delivery, flexibility, customer responsiveness, and introduction of competition in public service, and strengthened accountability and transparency. Most contemporary processes of government reform are inspired by the ideas, techniques, and methodologies postulated by the New Public Management trend. This wave of government reforms that has recently dominated the international scene is based on the conviction that governments evaluated on results, that work on quasi-market situations, that are agile in performance, able to adopt private sector administrative techniques, and focused on client-citizen, are capable of obtaining better results and greater legitimacy. Some successful experiences and the persistence of international organizations to adopt these types of strategies, have undoubtedly contributed to an "imitation effect" or isomorphism, which has reached a great variety of countries. Nowadays, developed and emerging countries, as well as those buried in underdevelopment, equally aspire and strive to adopt in order to find a faster and more effective path to build "less expensive and more efficient" governments.. This seems to be reinforced on a context where political ideologies keep on loosing strength and continue to subordinate to the simple balanced results offered by political parties in power (Cabrero 2005). While governance tends to emphasize the horizontal relationships between governmental and other organizations, NPM can be considered an opposing paradigm to governance in many ways since it emphasizes central steering and political control where governance tends to emphasize the limits of central control (Hanf and Scharpf 1978).

In the last few years the preferred strategy for administrative modernization in the government

domain has been NPM. After nearly three decades of its conception, its virtues and limitations are still being intensively discussed. It is unquestionable and there is enough evidence to support that NPM offers useful tools for government reform processes in local districts. However, it is also undeniable that although NPM tools may be necessary, in no case are they sufficient, at least not in the context of democratic governments. Further, these strategies can occasionally delay or hinder wider strengthening processes of new local democratic reform. Such tools must be selected understanding the necessity for articulation along with wider processes of democratic transition. If in the long-term there are compatible solutions, the medium- and short-term reveal reform processes which compete with each other (Cabrero 2005). At the same time, the traditional bureaucracy of the public administration was generally criticized by the new public management (Dunleavy 1991). It is also claimed weaknesses or failures of traditional state bureaucracy, especially in terms of its monopolistic nature, unmanageable size, public inaccessibility, rampant corruption, and self-serving agenda plagued by progressive inflexibility based on complex hierarchical rule-based system and top-down decision-making process. It creates a high distance between bureaucrat and public in the decision-making (Yamamoto 2003). In the pattern of traditional governance toward being more bureaucratic, is work on process rather than outcomes, and emphasizing on instructions rather than emphasis on results. Since 1970, many criticisms about incompetent bureaucracy were done such a way that forced governments to focus formal instructions to modify by results (Fatemi and Behmanesh 2012). But these accusations against bureaucracy were always there in the past, the intensity of such anti-bureaucratic rhetoric was significantly increased during the 1980s and 1990s by the market-friendly ruling parties in advanced capitalist nations. The new Reform was to diminish the scope and strong role of bureaucracy, transfer resources and services from the public sector to the private sector, and restructure the public service in the image of business management. The reason is that the business sector was believed to be more competitive, productive, efficient, innovative, responsive, and customer-friendly (Haque 2004), while government sector was considered as rigid, expensive, and inefficient (Pierre and Peters 2000) which led to competition in the market through wide variety of interventions, trajectories, and reform intensities (Lodge and Gill 2011). New public management attempts to implement management ideas from business and private sector into the public services so that government can ensure people satisfaction (Hope 2001). It also emphasizes ensuring productivity, marketization, service orientation, decentralization, policy and accountability for results as the key ingredients of the global public-management revolution (Kettl 2006, 1–2). Within the context of the NPM, decentralization is seen as the means through which governments are able to provide high-quality services. It will reduce central administrative control as it will exercise more autonomy. It will also increase managerial capacity and individual performance (Borins 1994). Citizen will feel more empowered through active participation in decision-making and developing planning for ensuring better governance (Silverman 1992). NPM force government to rethink the role of the government that government has to ensure public service for the people through privatization (operational control and responsibilities for government functions and services to the private sector), deregulation, and marketization (Lane 2000).

## Conclusion

An important difference is how the two approaches view the role of elected politicians. Certainly in the beginning, NPM presents itself as technical. Goals are set by elected politicians and the NPM role is to implement their wishes. One could also say that NPM is more focused on output legitimacy (Scharpf 1997) in the sense that it wants to achieve outputs that meet the political goals. NPM, certainly in its early appearance, (re) introduces the separation between politics and administration. Politics sets the goals while implementers, whoever they are, do the job. Of course, one of the problems is that politicians do

not always formulate clear goals or when they do tend to change them if circumstances change (Scheduler 2003); a natural reaction if one wishes to survive in the political landscape. But changing goals after a while is not very compatible with organizing service provision and policy implementation by contracts and performance indicators. It is not that easy to break the contract open to include new performance indicators. The representation of the NPM method as purely technical is not entirely correct. As has been said, there is the idea of putting the consumer at the center and that might conflict with the prominent role of politicians.

If we look at both dominant views on management and the way they view complexity in society, we see that it is treated differently. New Public management tries to ignore or reduce complexity by abstaining from detailed governance but instead focuses on governing by output criteria and by organizing the playing field through market mechanism, privatization, etc. In NPM, the manager tries to keep as far as possible from the complex interaction system itself. The system is treated as a black box which reacts to its emerging characteristics by changing the output criteria or organizing the service provision differently by choosing other providers. Governance tries to address complexity by stepping into the complex system and designing mechanisms and strategies that are specifically targeted at the situation and characteristics of the process. NPM emphasizes on changes, result oriented, managerial innovations and new ideas about the role of government which led to fragmentation and coordination, equity, and social cohesion (Walle and Hammerschmid 2011). At the same time, Coordination become the main problem in making NPM work (Webb 1991), and the structural disaggregation of the public sector was seen to lead to deficient coordination, duplication, and even waste (Rhodes 1994).

# New Public Management Model and Performance Appraisal System

Anand Chand and Suwastika Naidu
School of Management and Public Administration, Faculty of Business and Economics, University of the South Pacific, Suva, Fiji Islands

## Synonyms

NPM model; Performance appraisal system; Public sector management; Reforms

## Definitions

1. **Performance appraisal system**: Is a human resource management system designed to

evaluate the performance of the employees in an organization.

2. **Public sector reforms**: These are actions taken by the government to reengineer the public service delivery in order to bring efficiency and effectiveness in the operations of the public service.

## Introduction

Globally, the public sector in many developing countries has been under a great deal of pressure post global financial crisis period. Resultantly, most countries have embarked on public sector reforms so that the efficiency and effectiveness of the public sector can be significantly improved. In most countries, the public sector has gone restructuring, reorganization, rationalization, and optimization (Baruch et al. 2014). One aspect of the reform process is the improvement of the performance appraisal system to remove "dead wood" and encourage more hardworking civil servants to provide better public service delivery.

In the current competitive world of business, human resources is one of the key resources that can help to determine the success or failure of an organization (Mensah and Seidu 2012). Within the field of human recourse management, performance appraisal system is an essential tool for effective evaluation, staff development, and management of employees. Performance appraisal system is the most debatable and detested field of human resource management studies (Dessler 2011; Pedrini 2016).

The paper is based on the primary survey of 112 civil servants who are currently working in Fiji's public service and explores their perception on the new performance appraisal system implemented in the public service after the year 2012. In order for any performance appraisal system to be perceived as "fair," it must be free from bias. More specifically, this paper focuses on two issues of the performance appraisal system, namely, (1) "rater/supervisor errors" and (2) "ratee/employee expectation." The New Public Management (NPM)-driven reforms in the Pacific Island countries seek to align the performance appraisal system in the public sector to meet the objectives of the performance appraisal system in the private sector.

There are two reasons why this study needs to be conducted. First, there are a number of studies conducted on performance appraisal system in the large developed and developing countries (Rego et al. 2010; Thurston Jr and McNall 2010). However, there is scant documentation on the performance appraisal system in the context of small island developing countries. This paper contributes to the existing literature on the performance appraisal system in the small island developing countries. Second, this study confirms that the New Public Management (NPM) tools of performance appraisal reforms have been ineffective in the case of the Fiji Islands because there are still evidences of biasness and errors in the performance appraisal system of the public service.

This paper is divided into seven subsections. Section "Background of the Performance Appraisal System in Fiji's Public Sector" provides the background of the performance appraisal system in the public sector of the Fiji Islands. Section "The NPM Model and the Performance Appraisal System Reforms" outlines the theoretical background related to the literature on the performance appraisal system. Section "Literature Review" reviews the existing literature. Section "Research Findings and Discussions" presents and discusses the research findings. Sections "Practical Implications of This Paper" and "Theoretical Implications of This Paper" presents theoretical and practical implications of this paper. Section "Conclusion" presents conclusion and directions for future research. The next section will provide background of the performance appraisal system in Fiji's public sector.

## Background of the Performance Appraisal System in Fiji's Public Sector

There are numerous areas where reforms have been implemented in the Pacific Island countries. Some of these areas include privatization of state-owned enterprises, tax reforms, human resource

management reforms, policy reforms, and governance system reforms. One of the key aspects of reforms in the area of human resource management is the reform of the performance appraisal system. In the year 1980, Fiji government began to dismantle state control via public sector reform policies so that a sustainable future can be secured for all Fijians. These reforms were mainly aimed at improving the effective utilization of the public funds by improving the allocation of public funds between current and capital expenditures. Prior to the year 2012, the Fiji public service had used an old underdeveloped performance appraisal system, and this was known as the "annual confidential report" (ACR), whereby supervisors used to write a confidential report about the employee. Unfortunately, employees were not given a chance to participate nor see the report.

Moreover, the ACR was filled by the supervisors (raters) without any feedback from the employees who were being reviewed. In the old system, employees received automatic pay increments until they reached the top of their salary scale. In the year 2012, as part of Fiji's public sector reform process, a new performance appraisal system known as "annual performance appraisal" (APA) was introduced in Fiji for the first time. This new annual performance appraisal system stopped the old practice of automatic pay increments and introduced a new system of merit-based pay.

Moreover, there are a number of objectives of implementing a performance appraisal system. The first objective is to ensure that the performance appraisal system is more transparent and employees can determine the areas where improvements are needed. The second objective is to measure employee performance and implement measures to improve employee performance (Aguinis et al. 2011). The third objective is to compensate and promote employees based on merit. Employees who are committed to the goals and objectives of the organization should be promoted and recognized as compared to their counterparts. It is intriguing to know whether the new APA system meets this objective of a good performance appraisal or not.

The next subsection will review the NPM model and the performance appraisal system reforms.

## The NPM Model and the Performance Appraisal System Reforms

There are a number of studies that have applied the NPM model to the reform process, but there are only a handful of studies that have applied the NPM model to examine performance appraisal system reforms (Aguinis et al. 2011; Bednall et al. 2014). In the recent decade, performance appraisal system reforms have been one of the key components of the public service delivery. Employees are the core machinery behind the delivery of the public services, and the performance appraisal system captures their yearly or biyearly performance in one exercise that happens in a few hours' time (Grote 2002; Scholtes 1993).

To date, none of the existing studies has examined the procedure involved in reforming the performance appraisal system in different geographical settings. The New Public Management (NPM) model is a generic model that has been continually applied for reforming the public service in the developing countries. Some countries have effectively embraced this model and were flexible in applying this model, while the rest of the countries applied this model to public sector reform process to please the donor agencies (Lane 2002; Naidu 2018).

Taking a look at the history, the idea about the New Public Management was introduced by the academics in the UK and Australia (Pollitt and Bouckaert 2004). One of the distinguishing features of the New Public Management was to use the private sector management styles in the public sector with the aim of improving the public service delivery (Kaboolian 1998). For instance, in the case of the private sector, the production decisions should be capitalized on the customers, whereas in the public sector, these decisions should be capitalized on the citizens of the country as the government seeks to serve the citizens of a nation (Christensen and Lægreid 2001; Green-pedersen 2002).

The term New Public Management was coined by Christopher Hood (1989) to extensively stress on the importance of implementing the private sector reengineering process to the operations of the public sector (Pollitt 1993). The sudden emergence of changing the operations of the public to more like private sector generated wave of discussions among the academics, policy makers, and practitioners. It has been noted that the term New Public Management is usually confused with the movements of New Public Administration that was evident in the USA during the 1960s and 1970s. A number of studies have noted that though there may be some similarities between the two approaches, there are evidences of significant differences, and these terms should not be used interchangeably (Hood 1991).

One of the basic premises of the NPM model is to adopt the private sector management style to the public sector (Diefenbach 2009). Surprisingly, most of the studies that have been conducted on the NPM model are mostly related to some of the elements of the NPM model with lack of emphasis on how these elements are applied to the management of public services. Slater (1998) and Daniels (1989) argued that the performance management system within the context of the private sector is a systemic data management approach that tries to implement synchronous procedures that link the performance appraisal to the factors that motivate employees and supervisors and encourage them to improve their productivity. Applying the NPM model to the implementation of the performance appraisal system in the public sector implies that the adoption of the performance appraisal system in the public sector should be driven by the private sector principles of fairness and equity (Aucoin 1990; Radnor and McGuire 2004).

One of the primary objectives of driving the performance appraisal reform efforts based on the NPM model in the developing countries is to ensure that organizational outcomes of high employee motivation and morale, and growth in organizational productivity, could be achieved (Andrews and Van de Walle 2013). One of the common ways how the performance appraisal system can lead to the achievement of organizational outcomes is that it should be perceived to be fair and free from errors (Cappelli and Conyon 2018). The human resource managers in the private sector ensure that the performance appraisal system in the private sector is continually improved to ensure that both employees and supervisors feel that the performance appraisal system is free from bias and errors (Madison et al. 2018).

Most studies on performance appraisal in the private sector have applied eight criteria to determine the supervisor errors. These seven errors are (1) halo effect, (2) leniency error, (3) similarity effect, (4) horn effect, (5) behavioral effect, (6) mood effect, and (7) rater accountability. Similarly, studies have used four ratee expectations to examine the ratee reactions to the performance appraisal process. These include (1) employee participation level, (2) feedback, (3) merit based, and (4) financial rewards and promotion.

This study seeks to apply these criteria to assess whether the new annual confidential report (ACP) was able to achieve its objective of making the performance appraisal system fair and objective. One of the basic objectives of the NPM model is to implement the private sector management styles in the public sector in order to improve the employee performance and increase productivity and innovation of the public service (Hood 1991). This paper will shed light on whether the NPM-driven reforms related to enhancing the quality of the performance appraisal system will make it error-free and remove the biasness from the performance appraisal system.

## Literature Review

Globally, in the last two decades, there has been a renewed interest by academics on the topics of performance appraisal system in most countries. As a result, there is extant literature on performance appraisal system in both developed and developing countries, though there is limited literature on the small island developing countries (Lefkowitz 2000; Antonioni and Park 2001; Forgas and George 2001; Levy and Williams 2004; Posthuma and Campion 2008; Mensah

and Seidu 2012; Naidu and Chand 2014a, b; Naidu et al. 2014). According to Mensah and Seidu (2012), there are possibilities of biasness and errors in the performance appraisal system. Two of the most studied aspects of the performance appraisal system are the "rater/supervisor errors" and the "ratee/employee's expectation" (Levy and Williams 2004; Mensah and Seidu 2012). The aim of this paper is to examine the prevalence of errors and biases in the new performance appraisal system implemented in the public sector in Fiji. To answer this research question, studies that are based on these two aspects of the performance appraisal system will be thoroughly examined.

## Literature on Rater/Supervisor Errors

The "rater error" refers to the problems/biasness created by supervisors when conducting performance appraisal for their subordinates. In most cases, raters/supervisors are usually blamed for the errors and distorting the objectivity of the performance appraisal system. A lot of researchers have looked at the "rater effect" and how raters can affect the outcome of performance appraisal system (Lefkowitz 2000; Antonioni and Park 2001; Forgas and George's 2001; Levy and Williams 2004; Posthuma and Campion 2008; Mensah and Seidu 2012). These researchers have identified a number of rater errors and these are as follows:

### Halo Effect

The first common rater error is the "halo" effect (Lefkowitz 2000; Antonioni and Park 2001; Forgas and George 2001; Levy and Williams 2004; Mensah and Seidu 2012). Halo effect is when a supervisor gives "good" rating to an employee albeit the employee's performance is "bad." This halo effect is normally present in cases where supervisors "like" and are "friend" of the employees (Mensah and Seidu 2012). Furthermore, Lefkowitz (2000) states that halo effect takes place when there is "good interpersonal relationship" between supervisors and employees. Moreover, Levy and Williams (2004) argue that halo effect may take place when a supervisor sees "one good characteristic" of employees affecting his/her perception of them, in which other possible bad qualities of employees are not taken into account. Furthermore, this halo effect can also occur when a supervisor does not assess all the tasks of an employee (Lefkowitz 2000; Mensah and Seidu 2012).

### Leniency Error

The second common rater error is the "leniency" error (Bernadin et al. 2000; Tziner and Kopelman 2002; Mensah and Seidu 2012). Leniency error is when supervisors are "lenient" and give "good" rating to employees although the employee's performance is "bad" (Jawahar and Williams 1997; Bernadin et al. 2000; Tziner and Kopelman 2002; Mensah and Seidu 2012). These studies found that most supervisors give lenient rating to employees because they do not want to spoil their future working relationship with an employee. Furthermore, Jawahar and Williams (1997) found that performance appraisal ratings are more lenient when they are aimed at employee's development purposes.

### Similarity Effect

The third common rater error is the "similarity" effect. The "similarity" effect is when supervisors give "good" rating to employees with whom they are able to associate with (Varma and Stroh 2001; Furnham and Stringfield 2001; Posthuma and Campion 2008; Mensah and Seidu 2012). The similarity effect occurs when raters tend to give better rating to those subordinates to whom they are easily able to associate themselves based on behavior, personality, or background. For example, this occurs when supervisors and employees are of the same "race," "gender," and "religion," go to the "same church," and play the "same sports" (Varma and Stroh 2001; Furnham and Stringfield 2001; Posthuma and Campion 2008). Posthuma and Campion (2008) argued that employees might also contribute to this error when they make efforts to prove to their supervisors that their behaviors are similar to their superiors.

### Horn Effect

The fourth common rater error is the "horn" effect (Lefkowitz 2000; Forgas and George 2001; Levy

and Williams 2004). Horn effect is the opposite of halo effect, whereby supervisors are "strict" and give "bad" rating to employees even though their performances are "good." For example, Lefkowitz (2000) argues that some supervisors have tendencies to view negatively all behaviors or actions of employees because he/she dislikes a particular behavior or action of employees.

### Behavioral Effect

The fifth common rater error is the "behavioral effect" (Klimoski and Inks 1990; Frink and Ferris 1998; Struthers et al. 1998; Johnson et al. 2002; Shore and Tashchian 2002; Mero et al. 2003). The "behavioral effect" is when a supervisor rating of an employee is affected by employees' past behavior and not the current performance. Studies have found that some supervisors consider employee's "past behaviors" and "past reputations" when drawing attributional inferences and deciding on their employee's ratings. For example, on the one hand, past good behavior of employees tends to receive good rating. On the other hand, bad behavior in the past will taint their current rating even though an employee may have improved his or her performance (Klimoski and Inks 1990; Frink and Ferris 1998; Struthers et al. 1998; Johnson et al. 2002; Shore and Tashchian 2002; Mero et al. 2003).

### Mood Effect

The sixth common rater error is the "mood" effect of supervisors (Lefkowitz 2000; Forgas and George's 2001). On the one hand, supervisors in good mood tend to recall positive information and appraise employee performance, thus having a positive effect on their rating. On the other hand, supervisors in bad mood recall "negative information" and give poor rating to the employees (Lefkowitz 2000; Antonioni and Park 2001). Antonioni and Park (2001) found that "mood" of supervisors is strongly related to rating leniency as compared to traditional top-down ratings. In the past, some studies had assumed that raters were motivated to rate accurately, therefore contributing to "cognitive processing" errors (Levy and Williams 2004).

### Rater Accountability

Finally, the seventh common rater error is the "rater accountability" (Klimoski and Inks 1990; Frink and Ferris 1998; Struthers et al. 1998; Johnson et al. 2002; Shore and Tashchian 2002; Mero et al. 2003). Studies by these authors found that supervisors are more likely to distort employee appraisal ratings when they are less accountable to employees for their ratings. On the other hand, supervisors are less likely to distort employee appraisal ratings when they are to be held accountable to employees for their ratings.

## Literature on Ratee Expectation

The "ratee expectation" is another most studied aspect of the performance appraisal system. There are a lot of studies on ratee's expectation, motivation, and reactions to performance appraisal processes (Campbell et al. 1998; Goss 2001; Mani 2002; Levy and Williams 2004; Posthuma and Campion 2008; Mensah and Seidu 2012). These studies have identified what ratee's expect out of the performance appraisal system and what are the key variables for the effectiveness and success of any performance appraisal system.

### Employee Participation Level

Firstly, the performance appraisal system will be more effective if the appraisal process is transparent and allows an employee to "participate" in all the stages of the performance appraisal system. This would involve starting from setting the goals to the final stage of the result (Roberts and Reed 1996; Pettijohn et al. 2001; Roberts 2003; Armstrong 2003; Mensah and Seidu 2012). These authors have found that employees would be more favorable to a performance appraisal process which is transparent and allows employees to participate in the design and implementation of the performance appraisal system. Without adequate consultation, participation, explanation, and training, a performance appraisal system will not be effective and acceptable by employees.

### Feedback

Secondly, employees are more likely to support the performance appraisal system if they see the

process as a useful source of feedback to help them improve their performance (Mullins 2005; Posthuma and Campion 2008; Mensah and Seidu 2012). These authors have found that in most performance appraisal system, employees are not given adequate or have no feedback on their performance on a regular basis. These authors suggest that in any performance appraisal system, there must be a quarterly (every 3 months) feedback given to employees, so employees are able to improve their performance (Mullins 2005; Posthuma and Campion 2008; Mensah and Seidu 2012).

**Staff Development** Thirdly, employees are more likely to support the performance appraisal system if they see the process as an opportunity for personal staff development and a chance to apply their skills and abilities at work (Posthuma and Campion 2008). An effective performance appraisal system in organizations is imperative as appraisals help develop employees and motivate employees to provide better service delivery to the public (Mensah and Seidu 2012). In other words, these authors argue that a performance appraisal system should be more geared to "staff development" rather than used as a "punitive" measure to punish those who are not performing at a satisfactory level.

### Merit Based

Fourthly, employees are more likely to support and accept a performance appraisal system if they see the process as "merit based," "objective," and "fair" (Roberts and Reed 1996; Roberts (2003), Pettijohn et al. 2001; Armstrong 2003; Bohlander and Snell 2004; Posthuma and Campion 2008; Mensah and Seidu 2012). These authors argue that a performance appraisal system can become more effective by having an objective, merit-based, and acceptable performance appraisal system. Unfortunately, only few organizations have effective performance appraisal system (Corbett and Kenny 2001; Hennessey and Bernadin 2003; Mensah and Seidu 2012). These authors argue that the performance appraisal system should not only be "fair" but has to be "seen" to be fair. Furthermore, Pettijohn et al. (2001) argued that employee perceptions of fairness are linked to employee motivation and productivity. Similarly, Roberts (2003) highlights that employee participation and acceptance of the performance appraisal system have impact on satisfaction which can lead to increased productivity. Hence, a good performance appraisal system has to be relevant, objective, fair, and satisfactory to both management and employees.

### Financial Rewards and Promotion

Finally, Posthuma and Campion (2008) and Levy and Williams (2004) found that ratees are motivated if the performance appraisal ratings are linked to financial rewards and promotion. Mani (2002) found that merit-based pay systems are acceptable to employees, and there is little evidence to show that all employees who deserve pay increase actually get a pay rise. While pay is linked to employee satisfaction and productivity, few organizations link the performance appraisal system to pay or bonuses in a clear and systematic manner. Furthermore, studies point out that the biggest complaint from employees is that the performance appraisal system is not always fair and does not lead to promotion (Gurbuz and Dikmenli 2007; Posthuma and Campion 2008). These authors reveal that employees are likely to accept and support the performance appraisal system if they believe that this will lead to pay increase and promotion.

## Methodology

The main aim of this paper was to determine the presence of errors and biases in the performance appraisal system of the public sector. In order to answer this research question, this study used mixed-method approach to collect data for this study. A questionnaire was used to collect data for this study. Two-step procedures were used to identify the civil servants to be studied in this study. The first step involved determining the civil servants who had undergone the performance appraisal process under the new system.

And the second step involved interviewing them by using the questionnaires.

Out of the 832 interviews conducted by the civil servants by using the questionnaires, 335 were males and 497 were females. There is one reason for using the questionnaire for collecting data for this study. Firstly, the questionnaire is not subject to interviewer bias and maintains a high degree of consistency during the interviews. A purposively sampling technique was used because purposive sampling technique allows for the selection of respondents who are more likely to provide the right and in-depth information for the study.

The semi-structured questionnaire was pilot tested before the actual interviews were conducted by using the questionnaires. The pilot testing of the questionnaire was essential in order to ensure that there is correct flow of information in the questionnaire. The data collected was cleaned and coded, and frequency tables were generated by using the Statistical Package for the Science Sciences (SPSS).

## Research Findings and Discussions

### Respondents' Perception of Rater Errors

The overall findings from this study show that the new performance appraisal system of Fiji is still subject to errors and biases. There are significant evidences of biases from the side of the raters and ratees.

#### Perception of the Halo Effect

The first common rater error is the "halo" effect which occurs when supervisors give "good" rating to employees though employees' performances are "not good" (Lefkowitz 2000). The research findings showed that the 60.7% of civil servants mentioned that supervisors "sometimes" give good rating to their subordinates even when their performance is bad (halo effect). Only 17.9% of the respondents believed that supervisors are not biased. Civil servants mentioned that biasness exists due to reasons such as "nepotism," "the old boys club system operates," "good boys/girls of supervisors," "giving gifts to supervisors," and "corruption." The basic premise of the NPM reforms was designed to eliminate biasness, nepotism, and corruption from the public service (Aucoin 1990; Radnor and McGuire 2004). However, the new performance appraisal system was not able to address these constraints that were part of the previous performance appraisal system.

#### Perception of the Similarity Effect

The second common rater error is the "similarity" effect. "Similarity effect" occurs when supervisors give "good" rating to employees who are similar to them (Tziner and Kopelman 2002; Mensah and Seidu 2012). The findings from this study show that 60.7% of the civil servants mentioned that supervisors "sometimes" give good rating to their subordinates who they feel are similar to them. For instance, subordinates who go to the same church and play the same sports may be awarded with higher ratings (Varma and Stroh 2001; Furnham and Stringfield 2001; Posthuma and Campion 2008).

#### Perception of the Leniency Effect

The third common rater error is the "leniency" error. This error refers to supervisors giving good rating to employees though the employee's performance is "not good" (Tziner and Kopelman 2002). Leniency error normally takes place when supervisors do not wish to "spoil their future working relationship with employees and hence give them good ratings" (Jawahar and Williams 1997; Tziner and Kopelman 2002). The findings from this study showed that 70.4% of civil servants mentioned that supervisors give good rating (leniency error) to their subordinates because they do not want to "spoil their future working relationship" with them (Tziner and Kopelman 2002). The overall idea behind the NPM reforms is to ensure that employees are given correct ratings on their performance appraisal so that they are able to use it as an improvement tool. Being lenient while giving ratings to employees is a drawback to productivity improvements in the public service (Christensen and Lægreid 2001; Greenpedersen 2002). The objective of NPM reforms in the small island developing countries will not

be realized if supervisors distort the performance appraisal ratings by giving employees too lenient feedback (Aucoin 1990; Radnor and McGuire 2004). According to one of the employees:

> . . .Supervisors should always be giving the rating to the employees that they deserve otherwise there is no use of a performance appraisal exercise . . .

### Perception of the Horn Effect

The fourth common rater error is the horn effect. Horn effect is when supervisors give "bad" rating to employees though the employee's performance is "good" (Lefkowitz 2000). "Horn" effect is the opposite of "halo" effect. The findings from this study found that 73.2% of civil servants mentioned that supervisors "sometimes" give bad rating to their subordinates even when their performance is good (horn effect). According to one of the civil servants:

> . . .I have always perceived that some supervisors see the performance appraisal exercise as a cumbersome task that only involves filling the performance appraisal forms. There are some supervisors who give us poor rating because they feel that if they give us higher ratings, we will not try to improve our performance. However, there are supervisors who give lower ratings to employees because they are jealous of them. . .

Jealousy, insecurity, and greed are some of the constraints that restrict the implementation of an error-free performance appraisal system. These constraints will reduce employee motivation and productivity at the workplace. The NPM reforms are directed toward enhancing employee motivation and productivity so that employees can continually improve their performance to delight the public (Cappelli and Conyon 2018). In Fiji, since job mobility in the labor market is limited, supervisors do have the fear that good employees may replace them in the future. Another reason is that some supervisors want to create the impression that they are in power and are not willing to give good ratings even if employee's actual performance is very good (Tziner and Kopelman 2002).

## Perception of the Ratee Expectations

This section presents the results on "ratee expectations" from the performance appraisal system in Fiji.

**Perception on participation/consultation**: The performance appraisal system that has the most impact on the ratees, therefore, should be involved in all the stages of the performance appraisal system. The findings from this study showed that 28.6% of the respondents were "sometimes" consulted on the performance appraisal system. According to Armstrong (2003) and Mensah and Seidu (2012), the performance appraisal system is transparent if employees are involved in the formulation and implementation of the performance appraisal system. According to one of the civil servants:

> . . .When we are involved in the performance appraisal system from the starting, we get a sense of feeling that the ministries recognize and value our importance and contribution to the organization. This is not the case here at all. We are only involved when the performance appraisal system is implemented. . .

O'Donnell et al. (2011) argued that the New Public Management reforms were implemented to enhance employee participation and consultation in the decision-making process. Countries that do not consult or involve employees in the decision-making process are not following the key objectives of the NPM reforms.

**Perceptions on feedback**: The findings from this study showed that 25% of the civil servants mentioned that their supervisors never gave them any feedback in order to improve their performance, and another 42.9% of the respondents mentioned that they got the feedback during the final annual rating period. According to Mullins (2005) and Posthuma and Campion (2008), feedback should be provided to employees after every quarter as this ensures that employees are continuously improving their performance. According to one of the civil servants:

> . . .The whole idea about the performance appraisal system is to improve employee's performance and when feedback is not provided in a timely manner, it is difficult to improve employee's performance. We get little or no feedback on our performance from our supervisor's. Our supervisors do not have meetings with us to discuss their performance on regular intervals. . . .

One of the basic premises of the NPM reforms is to provide feedback to the employees in a

timely manner. The whole idea of reengineering the public sector processes is defeated if timely feedback is not provided. Without feedback there will be no improvements (Hood 1991; Dunleavy et al. 2006).

**Perception of staff development**: The findings from this study showed that 46.4% of the respondents mentioned that the performance appraisal system is hardly linked to staff development. Mensah and Seidu (2012) emphasized that performance appraisal system should be used as a tool to guide the training programs that are needed by the employees in the public sector. According to one of the civil servants:

> . . .When an employee is given poor rating, the supervisors should be able to determine the types of training programs that is needed for the employee. One of the important factors in this situation is the ability of the supervisors to retrieve correct information from the performance appraisal system. If there are problems in the appraisal, it is difficult for them to retrieve correct information on training and development of employees . . .

The NPM reforms are centered on training and developing staff as they are the key resources that are used to deliver public services. Civil servants are only able to perform better and improve public service delivery if their performance appraisal is linked to staff development (Andrews and Van de Walle 2013).

**Perception of objectivity/fairness**: The findings from this study showed that 39.3% of the civil servants mentioned that the performance appraisal system in Fiji's public sector is "never objective," and another 19.6% of the respondents mentioned that it is sometimes "fair." According to one of the civil servants:

> . . .I am not really interested in the performance appraisal system because I feel that is not fair on me. My supervisor has been trying to bully me by giving poor ratings on my performance appraisal. As a result of this, I have lost interest in the performance appraisal system . . .

As argued by Pettijohn et al. (2001) and Roberts (2003), the government officials involved in the formulation and implementation of the performance appraisal system should ensure that the performance appraisal system is fair by being transparent and effectively communicating to the employees on the objectives of the performance appraisal system. The NPM reforms emphasize on fairness and equity in the delivery of public services. Performance appraisal system is part of the provision of public services to improve the public service delivery. If this performance measurement and improvement tool is not fair, it will be extremely difficult to improve employee's performance (Bryson et al. 2014).

**Perception on financial rewards and promotion**: The findings from this study showed that 25.0% of the civil servants mentioned that the performance appraisal system in Fiji's public sector is not linked to financial rewards and promotion, and another 17.9% of the respondents mentioned that the performance appraisal system is "sometimes" linked to financial rewards and promotion. According to one of the civil servants:

> . . .I think that the whole performance appraisal exercise is a waste of time. I think that it is a form filling exercise rather than an exercise to appraise our performance. I do not think that we are ready to improve our performance if the government does not provide us with incentives. . .

According to Posthuma and Campion (2008) and Levy and Williams (2004), performance appraisal system will only lead to improvement in employee performance if it is linked to organizational performance. Moon (2000) highlighted that the NPM emphasizes on the performance-based pay, and when pay is not linked to performance, it is difficult to enhance employee's performance. Parallel to the findings of Moon (2000), this study also emphasized that employees are demotivated when pay is not linked to performance via the performance appraisal system.

## Practical Implications of This Paper

There are two important practical implications of this paper. Firstly, it is essential for the policy makers to realize that performance appraisal is not an exercise, whereby employees are required to fill the paperwork. It is a rigorous exercise that involves assessing employee's performance and making recommendations for improving employee's performance. If the performance

appraisal system is not tied to rewards, it is difficult to improve employee's performance. It is essential for the government to tie the performance appraisal system to the rewards in order to ensure that the objectives of NPM reforms could be effectively achieved. Secondly, the government should ensure that feedback is continually provided to the employees and employees use these feedbacks to improve their performance. If the outputs from the performance appraisal system are not effectively used, then the whole performance appraisal system becomes a worthless exercise.

## Theoretical Implications of This Paper

There are two important theoretical implications of this paper. Firstly, this study contributes to the literature on NPM reforms and emphasizes primarily on the performance appraisal system reforms in the public sector. The NPM-driven reforms in the small island developing countries were mainly to improve the efficiency and effectiveness of the public sector. This study emphasized that NPM-driven reforms may not be effective if it is not planned and executed well. Secondly, this study confirms to the idea that donor agencies do need to provide human capital support in order to ensure that NPM-driven reforms are successful in Fiji. This study supports existing studies that have already proved that NPM-driven reforms are not successful in the context of Fiji.

## Conclusion

The main aim of this paper was to examine the prevalence of biases and errors in the new performance appraisal system implemented in the public sector of the Fiji Islands. The findings from this study showed that the current performance appraisal system is better than the previous one, but there are still major evidences of biases and errors in the new performance appraisal system. This study also confirms the findings from existing studies that NPM-driven reforms are ineffective in the case of the small island developing countries and large developing countries. These reforms are implemented to please the donor agencies, but the objectives of these reforms have hardly been realized. One of the limitations of this study is that it is conducted in one small island developing country. Similar studies should be conducted on other small island developing countries, and the findings should be compared across the geographical regions.

# New Public Management Reform in the Caribbean

Ann Marie Bissessar
Faculty of Social Sciences, The University of the West Indies, St. Augustine, Trinidad and Tobago

## Synonyms

Executive authority; New administration

## Definition

New Public Management is defined as a new way of managing public sector organizations, a new conceptual and ideological framework based on market ideology, ideology of managerialism, etc. as opposed to traditional models of bureaucracy-led public management.

## Introduction

The literature on public sector reform or more specifically *New Public Management reform* in countries such as the United Kingdom, the United States, New Zealand, and Australia has generated a bewildering variety of approaches to the topic, with writers applying varying emphasis. Writers such as Perry and Kramer (1983) suggest that public management was a merger of the normative orientation of traditional public administration and the instrumental orientation of general management. Pollitt (1996) contended that it was an evolution of the old model of public administration. What was evident was that the new model had several interpretations. Some referred to it as "managerialism" (Pollitt 1990), some as "new public management" (Hood 1991), and some as "market-based public administration" and yet others "entrepreneurial government" (Osborne and Gaebler 1992). Increasingly, however, the conclusion was that this "new" mode of administration or management placed a heavy emphasis on organizational performance and the measurement of this performance in the public sectors of the various countries.

## Main Text

While New Public Management reforms were quickly adopted in the more liberal democracies, these "market-driven" reforms in the Caribbean countries were introduced in a few countries such as Jamaica, Trinidad and Tobago, and Barbados, while smaller countries such as Antigua, Grenada, and St Vincent applied some incremental if not ad hoc reforms. The application as well as the

N

success of these reform measures varied from country to country (in the case of the Caribbean) and to a large extent depended on the relationship that individual countries held with the International Monetary Fund and the World Bank. It was found that the more countries depended on these institutions for funding, the reforms that were introduced in these countries mimicked the New Public Management features that were initially introduced in Britain.

In examining the reasons for the differences in and between the islands of the Caribbean, perhaps the starting point will be to examine the factors that were largely responsible for the change from the model of Public Administration to New Public Management. Hood (1991) suggested that the introduction of New Public Management reforms, particularly in the case of the United Kingdom, was based on four mega trends, namely, the attempts to slow down or reverse government growth in terms of overt public spending and staff, the shift toward privatization and quasi-privatization and away from core government institutions with renewed emphasis on subsidiarity in service provision, the development of automation particularly in information technology, and the development of a more international agenda increasingly focused on general issues of public management, policy design, decision styles, and intergovernmental cooperation.

Farazmand (2004) while agreeing with Hood (1991) expands on these factors. He cites factors such as the declining domestic economies of the powerful industrialized countries of the north; the military and political pressures of the latter nations on the Third World countries; the fall of the USSR as an alternative world system power, the role of Western ideological propaganda, and the role of the United Nations' agencies such as the International Monetary Fund; the World Bank and the World Trade Organization; and rising citizen expectations and the availability of new, cheap labor force across gender and national groups worldwide (Kroner et al. 1987). In the case of the countries of the English-speaking Caribbean, it is clear that that while the mega trends raised by Hood (1991) were relevant, what pushed New Public Management reforms on the political agenda of the larger countries (Jamaica, Trinidad and Tobago, and Barbados) was primarily due to one of the factors cited by Farazmand (2004), namely, the insistence of the International Monetary Fund and the World Bank that before loans could be available to these countries they had to introduce comprehensive reform of their public sectors. Indeed, these institutions were appropriately defined by Krasner (1983) as "defining" regimes.

## Factors Leading to the Introduction of New Public Management

In the 1960s, many Third World countries, including the islands of the Caribbean, had an accumulation of foreign debt. Taken as a whole for Third World countries, this debt stood at US $18,000 million and within 10 years (1970s) had rocketed to US $75,000 million and at the beginning of the "oil crisis" reached US$112,000 million dollars. However, acute debt crisis requiring rescheduling arrangements remained comparatively rare until the mid-1970s. By 1973, with the quadrupling of the price of crude oil by the Organization of Petroleum Exporting Countries (OPEC), banks commenced funding governments by way of loans which were accompanied by variable interest rates. One estimate is that by the end of 1977, this deficit had amounted to US$57,000 million dollars and rose to US$155,000 million in 1982 (Krasner 1983).

## New Public Management Reform in Jamaica

Jamaica, one of the larger countries in the English-speaking Caribbean, was the first to approach the IMF in 1977. They entered into a 2-year standby agreement with this institution. One condition accompanying this loan arrangement with the IMF was that Jamaica should restructure its economy. By 1979 Jamaica broke off this agreement because of the seemingly austere measures. When a new party, the Jamaica Labour Party led by Edward Seaga assumed office in 1982, they approached the IMF and World Bank. The reform effort at first focused on the restructuring of the economy in areas of trade and exchange and

taxation. A number of deficiencies were identified in the public sector in the case of Jamaica. Challenges identified included the lack of capacity within the public sector as well as a weak and apathetic public service. The lack of proper control in the budget and major inadequacies in the cash management systems were also areas of concern. In 1983, the World Bank incorporated administrative reform as a central plank of the structural adjustment loan to Jamaica. The country entered into another structural adjustment loan during the periods 1984–1988. The reforms proposed in the case of Jamaica during this period could be subsumed under four major headings. The first aspect was to reduce the size of the public sector and reinforce the role of the private sector in the economy by sale or lease of assets and contracting out of services. The second proposal was to improve the financial performance and the service provided by certain key public enterprises. The third aspect was to strengthen the Public Enterprises Unit of the Ministry of Finance in order to improve its ability to monitor and evaluate the performance of the major parasternal bodies. Finally the establishment of a Standing Working Group to improve the preparation and monitoring of the Public Sector Programme was introduced.

Jamaica's reform efforts were introduced in a number of phases, and as Davis (2001) suggested, substantial reforms were introduced. The first plank of the reform agenda in the case of Jamaica involved a redefinition of the role of the state. The principles of the New Public Management doctrine were clearly enunciated with the decision being taken that the government should not involve itself in all activities of the state. The Government of Jamaica thus entered into a number of arrangements including privatization and quasi-privatization of its state-owned enterprises. The Government of Jamaica also introduced, similar to the organizations introduced in the case of Britain, executive agencies. Apart from breaking up the "monolithic units" of the state, the Government of Jamaica also redefined the role and functions of the public sector. By introducing parastatal organizations, it was quite clear that the government insisted that "managers should be free to manage." Private sector modes of operations were also introduced in the public sector. Greater reliance was placed on benchmaking, and there was a clear emphasis on competition and profits. In addition, there was a concerted attempt to introduce contract agreements in the different sectors including the health sector. Human resource management also replaced the older model of personnel administration, and compensation packages were re-negotiated among a number of other initiatives.

## New Public Management Reform in Trinidad and Tobago

In the case of Trinidad and Tobago, when a new administration assumed office in 1986, the new government announced to the general population that the treasury was "empty." The end result was that in 1988, the Government of Trinidad and Tobago approached the IMF and the World Bank. The structural adjustment conditions accompanying this loan was similar to that established in the case of Jamaica. The Government of Trinidad and Tobago however applied a number of measures in order to balance its economy. Among these measures was the introduction of voluntary separation plan, an early retirement scheme, and retrenchment of public officers in selected state agencies. In addition, the government reduced the salary of all public officers by 10%. It also froze annual incremental payments. The introduction of these measures was insufficient to bring expenditure of the state in line with its income. Like its neighbor Jamaica, it too embarked on privatization of some identified state-owned enterprises. However, the scale of this initiative was ad hoc and limited.

Like Jamaica, too, but on a much smaller scale, the Government of Trinidad and Tobago embraced the idea of executive agencies. The success stories accompanying this initiative are limited. Unlike the rigid adherence to the application and the introduction of reform measures by the Jamaican government, in the case of Trinidad and Tobago, reforms have been introduced in a rather ad hoc fashion. While there have been

concerted attempts to replace the personnel administration methods with human resource introductions to date, it appears merely to be a change of names rather than a change in the mode of operations. The major deficiency by the Government of Trinidad and Tobago was that they failed to address key issues including the drafting of new legislation and regulation, the inability to introduce new performance appraisal systems, and perhaps the lack of emphasis by the government to place sufficient emphasis on the reform of the public sector. In a comparison with the Jamaican case, it is evident that Jamaica adhered to Public Management Reforms since it continued to rely on the IMF and World Bank for funding. In the case of Trinidad and Tobago, however, as soon as this country experienced a windfall in the price of its primary commodity, oil, the emphasis on introducing New Public Management reforms was placed on the back burner, and increasing emphasis was placed on infrastructural developments.

### New Public Management Reform in Barbados

In the case of Barbados, like Trinidad and Tobago, New Public Management reforms were not well established as in the case of Jamaica. Barbados embarked on limited privatization of its state-owned enterprises and attempted to introduce human resource management practices in the public sector. Not surprisingly, like Trinidad and Tobago, Barbados is not as dependent as Jamaica on loans from the IMF and World Bank. To a large extent, then, the scale and scope of New Public Management reforms are not as comprehensive as it is in the case of Jamaica. The initiatives introduced by the Government of Barbados included program- and performance-based budgeting, pension reform, the improvement of the financial management information system, the computerization of the procurement systems, and accrual accounting. In other words, the Government of Barbados appears to have placed emphasis on its accounting and procurement system rather than wider New Public Management reforms.

## Conclusion

In evaluating the success of New Public Management reforms in the countries of Jamaica, Trinidad and Tobago and Barbados, it is evident that Jamaica introduced numerous aspects of the reforms and to a large extent mirrored those measures that were introduced in the more developed countries such as Britain, Canada, and the United States. In the case of both Trinidad and Tobago and Barbados, the attempts could be described as ad hoc. One possible explanation for the differences in the application of New Public Management reforms in these three countries was the extent of its involvement with the International Monetary Fund (IMF). To a large extent, the level of indebtedness that Jamaica had with the IMF meant that it was obliged to introduce the wide-sweeping reforms prescribed by this agency.

# New Public Management, Corruption, Information Computer Technology, and Budget Deficit: Fiji, Jamaica, and Mauritius

Suwastika Naidu
University of the South Pacific, Suva, Fiji Islands

## Synonyms

Budget deficit; Corruption; Information computer technology

## Definitions

**Budget deficit**: It is a sustainability indicator of an economy's sustainability.
**Corruption**: It refers the fraudulent and dishonest practice.
**New Public Management**: Reform model pioneered by the donor agencies to improve the public service delivery of the oversized and underperforming governments.

## Introduction

The budget deficit has long run impact on the economic growth rate. Globally, there are many economies that have gone bankrupt because their national government was not able to effectively manage their budget deficit (Guajardo et al. 2014). Corruption is not only a problematic issue in the large developed and developing countries, it is also an issue of concern to the small island developing countries. The contemporary global strive is to make our economies more efficient and effective by improving the performance of the public sector. The performance of the public sector is closely knitted to the performance of the private sector. The role of the public officials is to develop a conducive business environment that will help the private sector to bloom in the context of hyper competition and rapid technological changes. A notable debate in the existing literature emphasizes on the importance of improving the transparency and accountability of the public sector in order to improve the performance of the private sector. It is imperative to emphasize on the importance of improving the transparency and accountability of the public sector. Essentially, the public sector reforms were implemented globally to improve the transparency and accountability of the public sector.

Furthermore, it should be noted that the high level of budget deficits experienced by a number of countries around the world is one of the reasons for the New Public Management-driven reforms. The basic premise of the NPM-driven reforms is to break away from the traditional methods of managing the operations of the public service and implement new forms of managing the public sector (Hood 1991). In the last 15 years or so, significant changes have been noticed in countries like Australia and New Zealand to improve the performance of the public service. The whole idea of the NPM-driven reforms was to make the public sector more efficient by reducing the budget deficit, enhancing the use of the ICT and reducing corruption. This entry focuses on Fiji, Jamaica, and Mauritius for a number of reasons. Firstly, Fiji, Jamaica, and Mauritius are three small island developing countries; therefore, it is easier to compare findings across these three countries. Secondly, there are hardly any comparative studies undertaken on NPM, corruption, ICT use, and budget deficit in the small island developing countries. This study aims to share cross country experiences in order to understand the success and failure of reforms across different geographical regions.

This entry is organized as follows. Section "Overview of Corruption, ICT, and Budget Deficit" provides overview of corruption, ICT use, and budget deficit in Fiji, Jamaica and Mauritius. Section "Economics of Corruption, ICT Use, and Government Budget Constraint" presents the analytical framework outlining the economics of corruption, ICT use, and government budget constraint. Section "New Public Management

(NPM), Corruption, Information Computer Technology, and Budget Deficit" discusses the New Public Management (NPM), corruption, information computer technology, and budget deficit concerns associated with the small island developing countries. Section "Reasons for the Ineffectiveness of the NPM Reforms in Fiji, Jamaica, and Mauritius" presents the reasons for the failure of public sector reforms in the small island developing countries. Section "Policy Implications" provides a number of policy implications in this study; finally, section "Conclusions and Directions for Future Research" outlines the conclusions and future directions of the research.

## Overview of Corruption, ICT, and Budget Deficit

Fiji is one of the most developed countries in the Pacific Island Countries. The Fiji group comprises of two major islands. These two islands are Viti Levu and Vanua Levu (Fiji Bureau of Statistics 2011). The major land owning unit in Fiji are i-Taukeis (87.9%), followed by state (3.9%) and Rotuman's (0.3%). Fiji has a total population of 837,271 (Fiji Bureau of Statistics 2011). There are two major ethnic groups in Fiji; namely, i-Taukeis and Indo Fijians (Fiji Bureau of Statistics 2011). In 2011, Fiji recorded a growth rate of 2.7%. This growth rate increased to 3.8% in 2014 (World Bank 2015a). Fiji's increase in imports and poor performance of the export sector is one of the reasons for trade imbalance. Tourism and remittances are the two largest foreign exchange earners (Central Intelligence Agency 2015).

Jamaica is an island nation located in the Caribbean Sea. This island nation comprises 10,831 sq. km of land mass and 160 sq. km of sea (Government of Mauritius 2015). The majority ethnic groups in Jamaica are "blacks" comprising 92.1% of the total population followed by East Indian and minority groups that comprise 7.9% of the total population (Government of Mauritius 2015). As compared to Fiji and Mauritius, Jamaica has the lowest growth rate. The economic growth rate of Jamaica decreased from 1.7% in 2011 to 1.3% in 2013 (World Bank 2015a). Similar to Fiji, Jamaica's economy also relies heavily on the service sector. The service sector contributes more than 70% to Jamaica's GDP (Central Intelligence Agency 2015).

Mauritius is located in the Indian Ocean, around 2000 km from the African landmass (Lee et al. 2013). Similar to Fiji, Mauritius is a multicultural society. The island nation of Mauritius comprises of 2030 sq. km of land mass and 10 sq. km of sea. There are four key ethnic groups in Fiji. These four are Indo-Mauritian, Creole, Sino-Mauritian, and Franco-Mauritian. As of July 2015, the total population of Mauritius is estimated to be 1,339,827 (World Bank 2015b). Unlike Fiji, Mauritius has greater political stability. Mauritius continues to flourish even in the environment of business uncertainty. The economy of Mauritius has recorded positive growth rate. The growth rate of Mauritius decreased from 3.9% in 2011 to 3.6% in 2014 (World Bank 2015a). Economic inequality is staggering in Fiji and Jamaica but to a lesser extent in Mauritius. Mauritius's economy is reliant mostly on sugar, textiles and apparel, tourism, and other service sector (Central Intelligence Agency 2015).

### Corruption in Fiji, Jamaica, and Mauritius

According to the Transparency International (2013), Fiji generally ranks below the global average of its corruption indices. Statistics published by the Transparency International show that citizen's perception of corruption in Fiji are evenly distributed among citizens who believe corruption has increased in Fiji and citizens who believe corruption has decreased in Fiji (Transparency International 2013). Similar to Fiji, Jamaica is also ranked below the global average of its corruption indices. The illegal means of bribery has become a culture in many public sector organizations. Jamaica has a long history of the relationship between criminal gangs and public sector officials. Even though Jamaica has political democracy, there is history of electoral related unethical behavior that is used by parties in destructive competition (Bogicevic 2012). As compared to Fiji and Jamaica, Mauritius has relatively low levels of corruption. In the recent decade, the government of Mauritius has placed

more emphasis on reducing corruption. According to the Transparency International (2014), 3.9% firms in Mauritius have encountered bribery demands of public sector officials whereas the Sub-Saharan average is 22.9%.

Figure 1 shows that Fiji's corruption index has increased from 70 in 1995 to 80 in 2014. Corruption index further declined from 80 in 2014 to 77.7 in 2015. Jamaica's corruption index increased from 50 in 1995 to 62 in 2015. The corruption index for Mauritius decreases from 50 in 1999 to 48 in 2015.

### Internet Use in Fiji, Jamaica, and Mauritius

Fiji, Jamaica, and Mauritius resemble similar trends in internet technology use. Approximately half of the total population in Fiji, Jamaica, and Mauritius are using internet services. There are many reasons why people use internet in these three countries. Some of the reasons are leisure, travel, e-government services, and educational purposes (Global Investment Centre 2015). In Fiji, the internet is mainly accessible to people living in urban areas and accessibility of internet in rural areas is constraint by the high cost of internet use and poor network availability (Global Investment Centre 2015). In the Jamaican context, the government has invested in ICT expansion, as a large proportion of the population are in the 10–29 year age group and these youngsters are more likely to use the internet (Kelly 2007). According to Dirooven (2013), internet subscriptions in Mauritius have drastically increased to 568,700 of the total population. Prices on the internet have also decreased in Mauritius (Kelly 2007).

Figure 2 shows that internet use in Fiji as percentage of the total population increased from 1.50% in 2000 to 41.80% in 2014. Internet use in Jamaica has increased from 3.12% in 2000 to 40.50% in 2014. Internet use in Mauritius increased from 7.28% in 2000 to 41.44% in 2014.

### Budget Deficit of Fiji, Jamaica, and Mauritius

As compared to Mauritius, the budget deficit of Fiji and Jamaica has been highly volatile with sharp increase and decrease in the budget deficit in every 2–4 year period. In 2015, the government of Fiji is projecting a higher budget deficit of around 2.5% of GDP (Asian Development Bank 2015). In comparison to Fiji and Mauritius, the budget deficit of Jamaica is much higher. The budget deficit of Jamaica decreased from 10.6% of GDP in 2009 to 6% of GDP in 2011 (Johnston and Montecino 2013). In the recent decade, the

government of Mauritius has been emphasizing on economic stability while announcing its budget. During last year's budget announcement, it was projected that the economic growth rate of Mauritius will be around 4% and budget deficit around 3.2% of GDP (KPMG 2013).

Figure 3 shows that the budget deficit of Fiji as percentage of GDP declined from 2.6% in 2013 to 1.9% in 2014. The budget deficit of Jamaica decreased from 5.9% of GDP in 2011 to 4% in 2012. The budget deficit of Mauritius decreased from 1.1% in 2011 to 0.6% in 2012.

## Economics of Corruption, ICT Use, and Government Budget Constraint

This study uses the Constant Elasticity of Substitution (CES) production function polarized by Devarajan et al. (1996), Ghosh and Gregoriou (2008), and Beladi and Oladi (2015) in order to explain the impact of corruption and ICT use on budget deficit. Assuming that there are two forms of government spending and integrating this with the CES production function, Eq. 1 is derived (Ghosh and Gregoriou 2008):

$$\varphi = \left(\omega k^{-\tau} + \delta g_1^{-\tau} + \theta g_2^{-\tau}\right)^{-1/\tau} \quad (1)$$

In Eq. 1, $\varphi$ is output, k is privately owned capital, $g_1$ is government expenditure one, and $g_2$ is government expenditure two. In Eq. 1, the following conditions need to be satisfied. First, ω should be greater than 0. Second, δ should be bigger than or equal to 0. Third, θ should be bigger than or equal to 0. Fourth, ω, δ, and θ should add to one. Fifth, τ should be bigger than or equal to −1. The function of government budget constraint is given in Eq. 2 (Ghosh and Gregoriou 2008):

$$\gamma = \mathrm{f}\ (\mathrm{G}, \mathrm{S}) \quad (2)$$

In Eq. 2, G is government expenditure that is divided into $g_1$ and $g_2$. Further, S is budget surplus or deficit and γ is government revenue. The share of the tax revenue that will be allotted to $g_1$ and $g_2$ is given by Eqs. 3 and 4 (Ghosh and Gregoriou 2008):

$$g_1 = \pi\gamma \quad (3)$$

$$g_2 = \beta\gamma \quad (4)$$

where $\pi + \beta = 1$.

The government's budget constraint expanded from Eq. 2 is given below:

$$g_1 + g_2 = \gamma \quad (5)$$

Following the studies conducted by Arin et al. (2011), Eq. 5 is modified in order to capture the effect of corruption on $g_1$ and $g_2$. There are two important issues that need to be considered when examining the relationship between corruption, ICT use, and budget deficit. First, corruption brings inefficiency in government spending as corruption causes leakage in the fiscal policy transmission mechanism. (Leakage is caused by the corrupt officials.) For instance, if government has allocated US$1,000,000 for government spending in the coming period and 10% of this is siphoned by corrupt government officials, then the actual government spending on the economy will be US$900,000 (Delavallade 2006). Second, with the use of ICT, corruption level can be effectively monitored and reduced. ICT use brings transparency, accountability, and reliability in delivery of public sector services (Proskuryakova et al. 2013). These two issues are captured in Eq. 6:

$$\frac{\partial g_1 + \partial g_2}{c} = \gamma \quad (6)$$

In Eq. 6, $\partial$ represents information computer technology and c represents corruption. The impact of corruption and ICT use on budget constraint line is shown in Fig. 4. It also shows that the leakage from government spending will reduce government spending but with the increased level of ICT use, the budget constraint line will adjust to its original level.

### Oligarchs Utility Function and Budget Constraint Line

Parallel to the arguments of Beladi and Oladi (2015), this project assumes that the economic system of a country is corrupted by unethical agents called "oligarchs." The utility function for oligarchs is given as follows:

$$U = \int_0^\infty \frac{\forall^{1-\sigma} - 1}{1 - \sigma}\, e^{-\rho t}\, dt \quad (7)$$

In Eq. 7, ∀ is private consumption and ρ is time preference (ρ > 0). The oligarch's budget constraint is given by:

$$\emptyset = yc - \forall \quad (8)$$

In Eq. 8, ∅ is budget constraint for oligarch, y is income that increases by the amount of leakage from corruption, and ∀ is private consumption.

N

**New Public Management, Corruption, Information Computer Technology, and Budget Deficit: Fiji, Jamaica, and Mauritius, Fig. 4** Corruption, ICT use, and budget constraint line. (Source: Created by the Author of this Project (2015) by using her own economic intuitions)

**New Public Management, Corruption, Information Computer Technology, and Budget Deficit: Fiji, Jamaica, and Mauritius, Fig. 5** Oligarchs utility function and budget constraint line. (Source: Created by the Author of this Project (2015) by using her own economic intuitions)

Fig. 5 shows that the unethical government official will be able to maximize his/her utility from the additional income he/she gets from corruption.

Drawing from the study conducted by Devarajan et al. (1996), the ratio of government spending to private capital derived from Eq. 1 is given below:

$$\frac{g}{k} = \left[\frac{c^{\tau} - \delta^{-\tau} - \theta\beta^{-\tau}}{\alpha}\right]^{1/\tau} \tag{9}$$

The endogenous budget deficit framework is given in Eq. 10 (Ghosh and Gregoriou 2008):

$$\vartheta = \frac{(\propto ?(1-c)\{\alpha c^{\tau}/[c^{\tau} - \delta^{-\tau} - \theta\beta^{-\tau}]\}^{-(1+\tau)/\tau} - p}{\sigma} \tag{10}$$

This section has developed the endogenous budget deficit framework that is linked to government spending, corruption, ICT use, and budget deficit. The impact of corruption and ICT use is clearly related to budget deficit. There are crucial implications on budget deficit as ICT use and corruption level fluctuates.

## New Public Management (NPM), Corruption, Information Computer Technology, and Budget Deficit

Effective financial resource management has always been the center stage of the NPM-driven reforms. The traditional model of public management has numerous loopholes that have resulted in ineffective budgeting, human

resource management practices, and public sector service delivery management (Devarajan et al. 1996; Delavallade 2006). When ineffectiveness constraints the growth of the public sector, it is natural that wastage of resources, low levels of employee productivity, and morale will become a major constraint to public service delivery. According to Bogicevic (2012) and Lukea Bhiwajee and Garavan (2016), when ineffectiveness constraints the growth of the public sector, the budget deficit and corruption are likely to increase. By early 1990s, the World Bank and International Monetary Fund who are the donor agencies of the small island developing countries enforced the need to reform the public sector in order to qualify to receive the financial resources for public sector management (Lukea Bhiwajee and Garavan 2016). Many small island developing countries are pressured to reform their public service delivery in order to secure funds from the IMF for the public expenditure (Lukea Bhiwajee and Garavan 2016). A common phenomenon in both large and small island developing countries is that governments usually spend more than their internal available financial resources. To address their budget deficit, they have to take loans with interest. The high level of interest payments, coupled with issues related to corruption, inefficiency, lack of employee morale, and productivity leads to accumulation of the budget deficit (Devarajan et al. 1996; Delavallade 2006). Fiji, Jamaica, and Mauritius together with other large developed, developing, and small island developing countries are affected by the new conditionality's of the IMF and World Bank (Bogicevic 2012).

There were a number of factors that constrained the ability of the small island developing countries to maximize the utility of funds received from the donor agencies (Devarajan et al. 1996; Delavallade 2006; Bogicevic 2012). Firstly, high levels of corruption in countries like Fiji and Jamaica inhibited the effective utilization of the donor agency funds. Most of the funds disbursed to the small island developing countries were for improving the transparency and accountability of the public sector, human resource development, effective financial management, and process reengineering. The high level of corruption restricted the maximum use of the donor agency funds for reducing the budget deficit of the public sector. For instance, Fiji had scored highest as compared to Mauritius and Jamaica on the Corruption Index. In order for Fiji to qualify for the disbursement of the donor agency funds, it will have to reform its public service delivery. Secondly, the high levels of budget deficit have become a growing concern not only for the small island developing countries, but also for large developed and developing countries as well. The Asian Financial Crisis, Latin American Debt Crisis, and the Global Financial Crisis showed how vulnerable the largest developed and developing countries have become as a result of accumulating large amounts of public debt (Lukea Bhiwajee and Garavan 2016). It has been noticed that most governments has been spending far more than they should be spending and resultantly both the future and the current generation is troubled with the accumulating debt. The current generation is less troubled with this accumulating debt as compared to the future generating because the longer it takes for the government to pay for the debt, the higher the interest rate and debt accumulation. As compared to the three countries, the budget deficit of Fiji is the highest followed by Mauritius and Jamaica. The public sector reforms in these three countries are indicative of the following issues (Devarajan et al. 1996; Delavallade 2006; Bogicevic 2012; Lukea Bhiwajee and Garavan 2016):

- The high level of the budget deficit and corruption levels in countries like Fiji and Jamaica can become a very serious problem if no action is taken.
- The big size of the government is a serious concern in the small island developing countries. There are few small island developing countries where the government is the major employers of more than 60% of the population. The small island developing countries are interdependent because the government is not promoting the growth of private sector activities in order to engage the population in

research and development activities. It is important for the government officials in the small island developing countries to realize that the role of the government is to provide employment and reduce unemployment rate. The role of the government is not to provide employment to the majority of the citizens in the government departments in order to reduce the employment rate.

Essentially, it is important for the government officials in the Fiji, Jamaica, and Mauritius to realize that the role of the NPM-driven reforms is to achieve a perfect balance between the economic and social development. Fiji, Jamaica, and Mauritius are open economies; therefore, it should be noted that the structural adjustments will be ineffective until it is supported by the public policy. There are a number of reasons for the ineffectiveness of NPM reforms in countries like Fiji, Jamaica, and Mauritius (Devarajan et al. 1996; Delavallade 2006; Bogicevic 2012; Lukea Bhiwajee and Garavan 2016). Firstly, the governments has always given importance to the social policy over fiscal policy contraction. The overall idea of the NPM model is to improve the efficiency of the public sector so that the public sector is able to create a worthwhile business environment for the private sector (Lukea Bhiwajee and Garavan 2016). This will have a multiplier effect on the private sector because as the efficiency of the private sector improves, there will be more room for entrepreneurship, new business start-up, etc. This will generate employment opportunities for the citizens of the countries. Secondly, the small island developing countries are still in the process of slowly adopting digital technology. Digitalizing the government processes is a way to improve the accountability and transparency of the government system (Lukea Bhiwajee and Garavan 2016). It is very difficult for citizens to use digital technology in order to use the government services in the small island developing countries. Fiji and Jamaica are still struggling with issues of lack of trust on the e-government website, and poor internet infrastructure.

Moreover, achieving the best fit between the NPM reforms, social policy, and fiscal consolidation would require a good knowledge of intellectual foundations, the specific types of fiscal assistance needed, and the best way to reduce public expenditure in order to reduce public debt. The NPM model specifically emphasizes on "achieving value for money" (Devarajan et al. 1996; Delavallade 2006; Bogicevic 2012; Lukea Bhiwajee and Garavan 2016). The political ideologies of the public sector, government influences how and what they see in value for money. For instance, for a right wing government, the value for money is achieved by investing in the private sector, while for the left wing government the value for money is achieved by investing in the social assistance program. Before the 1980s, the public sector of Fiji, Jamaica, and Mauritius has always emphasized on red tapism, bureaucracy, and rules-driven approach. However, under the NPM model, the public sector of Fiji, Jamaica, and Mauritius is required to be (Lukea Bhiwajee and Garavan 2016):

- Results orientated with specific emphasis on quality of service, efficiency and effectiveness
- An approach for providing feedback to clients
- A strong emphasis on clients
- Flexibility and cost effectiveness of public provision
- Transparency and accountability while establishing the public sector processes

## Reasons for the Ineffectiveness of the NPM Reforms in Fiji, Jamaica, and Mauritius

There are a number of reasons for the ineffectiveness of the NPM reforms in the small island developing countries, such as, Fiji, Jamaica, and Mauritius (Devarajan et al. 1996; Delavallade 2006; Bogicevic 2012; Lukea Bhiwajee and Garavan 2016). Firstly, NPM was treated as a universal approach of implementing reforms globally. The socioeconomic context of the small island developing countries is different and this is one of the main reasons for the failure of NPM

reforms in reducing corruption and the budget deficit as it was expected when this model was implemented. The NPM-driven reforms in the case of Fiji, Jamaica, and Mauritius should have been designed to suit the unique public sector problems that are faced by the public sector of these three small island developing countries (Lukea Bhiwajee and Garavan 2016). Secondly, the public sector officials lack the skill and the required capacity to implement public sector reforms in the developing countries. In order to implement successful reforms, the public sector officials need to be well trained in the area of process re-engineering, public policy, etc. There is a major skill gap noticed in countries such as Fiji and Jamaica. Mauritius is not an exception to this case, but there still needs to be improvements in the area of human capacity development in the public sector of Mauritius (Lukea Bhiwajee and Garavan 2016). Thirdly, too much internal bureaucracy in countries like Fiji and Jamaica makes it difficult to implement NPM model.

## Policy Implications

There are a number of policy implications of this study. Firstly, the governments of the small island developing countries should realize that is no one fit reform model in the world. A global-driven reform by donor agencies may not be successful all the time as locally driven factors should be considered when implementing reforms. A number of national factors affect the effectiveness and success of reforms in the small island developing countries and some of these factors are as follows (Devarajan et al. 1996; Delavallade 2006; Bogicevic 2012; Lukea Bhiwajee and Garavan 2016):

- Economic factors
- Political factors
- Social factors

The abovementioned factors should be considered while reforming the public sector of the small island developing countries. Secondly, an unsuccessful reform strategy will further exacerbate the existing problems faced by the public sector of the small island developing countries. It is imperative for the government officials to determine the best reform model that has the drive, commitment, and abilities to provide a perfect fit between the public sector resources and the re-engineered processes proposed by the reform model.

## Conclusions and Directions for Future Research

The main aim of this entry was to determine how high levels of corruption faced by the small island developing countries can be a major deterrent to the budget deficit position of these countries. Countries like Fiji and Jamaica can learn from Mauritius on the importance of engaging information computer technology (ICT) in the public sector reform process. The NPM reform model, driven by the donor agencies, has received numerous criticisms in the existing literature. With the recognition of these issues, this book entry tries to emphasize how the small island developing countries can learn from this these models and propose models that would prove successful in their socio-economic context.

## Brief Definitions

| | |
|---|---|
| New Public Management | A set of management techniques and practices derived from private sector to improve public sector management and service delivery |
| Public sector reform | Capacity building, control of corruption, and political |

| | |
|---|---|
| | decentralization and devolution |
| Management decentralization | Providing line managers with greater managerial authority and responsibility. |

## Introduction

New Public Management (NPM) is a set of management practices that are designed to improve public sector management, is sourced from the private sector, and is arguably the most influential public-sector reform paradigm in the last 30 years (Pollitt and Bouckaert 2004). Since NPM reform was originally conceived for and applied in developed countries, it cannot be assumed NPM is universally applicable and suitable in achieving the desired results in developing countries (Minogue 2001).

Extant literature reports various preconditions, challenges, limitations, and unanticipated consequences of NPM when introduced in developing countries (Brinkerhoff and Brinkerhoff 2015). In most instances, prescriptive NPM reforms in developing countries have been counterproductive resulting in reform failure. While policymakers in donor agencies and governments have promoted the "one-size-fit-all" reform program, this is perceived as misleading considering the very different country environments. Not surprisingly then, authors like Gangte (2012) caution developing countries not to blindly follow developed countries' experiences since every country has its own unique context. Also, experts like Lapsley (2009) argue that considering the defective nature of NPM models, developing countries should be discouraged from importing NPM reforms.

## NPM

Faced with dynamic environmental changes, traditional public administration is increasingly criticized for: bloated government overconsuming resources, bureaucracy, inefficiency, corruption, lack of accountability, inflexibility, unclear separation of policy and administration, and disregard of citizen satisfaction. Such harsh criticisms, as well as the imposed prescription (by international donor and funding organizations) of NPM as a universal panacea for public service and civil society failures in developing countries, aided the rapid emergence of NPM in developing countries from the 1980s (Appana 2011).

However, NPM is merely a loose set of techniques; not a fixed package with a specific set of guidelines that should be followed precisely (Christensen and Laegreid 2016). It is rather an amalgamation of overlapping methods that could be adopted collectively or partially, in line with the particular needs and circumstances of each country. Debate is ongoing regarding the suitability of NPM reforms in principle, its universality, benefits, and disadvantages (Lapsley 2009).

## Take up of NPM by Developing Countries

Many developing countries have experimented with NPM reforms, employing NPM in parallel to traditional public administration organizational structures (Cheung 2011). However, the degree of take-up of NPM is difficult to discern, given there is no standard NPM model countries can adopt in totality. In addition, espoused take-up rates of countries vary according to the particular elements of the NPM menu adopted (Madimutsa and Pretorius 2017).

The most common and often the first stage of the public sector reform is the NPM initiative of privatization and downsizing. These initiatives are a typical part of economic adjustment programs (Brinkerhoff and Brinkerhoff 2015). Studies like that of Madimutsa and Pretorius (2017, pp. 288, 290) suggest "the public-sector workers in developing countries are more vulnerable to the effects of externally imposed NPM reforms, which include job cuts" particularly because of external financial aid which have such conditions attached. Workers as well as the public thus have no social or economic reprieve, leading to their

understandable resistance (Madimutsa and Pretorius 2017, pp. 291, 304).

Notwithstanding, a few developing countries have made serious attempts in experimenting with NPM initiatives, while others have been laggards. At best, its implementation can be described as patchy. Results relating to individual elements of the NPM menu in developing countries have been mixed and adversely affected by: the disparity between the demanding donor goals and reporting requirements, country capability, lack of political will, the degree of administrative difficulty, regulatory capacity, and other counter reform efforts (Brinkerhoff and Brinkerhoff 2015).

## Reforms that Run Counter to NPM

What is equally true is that other reforms do run counter to NPM (Christensen and Laegreid 2016). Whereas elimination or reduction of procedural controls over line-management is vital in a transition from accountability for inputs to results-based accountability, and a desired outcome of NPM reform, budgeting and financial control remain weak in most developing countries. While these functions are typically delegated to line agencies in such countries, these functions require strengthening, which usually result in centralization (Polidano 1999). What results are dichotomies because governments maintain a high degree of centralization in the public service; however, in parallel corporatize many functions to avoid the limitations of that centralization. What compounds these dichotomies in developing countries are the major aspects of public sector reform (capacity building, control of corruption, and political decentralization and devolution), that are totally unrelated to NPM, yet employed concurrently with NPM reform and can counter NPM (Polidano 1999). Peters (2017, pp. 608, 610) have questioned as well as "demonstrated that there are real challenges to introducing NPM in administrative systems that are not well institutionalized," which explains why NPM "continues to be challenged from a number of directions."

## Appropriateness of NPM for Developing Countries

Commentators question the appropriateness of NPM in developing countries. According to researchers like Lapsley (2009, p. 1), "NPM is often a cruel disappointment for governments." Foundational to the question of appropriateness of NPM is the acknowledgment that fundamental differences between countries and public sectors exists, and that these differences should be considered, understood, and ideally managed prior to the adoption of NPM. In short, developing countries have distinctive needs and limitations (Samaratunge and Hughes 2001). Governments may not be suitably equipped to adopt unfamiliar approaches, and the preconditions necessary for the reforms may also be absent (Gangte 2012).

Gangte (2012) cautions developing countries to not blindly follow developed countries' experiences, because every country has its own context and peculiarities. Researchers (Bale and Dale 1998; Samaratunge and Hughes 2001) argue that Western management models (like NPM) are unsuitable for developing countries as a result of the inherent differences in the operating environments of these countries. Minogue (2001) also contends that NPM models are flawed and should not be exported from developed to developing countries. Samaratunge and Hughes (2001) suggest that indigenous reform models which consider the specific country and its operating environment should be encouraged and could be more appropriate and effective.

## Preconditions Required for the Success of NPM in Developing Countries

Researchers (Bale and Dale 1998) argue that the preconditions for the public sector reforms of pioneers like New Zealand included a politically stable, neutral, competent, and rule-based civil service; well-developed private sector; minimum corruption; and sound legal practices for private contracts. Without the presence of a similar environment, "the applicability of these practices may be limited" (Bale and Dale 1998, p. 103). Other

researchers reinforce this argument and state that without having the basic requirements for reform in place, the cost of reform can outweigh the benefits (Pollitt and Bouckaert 2004).

It is difficult to determine whether NPM is totally irrelevant to developing countries, as some NPM approaches and techniques could be suitable for some developing countries. Singapore is a good example of the success of NPM in a developing country. Meanwhile, Bangladesh is an obvious case of failure resulting from the implementation of NPM in a country with unsuitable conditions. There are certain preconditions needed by developing countries prior to the application of NPM in order to obtain good and effective results. However, these preconditions alone are insufficient due to the existence of other important factors that have a powerful impact. While NPM offers an alternative to developing countries' failed bureaucratic model, it would be unwise to think NPM alone would be capable of overcoming the numerous problems of developing countries (Samaratunge and Hughes 2001).

## Other Factors Influencing Reform in Developing Countries

Developing countries experience some common challenges including instability, insecurity, poverty, governance crises, and dependence on developed countries. They also exhibit some common features including postcolonial countries, military interventions, fragile economies, and weak private sectors. These challenges and a number of other factors influence NPM reforms in developing countries (Bale and Dale 1998).

Additionally, the significance and impact of domestic politics ("bureaucracy") on public sector reform is acknowledged (Brinkerhoff and Brinkerhoff 2015). Cheung (2011) claims bureaucracy is both the problem and the solution, constitutes the paradox of the reform, and the solution lies in the problem. He also argues bureaucrats need to be "reformed" to enable and support reform, otherwise reforms may be "captured" by the bureaucracy. A delicate balance is required between the forces for change, stability, and autonomy.

## Public Sector Reform in Pacific Island Countries (PICs)

The majority of the fourteen Pacific Island Countries (PICs) gained independence in the 1970s. During the next decade, government expenditure as a percentage of Gross Domestic Product (GDP) grew to some of the highest rates in the world. This unfavorable trend was facilitated by an exceptionally high influx of aid funding and economic mismanagement, driving governments to fiscal crisis. Accordingly, a series of public sector and economic reforms commenced in the mid-1990s to address the fiscal crisis and to encourage continuous growth in the economies, resulting in a decade of reforms in the Pacific region (Duncan 2011).

Despite such efforts, PICs public sectors continue to be described as "too big" (Horscroft 2014, p. 12). "Reducing their size, it follows, would provide much-needed space for private sector expansion and result in higher levels of economic growth" (Horscroft 2014, p. 2). However, an enormous challenge for the public sectors of PICs is provision of service delivery in such isolated, diminutive, scattered, and divided states (Horscroft 2014). Public sector reform efforts are ongoing in PICs, are supported by incumbent governments but vary greatly in detail. These reforms have been driven by current or impending economic crises and slow economic growth. All PICs have been confronted with continual budget deficits. Some deficits have been uncontrolled, without contingency plans in place, resulting in major dilemmas for their respective governments, and adversely affecting public service delivery (Asian Development Bank 2009).

"The need for public sector reforms in the PICs are as compelling today as they were in the mid-1990s" (Rahman et al. 2013, pp. 984–985). An overview of the status of public enterprise reform of some PICs highlights rationalization of

state-owned enterprises is underway in Fiji, Samoa, Tonga, Tuvalu, and most other PICs. Privatization of public utilities and contracting out services is ongoing in some PICs with the Asian Development Bank's (ADB) assistance for privatization. Private sector development reform has also progressed well in many PICs with reforms of the legal business environments in Fiji, Marshall Islands, and Solomon Islands; and endeavors to address economic uses of land ongoing in Federated States of Micronesia, Fiji, Marshall Islands, Samoa, Tonga, and Vanuatu. Downsizing of the public sector and reduction in public sector expenditure continues in Cook Islands, Fiji, Federated States of Micronesia, Solomon Islands, and some other PICs. Performance-based accountability has been implemented by Cook Islands, Fiji, Solomon Islands, Vanuatu, and a few other PICs in some of their agencies and enterprises. While the specific reform objectives vary country-to-country, a common theme is to more professionally manage limited resources (Asian Development Bank 2009).

Across all PICs, while the implementation of structural reforms has generally been a slow process (Asian Development Bank 2009), good responses to reform attempts have been evident in some PICs, with disappointing results in others (Duncan 2011). Clearly, many of the suggested preconditions for NPM are absent in all PICs. Hence, serious impediments to reform efforts persist, with reform progress retarded and sluggish. Further complicating NPM reform efforts are unrelated, major public-sector reform (capacity building, control of corruption, and political decentralization and devolution) employed in parallel with the NPM reform, and with the capacity to counter NPM reform (Brinkerhoff and Brinkerhoff 2015).

## Key Reform Challenges for PICs

A series of ongoing significant challenges confront PICs, as they pursue public sector reform. Major weaknesses in government policy formulation, analysis, and implementation, and lack of capacity for decision-making exist. This explains the piecemeal approach to and lack of sustainability of reform efforts in several PICs. Understandably, public sector reform implementations generally fail due to short-term aid funding programs; absence of clearly documented government priorities; lack of realistic, documented, properly sequenced implementation plans; and inadequate capacity building. Overwhelmingly, PICs have identified difficulties associated with sustaining reform efforts as a result of reforms being "imposed" by aid agencies; coordination between aid providers and aid recipient countries being inadequate; and the aid recipient countries not being allowed to drive reform efforts (Asian Development Bank 2009; Rahman et al. 2013).

## Public Sector Reform in Fiji

Fiji, like other post-colonial PICs, has been heavily dependent on its public sector for fiscal and socioeconomic growth, in support of nation building. The reform process commenced in Fiji in 1985, with actual reforms first introduced by the Fiji government in 1992 (Appana 2011). Researchers agree that overlapping internal and external pressures drove reform. Internal pressures stemmed from the need to address public enterprises that were not operating efficiently and effectively, an inability to stimulate private investment, and an absence of supporting policies and growth strategies (Rahman et al. 2013). External pressures emanated from globalization and donor agencies insisting on reforms (Rahman et al. 2013) due to sluggish economic performance and the need to disaggregate control of the public sector (Hook 2007).

Subsequently, Fiji launched two principal reform initiatives, namely, privatization of public enterprises and public service reform (performance-based management and change leadership) (Rahman et al. 2013). Deficient financial and governance frameworks and a shortage of staff experienced in the public sector reform frustrated reform efforts (Hook 2007). Dominant weaknesses in the reform process included: political instability, poor governance, inappropriate timing of reforms, absence of stakeholder

involvement, lack of institutional capacity, and scarcity of necessary resources. Hence, public sector reform in Fiji has generally been sluggish with mixed results (Reddy et al. 2004).

The Fijian government partially divested interest in a series of public enterprises, utilizing revenue to repay debts. Some Fijian public enterprises [for example, Airports Fiji Limited, Fiji Electricity Authority (now known as Energy Fiji Limited), Fiji Ports Corporation, Fiji Roads Authority and the Water Authority of Fiji] have shown promising results as they continue to undergo reforms. However, for some other public enterprises (for example, Food Processors Fiji Limited, Housing Authority, Maritime Safety Authority of Fiji and Fiji Rice Limited), progress continues to be sluggish and mixed. It is suggested that while NPM is a praiseworthy reform approach, it requires realignment with the Fijian context, otherwise it is highly likely mixed results in Fiji would persist.

Typical benefits achieved as a result of NPM reforms in Fiji remain somewhat latent and unrealized. Notwithstanding the unrealized benefits and the enormous reform challenges facing Fiji, the incumbent government's rhetoric and drive continues to be focused on improvements in the public sector resulting in better service delivery, reduced cost of operation of the public sector, improved pay and conditions for public sector employees, and higher dividend payouts, (Appana 2011). Additionally, the government suggests that with their "political will" that sets the course for and drives the reform, "indigenous ownership" and, a more integrated and holistic approach to reform, sustained reform that delivers desired outcomes is possible (Rahman et al. 2013).

## Conclusions

Perusal of extant NPM reform literature reveals many developing countries, selected PICs, and Fiji have imported an aid agency imposed NPM "blueprint" from developed countries. However, reform efforts have generally yielded mixed results. Other administrative reform efforts have also been run in parallel to the NPM reforms, therein countering NPM reform. Considering the country-specific peculiarities and preconditions required for success of NPM reform in developing countries, PICs and Fiji, and the enormity of the challenges, it would be remiss to suggest that NPM reform alone would be capable of overcoming those problems in the short term.

## Synonyms

Civil society; Community-based organizations; Nonprofit organizations

## Definitions

Nongovernment organizations are essentially nonprofit organizations that provide services and operate outside of the United States (Ott and Valero 2017). There are very slim differences between the two, with the most notable one being that NGOs must follow the laws of the country it is operating under when compared to US-based entities that follow US regulations. Nonprofit organizations, specifically, can be defined as entities that do not coerce participation, do not distribute profit to any one stakeholder, and often fail to have simple or clear lines of ownership and accountability (Frumkin 2002). Nonprofit organizations can be incorporated to serve a variety of charitable functions such as health and human services, education, the arts, and more.

Immigrant refers to individuals that relocate from one country to another. The case of South Korea has particularly seen two types of immigrants: labor immigrants and marriage migrants. Labor immigrants refers to individuals and families moving from their country of origin to another country in search for better economic opportunities (Goss and Lindquist 1995). Marriage migrants refer to individuals to enter arranged marriages with individuals in foreign countries (Lee 2003).

## Introduction

Historically, South Korea has been a highly homogenous population. This trend has changed, however, with the introduction of labor immigrants and marriage migrants into Korean society as well as increasing cases of illegal migration. According to data from the South Korean Government (2019) as shown in Table 1, there was a total of about 1.6 million legal foreigners who resided in South Korea in 2013. Additionally, a total of 183,106 illegal immigrants were counted as stepping into the boundaries of South Korea. These figures grew steadily over the next 4 years, with a total of about 2.2 million legal foreigners and about 251,041 illegal immigrants.

**NGO Immigrant Services: South Korea, Table 1** Immigrant population trends in South Korea

| | 2013 | 2014 | 2015 | 2016 | 2017 |
|---|---|---|---|---|---|
| Foreigners who reside in South Korea | 1,576,034 | 1,797,618 | 1,899,519 | 2,049,441 | 2,180,498 |
| Illegal immigrants | 183,106 | 208,778 | 214,168 | 208,971 | 251,041 |

*Source: South Korean Government, 2019*

When these immigrants arrive in South Korean soil, they are left needing services and supports that can help them both assimilate and receive assistance to survive in a foreign country. For example, in June 2018, immigrants and refugees captivated the attention of policy makers, citizens, and the media with the arrival of a ship of about 500 Yemeni refugees on South Korea's island of Jeju who were seeking immigrant status (Kang 2018). The South Korean government was taken by surprise and was not prepared to make policy or programmatic decisions. The extant research indicates that individuals and families who migrate to a new country are faced with numerous challenges and develop critical needs in order to integrate effectively to their new host country. These services and supports may include language learning, job training and opportunities, and housing – to name a few.

Nongovernmental organizations (NGOs) play a critical role in strengthening the economic, social, and political conditions of communities in all parts of the world and often fill gaps that are left unattended by government organizations and the private business sector. While the literature on nonprofit organizations and NGOs is well developed and documented in the United States and other parts of the world, the research and literature on NGOs in East Asian countries like South Korea is less extensive. Thus, this encyclopedia entry provides a brief introduction on Korean NGOs serving immigrant communities.

## Variety of Immigrants Entering South Korea

As the data points previously presented note, there are both foreigners who are residing in Korea who have maintained legal status as well as immigrants who are currently in illegal status. Illegal immigrants often include asylum seekers, refugees, and other immigrants who have either overstayed their visas or have failed to follow through the existing processes and policies of the South Korean government to achieve legal immigrant status.

In South Korea, there are largely two types of immigrants entering the country: labor immigrants and marriage migrants. Labor migration refers to individuals and families moving from their country of origin to another country in search for better economic opportunities (Goss and Lindquist 1995). According to Choi (2001), the year of 1990 marked a significant change in the South Korean economy with the transformation from a country that sent labor to other countries to one that actually received labor migration. Labor immigrants tend to be from the following countries: China, Vietnam, Indonesia, and the Philippines (Choi 2001).

Marriage migrants, on the other hand, refer to individuals to enter arranged marriages with individuals in foreign countries. In the case of South Korea, the majority tend to be women who plan to marry single South Korean men with compensation paid to intermediaries who help with the arranged marriage process (Lee 2003).

## NGOs in South Korea

The extant literature on South Korean NGOs has noted that Korea has an active civil society with organizations primarily focused on advocacy and leading social movements. Specifically, for much of the twentieth century, the primary role of NGOs in South Korea has been focused on issues related to fair and just elections (Isozaki 2002), the protection of animals (World Animal

Protection 2015), the rights of immigrant women (Choo 2013), democratization (Yoon 2018), improved healthcare (Sterkens 2018), and child adoption and child welfare (Rainbow Kids 2006). Advocacy has been key to helping Korean society improve for the betterment of communities and NGOs have helped individuals organize and provide direction in achieving positive change.

More recent research indicates that NGOs have also been increasingly involved in providing direct services to individuals and families with needs. According to the Johns Hopkins Comparative Nonprofit Sector Project, a significant number of organizations are service-oriented. Specifically, of the total civil society organization workforce, 41 % are involved in work related to education, 15 % related to social services, and 25 % related to health (Park et al. 1999). Kim and Kim (2015) note that the growth in NGO service provision and NGO growth in general has been in part due to interdependence theory effects or the reality that government funding of services that helped organizations grow and thrive.

## NGOs Serving Immigrants in South Korea

With the increasing number of immigrants coming into South Korea and the reality that these immigrants face a myriad of challenges, NGOs have stepped into a critical role of supporting these communities and securing resources to help these individuals and families assimilate into Korean society and achieve some level of success.

Valero et al. (2020) conducted a case study of 20 NGOs serving immigrants in Korea and relied on in-depth interviews with the leaders of these organizations in order to understand the extent of NGO services, successes of their migrant services, and the set of challenges they face as an organization in serving these immigrant communities. These interviews were coded using a structured thematic analysis process and these results are recorded in Table 2.

### Extent of Service Provision

NGOs in South Korea who serve immigrant communities provide a variety of services, from legal counsel to health care. According to Valero et al. (2020), the most common services provided are those that assimilate immigrants and refugees to Korean society and norms. Assimilation services include a variety of content such as native language courses, traditional Korean-style cooking

lessons, and counseling to support the family as they assimilate. These services are crucial to successful integration into Korean society as noted by an NGO leader:

> *We thought that they are not discriminated if they speak Korean, so we taught them the Korean language first. When we taught them how to speak Korean, we had to involve in the human right issues or labor rights.*

Assimilation programs receive the majority of government funding as they align with the desires of government. Therefore, services that go beyond assimilation have fewer government funding opportunities and less prevalence (Valero et al. 2020).

### Successes of NGO Migrant Services

In Korea exists negative public opinion of immigrants and refugees. NGOs who serve these populations report their greatest successes come from their work to change public perception of these groups. These changes in public perception of foreigners coming to South Korea are advancing the human rights for immigrants and refugees and helping create a more welcoming community (Valero et al. 2020). These successes also pave the way for future policy and resources for these groups. One NGO leader noted that immigrants should be considered members of their community and noted as follows:

> *Immigrants should be someone we interact with within our community. The environment that they can be members of society, not only people who receive help in a one way.*

### Challenges that NGOs Face

NGOs serving immigrants in Seoul experience funding challenges and resource scarcity, a familiar challenge NGOs face in many contexts. However, NGOs serving immigrant and refugee populations identify working with government agencies as their greatest challenge. The main aspects of government that create challenges are its hierarchical nature coupled with a prevailing lack of collaboration efforts with NGOs that are not willing to only carry out the government's agenda. As a result of this challenge, NGOs in Seoul understand if they want to have autonomy in their mission, they cannot rely on government support. For example, one NGO leader shared:

> There are disadvantages when we accept the government's offer. If we accept their offer, we cannot operate our organization in our unique way. If we get fund from the government, we have to run the organization in their way.

The absence of policy created by government entities that protects the rights of immigrants and foreign workers is another challenge NGOs face. This shows the lack of understanding the government has of hardships and issues facing immigrants in South Korea. Often, NGOs working across government agencies encounter a lack of consistent approach as noted by an NGO leader:

> *So government agencies but they have independent character therefore sometimes it's very difficult to clarify the case*

Valero et al. (2020) also found about half of NGOs interviewed felt there was a weak network between NGOs serving immigrants and refugees in Seoul. This weak network, coupled with the aforementioned funding challenges, results in disintegration of NGOs, who could benefit from collaboration and resource sharing. One NGO leader noted as follows:

> *If NGOs can work with us a bit more actively in the Multicultural Families Project, the budget itself can be a little raised and funded, so we can have more flexibility. So I was thinking how about giving a little support to blind spots in the government policies? If so, we could have added the roles of NGOs to our roles in the Center, and then we can reduce the blind spots of implementing the government policies such as immigrant women issues.*

## Conclusion

In sum, nongovernmental organizations (NGOs) in Korea play an important role in helping immigrants integrate into what has been largely a homogenous society. Immigrant serving NGOs provide a variety of services, although their biggest focus is on assimilation services in order for immigrants to thrive in South Korea. NGOs report facing significant challenges stemming from the lack of collaboration across the sectors and limited

resources for this policy arena. Ultimately, changing public perceptions and helping immigrant individual and families are the most important successes of these NGOs.

# NGOization

Theerapat Ungsuchaval
Faculty of Social Sciences and Humanities, Mahidol University, Nakorn Phathom, Thailand

## Synonyms

Depoliticization of social movement; Elite civil society; Professionalization of civil society

## Definition

NGOization refers to the process where non-governmental organizations (NGOs) and other civil society bodies are driven to become more professionalized, institutionalized, bureaucratized, and depoliticized and then to emphasize greater collaborative parentship with the state, upward accountability, and institutional advocacy.

## Introduction

The phenomenon that signifies the development of civil society organizations and non-governmental organizations (NGOs) from being movement-oriented turning to be a more professionalized and effectiveness-oriented group has been increasingly witnessed around the world since the 1980s. NGOs have been pressured to transform themselves to properly operate in the public space and prove their worth to donors and governments. Scholars conceptualized such the phenomenon as a part of NGOization of civil society, a transformation in NGOs' ecosystem that generates the preconceived idea of how civil society should be funded and operated.

For example, according to Choudry and Kapoor (2013), NGOization refers to the institutionalization, professionalization, depoliticization, and demobilization of civil society movements for social and environmental change. Lang (2013: 63–64) offered a more systematic account of the concept and argues that NGOization is:

> the process by which social movements [any collective endeavor to change the social structure] professionalize, institutionalize, and bureaucratize in vertically structured, policy-outcome-oriented organizations that focus on generating issue-specific and, to some degree, marketable expert knowledge or services.

From this regard, it can be argued that, for organized civil society to become NGOized is to become overemphasize with organizational reproduction, project management, the cultivation of funding resources, and institutional advocacy at the expense of public engagement and movement. In other words, NGOization drives NGOs to take on an inward-looking approach which impels them to prioritize their organization and to overlook a forward-looking approach that advocate them to make broader social changes.

NGOization does not only refer to changes in terms of organization and operation, but also the interaction NGOs have with other organizations such as public organizations, business organizations, and the public in general.

## NGO Funding and the Drive to NGOization

NGOization is caused. Research suggests that incentives and funding from "outside patrons" or donors can be considered as the key mechanism which promotes routinization and professionalization of civil society (Stone 1996; Guo 2007; Walker and McCarthy 2010). Donors are seen to have a significant influence over recipient NGOs as they can force NGOs to accept their agenda (Edwards and Hulme 1996; Lewis 2001). As pointed out by Aksartova (2009), NGOs under funding are tended to be constrained by "quantifiable indicators" of programmatic success created by donors as a part of performance measurement and public presentation of the donors themselves. Others stress the major role of government donors in shaping NGOs' autonomy, priority, flexibility, and accountability (Smith and Lipsky 1993; Salamon 1995; Froelich 1999).

Expansion of the funding base for NGOs over the last few decades through government contracting and corporate sponsorship is significant for contemporary civil society. NGOs are increasingly seen as an extended or shadow state functioning within the contract culture regulated by public funding (Wolch 1990; Smith and Lipsky 1993). When going into such a financial relationship, on the one hand, NGOs risk putting themselves in a vulnerable, dependent position allowing the intervention of the external patrons. Funding has not been merely an act of giving money but also about spreading donors' values and agendas. On the other hand, through the financial relationship, NGOs can gain legitimacy for public actions with the government. Eventually, NGOs find themselves being covered with an intense pull to professionalism, colonized by donors' ways of doing business, because they need to become a suitable and reliable partner of donors, especially the government. They are then influenced by innerorganizational processes to maintain their organizational reproductions.

The concern over donors' influence towards NGOs is known as the "piper hypothesis" which refers to the saying "the one who pays the piper calls the tune." By this, it means that NGOs are risking of losing their organizational autonomy and playing the funder's tune rather than their own when they obtain funding or become resource dependent on the funder.

Choudry and Kapoor (2013: 5) argue that to study NGOization is to:

> examine ways in which funding and other material support can orient organizations to prioritize institutional survival and maintenance at the expense of mobilization, and account for how NGO/movement actions may be shaped by material incentives.

Hence, the study of NGOization is commonly interested in donor-induced pulls for civil society to transform itself in terms of professionalization and institutionalization. Analytically, the strength

of the concept of NGOization lies in its power to give a theoretical basis to examine the way organized civil society and NGOs have been influenced by their donors in the modern world. Donors' capacities to control through funding and expectations are thus pivotal to the study of NGOization.

## Key Characteristics

NGOization unfolds and manifests differently in different contexts and cultures. Social origins of domestic ideas and practices of NGOs play a part in shaping NGOization of a certain society. There is no "Iron Law" of NGOization (Alvarez 2009).

Nevertheless, it can be argued that there are some major developments which characterize the process of NGOization in common. They are professionalization, institutionalization, bureaucratization, and depoliticization. It is imperative to note that these developments are not mutually exclusive. For instance, professionalization drives more institutionalization while institutionalization serves as a supportive base for professionalization. They have influences over each other.

### Professionalization

Professionalization is an intensifying push for civil society development commonly witnessed in many societies. It is a common strategy that allows the more technocratic control over organization which makes NGOs gaining an insider position at negotiation tables and in institutional decision-making settings (Clemens 2006; Lang 2013). Professionalization gives NGOs a kind of authority signifying institutionalized expertise. Such the expertise allows NGOs to adapt to institutional norms and to familiarize a certain policy field's language which in turn encourages them speak the same language as donors and in turn be reorganized to meet the need of them.

Characteristics of professionalized NGO working system are identified (Choudry and Kapoor 2013). For example, professionalized NGOs are highly equipped with modern management knowledge and practices. NGO activities rest in the hand of a small number of paid staff, who is running and representing organizational activities, because professionalization favors people with technical and managerial skills rather than those who have the spirit of an activist or a volunteer (Hopgood 2006). Professionalization drives NGOs to be more efficient and accountable in order to excel in organization governance over social movements. Accordingly, social change has become "highly specialized profession best left to experiences strategists, negotiators and policy wonks, [and] NGOism is the conceit that paid staff will be enough to save the world" (Reinsborough 2004: 194).

Yet, for NGOs to be professionalized means that they can be better recognized in both the public sphere and institutional arenas. This is because professionalism improves the legitimacy of NGOs while mitigates external criticisms (Caniglia and Carmin 2005). To put it simply, this helps increase the chance of NGOs getting funding.

### Institutionalization

Institutionalization refers to the process in which societies and organizations are "made" and "modified" over time by regulating societal behavior (Keman 2007). It aims to contribute to a system's stability. Minkoff and Powell (2006) even assert that organization survival rests extensively on conformity to institutional conventions.

Having contracts with donors and government bodies appears to be the urge for NGO to further formalize its organization and prioritization. According to Lang (2013), there are circumstances which drive NGOs to institutionalize. Institutionalization is needed when NGOs would like to build its organization a durable and endured institution. For instance, consistent norms, routines, and managerial bodies which are not relied on certain individuals are developed.

In addition, institutionalization is developed when NGOs would like to socialize with, and participate in institutional activities of, donors and governments. The higher the degree of institutionalization of NGOs, the higher the cooperation they have with governments and other organizations (Take 1999). This aspect of institutionalization comes with a situation where NGOs

are increasingly invited and expected to join and play multiple roles in social and economic development, nationally and internationally. In this regard, institutionalization makes NGOs become institutionally visible to and recognized by the authorities and donors as well as boosts their legitimacy in policy advocacy.

### Bureaucratization

Bureaucracy does not only involve governmental administration but private and nongovernmental governance as well as the society as a whole. It is a set of norms, rules, procedures, and formalities which goes beyond a mere hierarchical apparatus of the state (Hibou 2015). In fact, it is a system of administration found in any organizations, which is carried out on a continuous basis and based on prescribed rules, in order to pursue goals (Beetham 1996). Bureaucracy is then embedded in everyday practices, for instance, through the spread of manuals, kits, and guidelines.

In particular, Rothschild and Whitt (1986) clearly identify several characteristics of a bureaucratized organization, that is, an organization where: hierarchy and specialization through a secure division of labor function at least through virtue of incumbency in office and/or technical expertise; formalization of written charters and legal frameworks govern actions; centralization of control through standardized rules and supervision is the *modus operandi*; the personnel is impersonalized; and material incentives influence behavior rather than normative and solidarity-based ones.

There is a concern that although bureaucratization strengthens strategic effectiveness of NGOs, it does so at the expense of social mobilization (Jenkins 1983). NGOs are tended to develop their bureaucracy especially when they are in contract with government donors because they expect NGOs to establish formal accountability chains, work in accordance with prescribed rules, and keep records of detailed activities and financial transactions. Also, as suggested by DiMaggio and Powell (1991), organizations in certain field are subject to powerful isomorphic dispositions which then drive them to become more similar. NGOs under government contracts are then likely to adopt similar internal practices with those of the government and develop norms, procedures, and other shared professional standards guiding their conducts.

Besides, bureaucratization of NGOs paradoxically appears more when there is an attempt to reduce bureaucracy. Graeber (2015) calls this "the Iron Law of Liberalism": the situation where governance reforms are taken place to reduce governmental and bureaucratic interference in economy and society and to promote nonhierarchical forms of governing but, unfortunately and paradoxically, end up with increasing more regulations, paperwork, and bureaucratic culture. This idea suggests that the more the government tries to liberalize and deregulate policies towards NGOs, the more NGOs are put under government regulations. Bureaucratization is therefore a powerful force despite an attempt to reduce it.

### Depoliticization

In the context of NGOization, depoliticization refers to the detachment and the reduction of political activity, an endeavor to influence the decisions of the authorities on behalf of a collective interest, of NGOs (Jenkins 1987). It is to remove or restrict NGOs' capability to engage politically, either with electoral processes or implementation of public policy at any level. Depoliticization can also be regarded as the decrease of NGO dissent with the state.

Although public funding can generate benefits for NGOs in general, research found that the funding is negatively related with how NGOs are politically active (Salamon 2002; Smith and Pekkanen 2012; Bloodgood and Tremblay-Boire 2017). In other words, the greater the proportion of NGOs' budget coming from government sources, the less the role on lobbying and advocacy.

Depoliticizing effects of public funding are manifested through three interrelated mechanisms: selection, professionalization, and pressure (Bloodgood and Tremblay-Boire 2017). Firstly, institutional donors are tended to select and support "moderate" groups to prevent or reduce radical mobilization. Unsurprisingly, donors as the

resource provider and regulator hold the power to deter and moderate NGO advocacy. NGOs might also be reluctant to "bite the hand that feeds them" (Onyx et al. 2008). Secondly, funding potentially induces depoliticization by encouraging NGOs to become professionalized focusing on techniques and self-promotion rather than broader social change. Thirdly, donors, especially governmental ones, can channel NGO activity through creating "organizational fields" where the aforementioned isomorphic pressures are applied to impel NGOs to cooperate with the state and become isomorphic with each other.

Arguably, depoliticized NGOs are in danger of becoming the new attachment to the "anti-politics" machine of development (Ferguson 1994), a condition in which institutions, policies, and discourses associated with neoliberal ideas of self-interested individualism and market efficiency foreclose or discourage NGO engagement in politics and the public sphere. The condition of antipolitics in turn produces structural changes of NGOs, driving them to rely more on instrumental reasoning which ultimately helps reproducing the state power (Harriss 2001).

## Implications for Civil Society

NGOization reflects the characterization of organized civil society as an outrider of neoliberal ideology in modern society where the aforementioned professionalization, institutionalization, bureaucratization, and depoliticization are key principles of social organization. NGOization brings material and symbolic returns to NGOs (Lang 2013). Through material returns, NGOs can reach a better status which allows them to easier access funding and influence policy. Through symbolic returns, NGOs can get closer to donors or governments resulting in the strengthening of their connection and opening further windows of opportunity for NGOs to work within institutional settings.

Here, three major implications NGOization has for the transformation of civil society are discussed.

### Greater Collaborative Partnership Between the State and NGOs

NGOization encourages NGOs to develop their positive interaction with the state. In other words, it suggests the changing NGO-state relations characterized by greater collaborative partnership. The changing relationship heavily relies on the capacity of the state donor in drawing NGOs to function with government agencies. Besides, NGOs realize themselves that advocacy strategies typically involving protests and direct opposition are not welcome by government donors. Such a collaborative environment then transforms the working approach of NGOs to be a more professional but tamed civil society.

NGOization indicates a precondition for NGOs to engage in modern public governance arrangements where indirect coordinating instruments such as co-operative arrangements with nonstate actors and co-production are favored (see Pestoff et al. 2012).

Concerns were raised that such the greater collaboration might facilitate "manufactured civil society," or even "civic society," not civil society (Hodgson 2004; Huang and Young 2016), where the state sucessfully secures its influence over societal, nongovernmental bodies by making them become integrated into the state governance system. This civil society is not organic but engineered and funded through the state. This civil society is happy to confine itself to effective and efficient management and governance of communal matters, rather than challenging the political-economy structure of the state. Consequently, through NGOization, NGOs can become a legitimate actor of donors in public governance.

### Donor-Driven NGOs and Upward Accountability

Through NGOization, legitimacy from donors is prioritized over that from beneficiaries. In other words, NGOs might ultimately become more responsive to or compliant with their donors rather than their social bases. They become a memberless and donor-driven entity (Atia and Herrold 2018).

Arguably, NGOization reveals one of the basic truths about NGOs, that is, they are not only

working for their beneficiaries as commonly assumed, but they are also serving their donors and aiming to produce projects (Krause 2014). It can be said that NGOs are focused more on producing and completing their projects as a way to survive. Organizational reproduction became the default priority to NGO administration.

When donors have a great influence over the NGO recipients, upward accountability to donors is indeed expected. This points to the rise of elite civil society bodies that are upwardly accountable to donors and the state, not the people. NGOization creates the division of NGOs by legitimizing and privileging the ones that are happy to cooperate and compromise with donors and the state and excluding those who are not willing to do so (Carroll 2016). Such the elite civil society bodies, consequently, function with harmony and consensus with donors and the government. Sometimes, they even take on the position of middle-level manager and help donors to govern or regulate other NGOs, thereby becoming a part of the higher system that manages the lower system. They represent interests of donors and engage less with the public.

### Institutional Advocacy

Institutional advocacy is a mode of work which gives NGOs better access to institutional contexts and being competent and reliable experts in a particular public governance arrangement. It is an attempt to influence decision making by gaining insider positions in public governance arrangements which develop and implement policy or accessing career tracks in governmental agencies (Lang 2013). A "femocrat," an activist-turned-government officer advocating women's issues, is a good example of institutional insider for gender politics (Chappell 2002).

NGOization strengthens the application of institutional advocacy. Institutional advocacy encourages NGOs to sharing experience and knowledge, lobbying, and informal/internal consultation. It is different with public advocacy which aims to engage broader public engagement, communicate with the public, and stimulate social movement. In this sense, institutional advocacy compromises and nurtures the aforementioned elite civil society that has a capacity to connect with the authority and know the rules of the game behaving well in an increasing collaborative partnership.

Even though institutional advocacy can help NGOs to push their advocacy goals into inner orbits of policy decision-making, unfortunately, it can divert NGOs from their constituencies and social movement activities. It generates an image of expert, elitist NGOs which speak for, not engage with, the people. Moreover, it can give a tendency for NGOs to be opportunistic, being prepared to work with any government, even an authoritarian one, if it can help them reach their goals. NGOs then run a risk of co-optation.

## Conclusion

NGOization refers to the process where non-governmental organizations (NGOs) and other civil society bodies are driven to become more professionalized, institutionalized, bureaucratized, and depoliticized and then to emphasize greater collaborative parentship with the state, upward accountability, and institutional advocacy. It is inherently neither good nor bad. Indeed, the concept of NGOization can be used to comprehend the condition of modern civil society where funding is necessary to the development of civil society and organized civil society is impelled to transform itself to suit the funder. It helps reveal the changing relations between donors and NGO and poses a great challenge for NGOs to keep their balance between serving their donors and pursuing common interests.

## Definition

Governance of NGOs includes the process of developing strategic leadership in a nonprofit organization. This means setting the directions, making strategic decisions, evaluating the performance, and ensuring accountability and transparency.

## Defining NGOs

Nongovernmental organizations (NGOs) are not easy to define for at least two reasons. First, considerable differences exist from country to country. The word "NGO" itself addresses what NGOs are not, rather than what they are. Despite NGOs are "not governmental," the spectrum of the private configurations they may assume and the extensiveness of the control from the governmental sector vary based upon country characteristics. For example, the so-called government-owned nongovernmental organizations (GONGOs) in China well reflect that the definition of what is private and what is not depend on the country's history and the respective roles different societies assign to the state and the private sector in responding to the general interest. Second, despite the term would not suggest any specific sector or activity to which NGOs must dedicate their efforts, they are usually identified in practice as those nonstate actors providing health services, social services, or technical assistance in the field of international development or cooperation (Pfeffer and Gloyd 2008; Lewis and Kanji 2009).

Given these premises, NGOs are synonyms of civil society organizations (CSOs), third sector organizations (TSOs), or nonprofit organizations (NPOs), and for this reason, they can be defined by their structure and operations as associated to five distinctive characteristics (Salamon and Anheier 1992; Salamon and Sokolowski 2016).

First, they are *private* – meaning institutionally separated from government. This does not prevent the organization to gain support or in-kind contributions from the public sector to some extent or to have one or more representatives of public institutions in the board of directors or advisory boards. However, it means that they are not public bodies or public arm's length organizations.

Second, they are *organized* – meaning the organizations must be institutionalized to some extent. A charter or constitution typically exists, or at least rules of procedure, rules of membership, regular meetings, as well as the perception of meaningful organizational

boundaries (i.e., clear distinction between a member and a nonmember, the awareness of institutional and individual responsibilities).

Third, they are *voluntary* – meaning that the organization must involve some meaningful degree of voluntary participation. This means a degree of volunteers' engagement exists in operations or management, even if not the major presence, or in-kind donations or voluntary contributions apply to some extent to the organization. Voluntary is intended also as "noncompulsory": membership is not required and volunteering and donations are not enforced by law.

Fourth, they are *nonprofit* – meaning that any profit they may generate through commercial activities must be re-invested in the organization's mission. Typical examples are the profits generated from the sales of goods and products which are addressed to fund development projects in the same country.

Fifth, they are *self-governing* – meaning the organization must be equipped to control its own activities. There is a place where internal decisions are made (typically the board), there are internal governance procedures (which may be detailed in bylaws or sometimes codes of ethics or codes of conduct), and there must be a meaningful degree of authority in decision-making (even if members of public institutions or other private organizations sit in the board).

## Defining Governance in NGOs

Governance is a topic that rests on a plentiful literature from different streams and disciplines. Although different definitions can be found in the literature depending on the disciplinary angle – from international relation to political science, management, public management, and others – most definitions rest on three dimensions: authority, decision-making power, and accountability. According to the Institute of Governance, "*governance determines who has power, who makes decisions, how other players make their voice heard and how account is rendered"* (Institute of Governance 2017). Looking closely to nonprofit management literature, "*governance is the process of providing strategic leadership to a nonprofit organization*" (Renz 2007). Moreover, the literature suggests that the governance of an organization (usually called *corporate governance* for its origins rest on the study of corporations and firms) is the system by which the organization is directed and controlled: it specifies the distribution of rights and responsibilities among different stakeholders. In fact, governance is a political and organizational process involving multiple functions and engaging multiple stakeholders.

Ultimately, it is the application of *good* governance which serves to realize organizational and societal goals. In this respect, governance should entail at least four *functions*: setting directions, making political and strategic decisions, overseeing and monitoring the organizational performance, and ensuring overall accountability.

First, good governance aims at setting the mission and vision of the organization. The choice of the rationale of the organization, aims, and objectives are at the heart of the first function. For NGOs, it means exploring what societal needs they are aiming to address, what is the rationale behind the existence of the organization, and the reason behind their mission.

Second, the process of selecting among alternatives how the organization will try to achieve the goals above highlighted is at the core of making political and strategic decisions. In this function, who is in charge of governing will collect information from different stakeholders and use them to inform strategic and political decisions. Societal needs could be addressed with different strategies. Choosing the strategy for achieving the mission of the organization based upon reliable information deriving by stakeholders is the second function of the governance.

Third, the analysis of the results of activities is fundamental for ensuring the achievement of the mission. For a NGO, evaluating its intervention and activities means to analyze the contribution they achieve in a specific community. Exploring outputs, outcomes, and impacts and how they divert from the mission is at the core for analyzing organization success. Based upon the exploration of this result, who govern will change the strategy of the organization.

Fourth, good governance will support transparency and accountability towards all the stakeholders involved in the organization. A communication strategy towards public sector, citizens, beneficiaries, employees, communities, and private sector is organized. Outlining if and how the social mission has been achieved is at the core of creating a trust relationship with funders, communities, beneficiaries, and employees.

Aiming at applying good governance, different governors can be established as explored in the next section.

## The Board and the Board Members

Typically, the functions of governance are played by a steering committee, usually called the Board (the Board of Directors or Board of Trustees). A Chair or President and a number of board members typically form the board. In studying organizations, governance involves the study of boards and their members, distinguished by management, which involves the study of the executive management and staff. In some cases, the Chief Executive Officer (CEO), apical point of the executive management, is an *ex-officio* member of the board (a member admitted to discussions, but without voting power). Typically, every board gives itself rules for decision-making, which goes from consensus to majority.

It is important to note that while the functions of the board are basically the same in any organization, the size, composition, and internal rules may vary significantly. This variety depends on the legal form and the history of the organization.

Also the core responsibilities and tasks of board members are quite common between organizations.

According to Ingram (2008), board members have the core responsibility of (a) determine and articulate the organization's mission, vision, and core values; (b) recruit and select the organization's chief executive; (c) support and assess the performance of the organization's chief executive; (d) ensure that the organization engages in planning for its future; (e) determine the set of programs that the organization will deliver to implement its strategies and accomplish its goals and to monitor the performance of these programs to assess their value; (f) ensure that the organization has financial and other resources adequate to implement its plans; (g) ensure the effective management and use of the organization's financial and other resources; (h) enhance the organization's credibility and public image; (i) ensure organizational integrity and accountability; and (j) assess and develop the board's own effectiveness.

More varied are the "day-to-day" tasks of board members, especially because they strongly depend on the characteristics of the organization, as well as how structured or unstructured they are. According to BoardSource (Anheier 2014), some typical tasks are to attend all board meetings and special events, to always be informed about the whole organization, to review agenda and supporting materials prior to meetings, to serve on committees or task forces and offer to take special assignments, to suggest possible nominees to the board, to keep up-to-date on developments in the organization's field, to follow conflict of interest and confidentiality policies, and in general to assist the board in carrying on its specific duties (i.e., Reviewing the organization's annual financial statement).

Yet the typical board's work goes beyond that of governance. Board members typically serve also as ambassadors who build relationships and generate good will, sponsors and representatives who advocate on behalf of the organization, trusted advisors and consultants who offer guidance to chief executive and staff, and resource developers who help the organization secure essential resources.

## Types of Boards

As mentioned above, a wide variety of NGOs exist in different form – associations, cooperatives or foundations, just to mention three of the most common forms. Depending on the organization's form and structure, different type of boards may result more or less proper to pursue their

objectives. Five types of boards are common in nonprofit organizations (Worth 2013).

*Elected* boards are most common in membership-based organizations, such as associations, cooperative, or advocacy organizations. Members are typically selected through a voting mechanism from within the organization.

*Self-perpetuating* boards, instead, are typical in foundations, where there is no associational base. In this typology, board members leave the selection of new members to existing occupants of this role. In family foundations, boards are typically perpetuated through family members and based on a strong charisma and self-legitimization of the founder (Ricciuti 2015).

*Appointed* boards are composed of members selected by some authority outside the organization – for this reason, it is difficult to find pure appointed boards unless for very specific types of nonprofit organizations, such as universities, colleges, or churches.

*Hybrid* boards, more frequent, are a mix of elected or self-perpetuating boards and appointed boards; thus, they mix internal overview and external participation.

*Advisory* boards or councils, finally, are here mentioned although they do not substitute the board, but rather help it, that is, by offering expertise on technical issues.

## Conclusion

The literature on NGOs and governance is extremely varied both because complex is the definition of NGOs and because governance is a multifaceted concept studies by several disciplines.

There is no *golden rule* for the design of NGOs governance because it is dependent on the organization's history, tradition, composition, and legal form. Nonetheless, the literature on corporate governance helps defining the major traits of the governance of organizations that can be suitably adapted to NGOs, although with some caveats and considering specific peculiarities: social mission, accountability, private decision-making, and enlarged view of stakeholders.

[2]Polish Economic Society, Warszawa, Poland

## Synonyms

Crowding out volunteer work; Marketization; Mission drift; Nonprofits

## Definition

| | |
|---|---|
| NGOs' commercialization | shifting financial dependence from charitable donations to self-generated earned income through nonprofit organization ventures. |
| Mission drift | an inadequate situation for a nonprofit organization (NGO), in which the trade-off, required by the need to generate its own revenue or secure the funding from external sources, compromises the initial organizational objectives. |
| Crowding out volunteer work | weakening/decreasing engagement, retention, or motivation of volunteers by nonprofit organizations commercial activity. |
| Absorption trigger | a factor causing increased interest of volunteers in working for NGOs. |
| Distortions of NGOs stakeholder legitimacy | an inadequate situation for a nonprofit organization (NGO) of weakening stakeholders' identification with an organization. |

## Introduction

There is general agreement in the literature that voluntary work is of substantial economic value. In nonprofit organizations in particular, voluntary work is a critical resource and volunteer management is a central part of human resource management. Volunteer management is intended to increase the sum of services provided by volunteers and to improve the matching between the volunteers and the organization. Choosing a career in the form of volunteering seems to be something special. Many believe that this is due to exceptional sources of internal motivation, such as the need to be involved in public service. Over time, a better understanding of the purpose of the work only strengthens this individual motivation. However, this is best done in nonprofit organizations, whose unique culture and effectiveness in solving social problems offer a space where the team's pride mixes with their personal sense of achievement.

European research indicates that even though there has been a general increase in the number of active volunteers and voluntary organizations in the EU over the past 10 years, significant difficulties are observed. For example, 93% of respondents indicated that they have never volunteered abroad. The survey also suggests that more than half (54%) of the young people who had taken part in organized voluntary activities did not incur any expenses, a further 28% of respondents incurred expenses without receiving any compensation, and one in six respondents (16%) were compensated for their expenses. The main difficulties seem to be related to the changes that are affecting the nature of voluntary engagement. They are also associated with a mismatch between the needs of voluntary organizations and the aspirations of the new generations of volunteers, rather than a drop in the number of volunteers. Factors include inadequate knowledge of the needs of organizations, the difficulty in matching volunteers with appropriate organizations, preference for short rather than long-term voluntary commitments, and increases in the number of voluntary organizations resulting in volunteers being spread across an ever-larger number of organizations.

The decrease in the number of volunteers is particularly visible in the United States, where volunteerism plays a significantly larger role in American civic life than it does in other countries. Research indicates that Americans are 15% more likely to volunteer their time than the Dutch, 21% more likely than the Swiss, and 32% more likely than Germans. According to the Bureau of Labor Statistics, volunteerism peaked between 2003 and 2005. From this time, the percentage of Americans who report having volunteered decreased from 28.8% to 25.3%. The volunteering rate has slowly declined from 29% to 25.4% in just 10 years. It is widely acknowledged that the nonprofit sector must reverse these trends and do more to increase the engagement of communities. This is particularly necessary in the human services sector, which relies heavily on the support of volunteers to fill the gaps in federal,

state, and local funding. Volunteer indicators in the United States have been declining since 2010, as they have in Australia and Canada. The above numbers have raised concerns among researchers, and have prompted them to conduct research focused on finding the causes of this phenomenon.

From the perspective of nonprofit organizations, the role of the volunteer is particularly important, not only because of their complementarity with staff shortages, but also from the point of view of solicitude for a social mission. When nonprofit organizations engage in activities aimed at generating commercial revenue to provide additional funds for fulfilling their mission, they must at the same time take particular account of the perception of volunteers in order to avoid tensions. While paid staff might be market driven, volunteer motivations are social mission driven.

Although there is an intense discussion in the literature on nonprofit organization commercialization, which may trigger a variety of tensions in organizations (e.g., mission drift), so far, the problem of the influence of commercialization on voluntary work has been poorly verified empirically. Knowledge of the relationship between commercialization and the ability of an organization to attract volunteers is crucial for an NGO's performance. Even if the commercialization of nonprofit organizations does not crowd out volunteer work, and, contrary to the speculations of other researchers, does not cause significant tensions along with the resulting difficulties in retaining volunteers in the organization, it is necessary to find out which tools for motivating volunteers increase the probability of maintaining an appropriate level of volunteer retention in commercialized NGOs. Firstly, the question arises whether commercialization causes a crowding out or crowding in effect with regard to volunteer work. The second question is what factors affect volunteer work as part of an NGO's activity.

Answers to these research questions will improve knowledge about the sector and give an indication as to the way NGOs should develop, while also providing practical implications for their governance and operations. Thus, the aim of this entry is to identify whether the commercialization of NGOs influences the crowding out or crowding in effect with regard to volunteer work, and to indicate the factors that affect volunteers' regular involvement in an NGO's activity. The entry presents a hypothesis which assumes that commercialization of NGOs determines stronger voluntary work in the functioning of such NGOs.

To achieve the paper's aim, ANOVA analysis and logistic regression were carried out on 1300 NGOs, including 200 NGOs that conduct business activity.

## Tensions of Nonprofit Commercialization

Commercialization is the process in which nonprofit organizations engage in activities aimed at generating commercial revenues. As a response to institutional changes, the nonprofit sector is increasingly performing business activities, and adopting market values and methods in the process of managing and providing services. The purpose of the commercialization process is to strengthen the economic stability of the organization by obtaining revenues independent of funding from government and private donors. This is an attempt to adopt nonprofit market behavior. At the same time, it is the reluctant response of social organizations to falling revenues from public funds and private donors and to a change in the legal conditions in the nonprofit sector (Maier et al. 2016).

Nonprofit organizations usually complete their mission by financing their activities with funds from public subsidies or from individual and commercial donors. Their capabilities in this regard depend primarily on their reputation, reliability, and effectiveness. Hence, nonprofit organizations must rely on many different sources of support in order to successfully fulfill their social mission. Increasingly, these entities engage in commercial activities involving the sale of products and services. Therefore, in order to raise funds, they are combining social activity with economic activity (Mikołajczak 2019).

The essence of the NGO commercialization process is to build the economic stability of

the organization by becoming independent of subsidy-based and/or philanthropy funding, as well as by making changes in the area of organization management, emphasizing its entrepreneurship and self-sufficiency. In a broader sense, commercialization of the NGO sector is related to the state's social policy and the limited possibilities the state has of financing the activities of such entities (Kerlin and Pollak 2006). This is also determined by the growing number of people in need of support and the growing number of organizations competing for funding for their activities.

A literature search identifies several leading problems arising from the commercialization of nonprofit organizations. These mainly concern the tensions related to the impact of commercialization on mission drift, the crowding out of public aid and/or the activity of private donors through commercial revenues, as well as distortions in stakeholder perceptions of legitimacy.

The threats associated with mission drift arise from the danger of social activity becoming dominated by economic activity, and thus the transformation of a social organization into a commercial enterprise, to the detriment of the achievement of its social goals and values. The risk of departing from the organization's original primary mission to attract available funds and ensure financial stability arises when NGOs are starting to focus more on survival goals than on fulfilling their original mission. This problem arises in particular when NGOs engage in commercial activities.

In addition, commercial activity diverts the real attention of NGOs toward activities unrelated to their original mission, requiring the involvement of professional, technical, and personnel infrastructure (e.g., Ebrahim et al. 2014). Commercialization of the nonprofit sector may also stimulate the formation of NGOs that focus on strict program performance assessments, while reducing their involvement in direct activity focused on social change (Marshall and Suárez 2013). Therefore, commercial priorities can distract nonprofit organization managers from their key social missions, and sometimes even subvert those missions.

Commercialization critics also argue that when nonprofit organizations take on entrepreneurial behavior, they reduce the willingness of private donors to become active, thus weakening their ability to raise additional funds for the organization's mission. Other threats are associated with the effect of the crowding out of public aid by commercial activities (Mikołajczak 2018).

From a financial perspective, the dual nature of the activities of commercialized nonprofit organizations makes them use a wide spectrum of different sources of revenue, e.g., public subsidies, funds from private donors, or commercial sales of products and services. However, the requirement of cost internalization means that they generate lower profits than could have been generated if they assumed the full economic costs. Moreover, double-pricing strategies, which result in lower revenues, limit the competitiveness and attractiveness of commercialized organizations for financial institutions and social investors (. . .).

Controversies related to commercialization arise from the tensions created when organizations seek different and contradictory goals or try to meet the inconsistent requirements of many stakeholders (Smith and Lewis 2011). Aside from mission drift, stakeholder perceptions of legitimacy, and crowding out of public support, some researchers include in these tensions weakening retention of volunteers as a result of the process of nonprofit commercialization.

In an organization, the role of volunteer is particularly important, not only because of their complementarity with staff shortages, but also from the point of view of solicitude for a social mission. The reluctance to accept commercialization can affect both a volunteer's motivation and the relationship of volunteers with other staff. While paid staff might be market driven, volunteer motivations are social mission driven. For volunteers, a choice of career in the form of volunteering is something special (Austin et al. 2006). Many believe that this arises from exceptional sources of intrinsic motivation, such as the need to be involved in public service. Thus, market goals might be difficult to accept, and to some extent are a catalyst to the loss of volunteers' commitment to an organization. Moreover, unlike paid employees, who might be expected to comply with managerial demands, volunteers are free

to withdraw their labor if they disapprove of the strategic direction the organization is pursuing. Leaders responsible for managing a nonprofit organization must keep this in mind in order to avoid tensions between organization stakeholders with regard to leadership, employee relations, recruitment, and culture. They must also manage relationships between employees and volunteers in order to achieve retention of the latter at an appropriate level. A lot of analyses assume that, unlike paid staff, volunteers receive limited training, possess no disciplinary knowledge, and have little power even if their work has a crucial social impact. This may cause frustration and tensions.

## Crowding Out/In of Volunteer Work

### Public Support

When considering the effect of the crowding out of volunteer work, the crowding out of volunteers by public sector activity is emphasized. There are empirically identified three channels for the crowding out of voluntary labor. Firstly, an increase in public social expenditure decreases the probability that the individual will volunteer (fiscal crowding out). Secondly, political consensus between individuals and the government also induces volunteers to reduce their unsalaried activities (consensual crowding out). And finally, the more a government supports democratization, the lower the individual's engagement (participatory crowding out). Religiosity and a more unequal income distribution in a country increase individuals' willingness to volunteer (Hackl et al. 2012). Although there exists a large body of literature investigating the influence of government spending on volunteers' involvement in which empirical evidence on the crowding out effect is still ambiguous, there is very little research on the relationship of commercial revenues on determining private donations of time.

### Commercial Revenues

Noticeably, little research has been devoted to the relationship between commercialization and volunteer work. The impact of commercialization on voluntary work at the organizational level was explored in Norwegian voluntary sport organizations. There was assumed that commercialization may not crowd out voluntary work when it is used to generate commercial resources that in turn are used to produce mission-related good. If individuals value the collective good, volunteers have the incentive to contribute by working voluntarily. This situation should lead to a relationship where increased commercial income is associated with increased voluntary work. Thus, voluntary work constitutes an input for the generation of commercial income in Norwegian nonprofit organizations – voluntary work and commercial income are not substitutes but are complementary (Enjolras 2002).

Some research suggest that an NPO's (Nonprofit organization) marketization is associated with commercialization of relationships which may, but need not, involve the introduction of monetary exchanges, for instance, when volunteering becomes an instrumental exchange of work in return for personal gratification. However, at the same time NPOs may also become more business-like in their selection of personnel, which is reflected in the concept of professionalization. This may lead to consequences that range from raising volunteers' qualification levels to employing more paid staff and placing stronger emphasis on formal educational credentials (Maier et al. 2016).

Other research explored the causality between commercialization and organization performance (e.g., the ability to attract donors and volunteers). It was pointed out that commercial revenues do not make a significant contribution to the organization's ability to crowd in volunteers. At the same time, the effects of commercialization on the ability to attract and retain qualified staff differ between fields of activity, and have a positive outcome in human service NPOs (Guo 2006).

Other findings also indicate that commercialization is associated with the use of more paid work and unchanged amounts of voluntary work. However, it entails a qualitative change to volunteering, which means that volunteers are involved in ancillary tasks, whereas central tasks are performed by paid staff. There are also some proofs that there is a relatively small percentage of

volunteers who participate in commercial activities. The use of activities that are consistent with or advance the organization's mission is approved of, while the use of commercial activities that do not advance the mission is generally disapproved of (Geoghegan and Powell 2006).

## Research Methodology

The main hypothesis formulated was that the commercialization of Polish NGOs is associated with the crowding in effect on volunteer work. Data for the present analyses was acquired from the Klon/Jawor Association, which partly commissioned research for the Kantar Millward Brown company in 2018 to conduct a national survey on a representative sample of 1100 Polish foundations and associations. The research was carried out on a random group of associations and foundations drawn from the Polish Statistics REGON register. A CAWI study was carried out by the Klon/Jawor Association. The organizations selected for the study received emails inviting them to join the research, and were additionally reminded and encouraged to participate in the study by phone. Two hundred organizations in Warsaw were examined by Kantar Millward Brown on behalf of the office in the capital city of Warsaw (using the same questionnaire as in the CAWI survey).

The data concerning associations and foundations was collected by means of the interview method, which used two research techniques: (1) 1100 interviews were carried out employing the CAWI technique (through an online questionnaire completed by the organizations themselves. The CADAS technique was used for this study) and (2) 200 were carried out employing the CAPI technique (direct computer-assisted personal interviews, conducted by interviewers in the area). In both cases, the respondents were people performing key functions in their organizations. Therefore, the questionnaire was to be completed by the leader of the organization, a member of the senior management, or a member of the trustee board or management committee. The data was collected in compliance with the principle of confidentiality.

Contact details for the organizations were obtained from spis.ngo.pl, which was verified and supplemented with data available on the Internet and information from local proxies for NGOs. The CAWI survey was carried out between May and September 2018. The CAPI survey was carried out between October and December 2018.

To achieve the paper's aim, ANOVA analysis and logistic regression were carried out. To achieve the paper's goal in identifying differences in the functioning of NGOs that cause a crowding in or crowding out effect, a one-factor analysis of variance (ANOVA) was carried out. ANOVA analysis of variance is a statistical method used to study observations that depend on one or more simultaneously acting factors. This method indicates which factors can be the reason for differences between the group means observed.

In this one-factor variance analysis, distribution normality research was conducted with the help of a Kołmogorow-Smirnow test. For those variables which did not meet the distribution normality criteria in the analysis, a nonparametrical Kruskal–Wallis test was carried out. To check the assumption of variance homogeneity, a Brown–Forsythe (B–F) test was performed due to unequal group sizes. In cases where the variance homogeneity criterion was met, an F-test was conducted to assess the differences. In other cases, a Welch test was employed to calculate the averages. Dichotomic variables include social enterprises and NGOs that do not run commercial activities. At the same time, dependent variables were selected on the basis of a literature review. Dependent variables were marked from V1 to V3, characterizing volunteer involvement.

The logistic regression model developed for the purpose of this entry is aimed at defining the probability of an NGO's crowding in effect, depending on the five selected variables presented in Table 2. An attempt has been made to quantify and parameterize the likelihood of an NGO's crowding in effect occurring. Therefore, variables were used regarding the involvement of volunteers in NGOs in the survey. The possibility of predicting an NGO's crowding in effect was defined as the probability, on the basis of survey

results, of an NGO falling into one of two binary classes (0 – use of the work of volunteers did not take place, 1 – NGOs did use the work of volunteers).

To verify the main hypothesis assuming that the commercialization of Polish NGOs is associated with a crowding in effect on volunteer work, the multiple logistic regression model applied in the studies made it possible to determine the probability of belonging to one of the two classes. The multiple logistic regression method was used to assess the risk of an NGO's crowding effect, to indicate its determinants and to assess the impact of selected factors on the NGO's support for volunteers.

## Results

To identify differences in the crowding in or out effect of social enterprises or NGOs not performing business activity, a one-factor analysis of variance (ANOVA) was carried out. At the first stage, distribution normality research was conducted for all dependent variables, with a level of $p < 0.01$ reached in a Kołmogorow-Smirnow test, which gave grounds for rejecting the hypothesis about the distribution normality of the variables tested. As the condition of distribution normality for dependent variables was not met, a nonparametrical Kruskal–Wallis test was employed to compare average survey values. For the K–W test, the level of variable significance between V1 and V2 was smaller than $p = 0.05$, so grounds were given for rejecting the assumption of the lack of significant differences among average results between NGOs that perform and those that do not perform business activity.

To check the assumption of variance homogeneity, a Brown–Forsythe test was used due to unequal group sizes (200 NGOs conducting business activity and 1100 not doing so; data shortages were tackled by not including the NGOs concerned in the analysis). The assumption of variance homogeneity was not met for all variables ($p < 0.05$), and a Welch test was employed to evaluate averages. The variance analysis showed statistically significant differences in the way NGOs perform or do not perform business activity with regard to all variables (see Table 1).

To establish which factors are significant and influence the crowding effect, stepwise backward regression was carried out. The logistic regression analysis – where the explanatory variable was a binary variable, that is, the commercialization of nongovernmental organizations and the explanatory variables were public external financing, private external financing and private internal financing – indicates that all variables determine the probability of an NGO's commercialization. The model achieved the value of the $\chi 2$ test at the level of 20.37, with a $p$ value of 0.01, which means that it is statistically significant. The model also accurately reflects actual data (the

**NGOs' Commercialization: The Crowding out or Crowding in Effect, Table 1** ANOVA analysis

| Assessment category | NGOs conducting business activity | NGOs not conducting business activity | Kruskal–Wallis test Value | p | Welch test Value | p |
|---|---|---|---|---|---|---|
| | Average value | | | | | |
| V1: Participation of volunteers in the work of the organization | 69% | 61% | 8.06 | 0.01 | 8.76 | 0.00 |
| V2: Number of volunteers even once involved in the organization's activities in the last 12 months | 150 | 22 | 14.01 | 0.00 | 6.40 | 0.01 |
| V3: The number of volunteers involved in the organization's activities are involved in the work of the organization regularly and often (at least once a month) | 86 | 48 | 10.10 | 0.01 | 1.69 | 0.20 |

**NGOs' Commercialization: The Crowding out or Crowding in Effect, Table 2** Parameters of independent variables of the logistic regression model

| Assessment category | Coefficient | VIF | p | ORi |
|---|---|---|---|---|
| W1: Size of NGO | −0.088 | 1.09 | 0.18 | 0.92 |
| W2: Internal training – conducted by people from the organization | 0.994 | 1.18 | 0.00 | 2.70 |
| W3: External training – by people outside the Organization | −0.102 | −0.102 | 0.74 | 0.90 |
| W4: Conferences | −0.718 | 1.4 | 0.03 | 0.49 |
| W5: Consultations, consultancy, meetings with Specialists | −0.026 | 1.35 | 0.95 | 0.97 |

Hosmer–Lemeshow test indicates a $p$ value of 0.63). Therefore, the hypothesis that the commercialization of Polish NGOs is associated with the crowding in effect on volunteer work was confirmed.

The parameters of the variables obtained – the values of directional coefficients and related p values, the odds ratio, and the VIF coefficient – are presented in Table 2.

As part of the model, two variables were selected with reference to the likelihood of an NGO's crowding in effect, internal training – conducted by people from the organization – and conferences (their $p$ values are less than 0.05). Collinearity analysis suggested the lack of a problem of correlating independent variables, as the VIF factor for the variables was not greater than 1.40.

The model is therefore described by the following formula:

$$C = \frac{\exp(1.815 + 0.994\,W2 - 0.718\,W4)}{1 + \exp(1.815 + 0.994\,W2 - 0.718\,W4)},$$

where:

$C$ – probability of crowding in effect occurring,
$W2$ – internal training – conducted by people from the organization,
$W4$ – conferences.

The logistic regression analysis demonstrated that:

- Offering volunteers acquisition of knowledge inside the organization provided by internal training – conducted by people from the organization – caused an increase in the probability of an NGO's crowding in effect, as its directional coefficient is 0.994
- Enabling participation in conferences works in the opposite direction, resulting in a slight decrease in the likelihood of an NGO's crowding in effect, as its directional coefficient is −0.718
- It can be said that the size of an NGO, external training – by people outside the organization – and consultations or meetings with specialists do not influence the crowding out or crowding in effect, as the $p$ value is $>0.05$.

The model demonstrates that the likelihood of an NGO's crowding in effect increases with frequent internal training and decreases rapidly with providing participation in conferences, which works as an external knowledge transfer.

To verify the predictive power of the constructed probability model of an NGO's crowding in effect, the error matrix method was used, the results of which are presented in Table 3.

The number of true positive cases (TP) is 127 observations and of false positive cases (FP) – 53 observations. The number of true negative cases (TN) is 9 and of false negative ones (FN) – 11. To assess the model's predictive capabilities, the results of the error matrix and the following coefficients were used: precision (PPV), negative predictive value (NPV), likelihood ratio (LR), efficacy (ACC), sensitivity, and specificity. The results are shown in Table 4.

**NGOs' Commercialization: The Crowding out or Crowding in Effect, Table 3** Matrix of errors developed for model C

| Item | | Observed real classes | |
|---|---|---|---|
| | | Positive | Negative |
| Predicted decision classes | Positive | 127 | 53 |
| | Negative | 11 | 9 |

**NGOs' Commercialization: The Crowding out or Crowding in Effect, Table 4** Assessment of the model's predictive abilities

| Item | Value |
|---|---|
| PPV | 70.46% |
| NPV | 45.16% |
| LR | 1.08 |
| ACC | 67.95% |
| Sensitivity | 92.09% |
| Specificity | 14.43% |

The model correctly identifies two out of three NGOs (the accuracy of the PPV classification was calculated at 70.46%). The probability that the organization was classified as commercialized with a negative result is 45.16% (NPV). The ratio between the chance that a positive result of the C test will be achieved by NGOs from the group of those who have been commercialized, and the likelihood that the same effect will be observed among organizations that have not been commercialized is 1.08 (LR). The effectiveness of C (ACC) is 67.95%, which means that the model correctly shows 6 out of 10 cases of commercialized NGOs. The ability of the C test to detect commercialization in the analyzed group of commercialized organizations (sensitivity) is 92.09%. On the other hand, specificity, i.e., the ability of the C test to exclude noncommercialized organizations is 14.43%.

## Conclusions

Nongovernmental organizations operating in market conditions, like all other entities, must have financial resources enabling them to achieve their goals, maintain a paid platform, etc. These often turn out to be insufficient, which is one of the main reasons for nonprofit organizations starting in business. Its consequences are the subject of a wide discussion, one of the research directions being tensions resulting in nonprofit commissioning. This also applies to volunteering.

The results of this research indicate that in the case of NGOs conducting business activity, a statistically significant higher level of volunteering in general can be observed. This also applies to occasional volunteering, i.e., volunteers involved at least once in the organization's activities in the last 12 months. In addition, the analysis points to a statistically higher number of volunteers who during the last 12 months have been engaged in the work of an organization regularly and often, i.e., undertook activities for the organization at least once a month. Therefore, the research has confirmed the hypothesis that the commercialization of Polish NGOs can be associated with a crowding in effect on volunteering.

The crowding in phenomenon is conducive to offering potential volunteers internal training conducted by people from the organization. However, while offering volunteers the acquisition of knowledge inside the organization is interesting for them and encourages free work, enabling participation in conferences works in the opposite direction, causing a weakening of the volunteer's involvement. It can be said that the direction of knowledge transfer (inside or outside the organization through, for example, conferences) can be crucial in engaging volunteer work in NGOs. We called this phenomenon as knowledge sharing absorption trigger. The results of this study may confirm some process theory assumptions that indicate the effect of internal and external types of motivation. In this context, numerous researchers explain that the motivation of volunteers is not only due to altruism and a prosocial attitude, but is also influenced by a group of factors derived from the interior of the organization, its management, and culture. This is indicated by the Person–Environment model, which includes compliance of work, mission and

strategy, as well as compliance with a group of colleagues and superiors.

# Noble Cause Corruption and Task-Related Rule-Breaking Behavior

R. C. van Halderen[1] and E. W. Kolthoff[2]

[1]Avans Centre for Public Safety and Criminal Justice, Avans University, 's-Hertogenbosch, The Netherlands

[2]Department of Criminology, Open University, Heerlen, The Netherlands

## Synonyms

Dirty hands; Integrity violation; Noble cause corruption; State crime; Task-related rule-breaking behavior; White-collar crime

## Definition

Noble cause corruption: "breaking fundamental laws, not for personal gain, but for a purpose that appeals to our basic moral sensibilities" (Delattre 2011, p. 211).

Task-related rule-breaking behavior: "police officers breaking laws or formal internal rules in support of performing their lawful task" (Van Halderen and Kolthoff nd).

## Introduction

Noble cause corruption is a concept well known in police studies. It refers to rule violations by police officers for "just" causes. Although the concept received scholarly attention for over several decades, the core features of noble cause corruption have remained fairly unclear. This vagueness appears to have hampered theoretical development and empirical assessment of the phenomenon. Task-related rule-breaking behavior is a more refined alternative term which has been recently introduced to stimulate future (empirical) research. Both concepts and their differences are briefly described in this entry. It is shown how in other governmental organizations

N

and institutes the violation of rules for legitimate causes is also present. Overlap exists with different concepts which are studied in various scientific domains (e.g., white-collar crime, unethical behavior, and dirty hands). The last parts of this entry give insight into the potential causes of the behavior and the way it may develop on both an individual and organizational level over time.

This entry is partly based on a related article which the authors wrote (Van Halderen and Kolthoff nd).

## Noble Cause Corruption, Coping with a Harsh Ethical Dilemma

Noble cause corruption is the result of a renowned ethical dilemma in policing: acting in accordance with the rules and letting a criminal walk or breaking the rules in order to get a thief, murderer, or rapist behind bars. The concept resembles the proverb "the end justifies the means." Common examples can be found in detective novels or Hollywood movies. For instance, a "hero" detective who uses illegal search methods falsifies evidence and violently" "punishes" perpetrators who escape conviction. Noble causes are legitimate goals benefitting society. Corruption refers to the evasion or violation of procedural constraints: organizational policy or law of due process (Caldero and Crank 2011; Crank et al. 2007). If there exists no other means than a dirty means, and the goal is unquestionably good, following or breaking the rules both have dire consequences. Hence, choosing between these two wrongs renders finding an innocent and fair solution impossible (Klockars 1980).

Although currently there exists only limited knowledge about the forms and frequency in which noble cause corruption is committed, it has been shown that it is not a fictional phenomenon. One of the most famous and serious cases was disclosed by the Wood Royal Commission in Australia (Wood 1997). The commission investigated the obscure activities of the New South Wales (NSW) Police Service during the mid-1990s and revealed the existence of severe "entrenched" and "systemic" corruption. In a wide variety of corruption cases examined by the commission, noble cause corruption raised its head. The commission, explicitly preferring the term process corruption, listed the following violations (p. 68):

- Lying under oath (perjury)
- Planting evidence
- Forcing confessions in the form of unsigned records of interview and falsified notebook records
- Denying basic rights in respect of matters such as the use of a caution or incarceration for the purpose of interview
- Assaults and pressure to persuade someone to confess
- Manipulating evidence to present a better case
- Posing as a solicitor to advise a suspect to cooperate
- Manipulating the product of electronic interception to delete anything that might prove to be embarrassing
- Unofficial and unauthorized practices such as putting suspected street drug dealers on a train and "banning" them from an area
- "Taxing" criminals who are perceived as standing above the law

The Wood Royal Commission (1996) interpreted the violations as striking at the heart of the criminal justice system. Not only discrediting the police organization but other related institutions, such as the courts, as well. If police officers systematically act if they are above the law, it is to be expected that the public loses its trust in the criminal justice system. Innocent people may be convicted, and criminals could be released because of breached procedural law. Noble cause corruption may severely damage the relationship between citizens and the state, seriously hampering the country's government.

Although the concept of noble cause corruption received scholarly attention since the 1980s, with Delattre (2011) explicitly coining the term in 1989, research on the phenomenon appears to be still in its infancy. As is also stated by Cooper (2012), most research on noble cause corruption is anecdotal (Caldero and Crank 2011; Klockars

1980), philosophical (Delattre 2011; Kleinig 2002), or policy orientated (Harrison 1999; Miller 1999; Newburn 2015; Punch 2000, 2009; Sunahara 2004). Empirical research has only been done in a limited fashion, with most assessments not having noble cause corruption as its main focus (Crank et al. 2007; Porter and Warrender 2009; Van Halderen and Lasthuizen 2013) or being of an exploratory nature and narrow scope (Goldschmidt and Anonymous 2008; Merrington et al. 2014).

To this day, and in all likelihood one of the main causes of the phenomenon being underexamined, there has been no discussion in the literature about the core features of noble cause corruption. The concept is shrouded in a certain amount of vagueness. A clear and common definition is absent. Noble cause corruption is often described using varying and "loose" terms that do not conflict but emphasize different aspects of the behavior. For instance, noble cause corruption has been described as a form of punishment for perceived criminals (Skogan and Meares 2004) to secure convictions or executed for organization gain (Porter and Warrender 2009). Besides the diverse descriptions, the exact rules that need to be violated for an offence to be labeled noble cause corruption are unclear, and the terms "noble" and "corruption" have somewhat contradicting and confusing properties.

## Task-Related Rule-Breaking Behavior, an Alternative Concept

Recently task-related rule-breaking behavior has been proposed as a more refined alternative term (Van Halderen and Kolthoff nd). It has been introduced to encourage more structured and interdisciplinary research on the phenomenon. Task-related rule-breaking behavior is defined as: police officers breaking laws or formal internal rules in support of performing their lawful task. The concept differs from noble cause corruption on the following elements:

1. Norms violated. Noble cause corruption is about the violation of procedural law. Also, as mentioned previously, department policy that implies some procedural constrain are viewed as part of the rules that relate to noble cause corruption (Caldero and Crank 2011; Crank et al. 2007). However, exact department rules or policies have not been specified. Thus, some lack of clarity remains regarding the boundaries of the concept. To minimize any confusion, task-related rule-breaking behavior concerns the violations of formal internal rules and national and international legislation (e.g., the Universal Declaration of Human Rights). The formal internal rules are bound to three criteria: they are generally applied within the police organization (individual agreements are excluded), they have been communicated by a formal authority figure within the organization, and their violation is subject to disciplinary sanction (e.g., formal reprimand or dismissal from the police service).
2. Covering the entire police mission. Noble cause corruption seems to be confined to law enforcement (i.e., crime fighting). In general, however, the police in Western countries have a mandate which goes beyond law enforcement and includes order maintenance and providing service or assistance to the public (e.g., crowd control, emergency first aid, and recovering missing goods) (Broadhurst and Davies 2008; Dempsey and Forst 2009). Task-related rule-breaking behavior is about the entire police task and includes violations such as abusing interfering bystanders in an accident area or reckless driving while rushing to an emergency situation.
3. The intention to do "good," a personal utilitarian perspective on what is "just" for the greatest number of people (Harrison 1999), is no longer seen as the primary explanation for the behavior. Other variables may also play a crucial role in the onset and development of the behavior, ranging from unfamiliarity with the law to severe peer pressure. Thus, task-related rule-breaking behavior is less narrowly focused than noble cause corruption and allows for the examination of alternative influential factors and mechanisms. This also

warrants the use of the label task-related rule-breaking behavior, in which the noble cause is no longer mentioned.

## Similar Phenomenon in Other Public Organizations

The concepts of task-related rule-breaking behavior and noble cause corruptions are defined in such a way that they are only applicable to police work. Nevertheless, the core of both concepts – violations in the benefit of society and/or the organization – is not specific to policing but is behavior which also occurs in other public organizations and institutes. In the literature, these behaviors in other parts of government have received various labels (see: Van Halderen and Kolthoff nd).

In the discipline of public administration the phenomenon is often understood as a specific type of integrity violation, which in itself may also be labeled as a form of unethical behavior or public misconduct (Lasthuizen et al. 2011; Van der Wal et al. 2006). Based on a categorization of integrity violations within the police organization by Huberts (1998), a broad typology was developed for use in (local) government organizations (Lasthuizen et al. 2011). Two types of violations were categorized which may be committed to further one's task. The first is termed improper use of authority and is described as the use of unlawful and/or improper means to reach organizational objectives. The second type is labeled misuse and manipulation of information and concerns the intentional or unintentional abuse of information. It is conceivable that society or the organization could benefit from violations in this category, at least in the short term. For example, public officials may break inter-agency information sharing protocols in order to find a quick solution to a pressing social problem or conceal negative information to secure the department's image.

In the discipline of criminology the concept of white-collar crime overlaps greatly with the phenomenon described, especially its subtype state crime (Payne 2013). State crime consists of unlawful acts committed on behalf of the state or specific governmental agencies. Offences for personal gain are excluded (Kauzlarich et al. 2001, 2003). Important in this context is the concept of trust. State crime, and white-collar crime in general, can be seen as a violation of trust (Friedrichs 2010; Kauzlarich et al. 2003). At worst, state crime completely erodes the public expectation that government officials or agencies will decently fulfill legitimate objectives. State crime has many forms, the most serious being war crimes such as the Nazi holocaust, the recruitment of child soldiers by government forces in Eritrea, and the systematic torture and abuse of Iraqi prisoners in Abu Ghraib (Rothe 2009). Closer to the theme discussed, however, are less atrocious offences committed by governmental agencies. For instance, the FBI unlawfully disrupted the activities of political groups and the CIA assisted in the blackmail of foreign leaders (Friedrichs 2010). State crime can be committed in all sorts of government organizations and by all sorts of public officials.

The last noteworthy concept is that of dirty hands. The concept has been studied and debated for over several decades in philosophy and political science. The current debate around the concept was started by Walzer (1973) in his article "Political Action: The Problem of Dirty Hands." The term dirty hands is derived from a play of the same name by Jean-Paul Satre ("Les mains sales"). The concept explains an ethical dilemma in political decision-making. The ethical dilemma itself has been the topic of discussion far longer, even going back to ancient Greece (De Wijze 2005). Dirty hands refers to situations of conflicting values, a means-ends dilemma very similar to noble cause corruption. Stocker (1990, p. 9) described the behavior as "acts that are justified, even obligatory, but none the less wrong and shameful." These acts may simultaneously be praised and punished (De Wijze 2013). Politics is an area particularly vulnerable for dirty hands behavior. Political decisions can greatly affect the wellbeing (social, economic, physical, etc.) of the population governed, for a short or a long time. The burden resting on politicians in crisis or war situations seems especially

heavy. Such events can be highly unpredictable and finding a solution is often acute. The vulnerability of politics is also due to the relative ease in which extremely bad things can be committed. Politicians command state resources and take decisions about life or death (e.g., starting a war) (Archard 2012). The concept of dirty hands received a central position in the scholarly debate on the moral aspects of torture (Van Erp 2013; Yemini 2014).

## Explaining Task-Related Rule-Breaking Behavior

Since the concept of task-related rule-breaking behavior has not yet been the subject of empirical investigation, the literature on closely related concepts (noble cause corruption, integrity violations, state crime, etc.) is currently the most helpful in gaining a deeper understanding of the factors that potentially influence the behavior. What is clear from the research on related concepts is that the behavior is generally caused by a cluster of factors. Specifying the influential factors involved is complex, and gaining a good insight in their interplay seems even harder.

One way to understand the manner in which multiple factors lead to task-related rule-breaking behavior are *INUS* conditions introduced by Mackie (1965, 2002) (see: Huberts and De Graaf 2014). Mackie argued that a combination of "*I*nsufficient" but "*N*ecessary" factors produces a certain effect. Each factor on its own does not generate the result but is an indispensable part of the causal process. The combination itself is "*U*nnecessary," but "*S*ufficient." Meaning that another cluster of influential factors may lead to the same result. For example, in an attempt to solve a murder case a police detective unlawfully breaks into a home to search for incriminating evidence. The detective is highly motivated to find the killer, is skeptical about procedural law, is experienced in lock picking, and the control by his superiors is limited. None of these factors is sufficient for the break in to happen, but their combination explains the detective's unlawful behavior. In another situation, a different set of "Insufficient" but "Necessary" factors may lead to this type of violation.

Different influential factors, and different combinations of these factors, are ostensibly related to different types of task-related rule-breaking behavior. Breaking into the home of a suspected killer will be connected to other motives and factors than abusing an annoying bystander at a traffic accident. In general the influential factors are located at three different levels: the individual police officer (micro level), the police organization (meso level), and the society (macro level) (Huberts and De Graaf 2014). Examples of individual factors are personality structure (Lee and Ashton 2014), individual value orientation (Caldero and Crank 2011; Rokeach 1973), emotions (Martinko et al. 2002; Neuman and Baron 1998), and the amount of professional experience (Delattre 2011; Klockars 1980; Paoline and Terrill 2007). The organization can stimulate task-related rule-breaking behavior by, for instance, imposing overambitious performance targets (Sharpe 1995), exercising limited control (Punch 2009), or facilitating organizational subcultures in which "loyalty" is more highly valued than "integrity" (Westmarland 2005). Societal factors which could contribute to task-related rule-breaking behavior are diverse as well, ranging from unrealistic public expectations concerning the reduction of crime (Terpstra and Van der Vijver 2005), and legal standards that do not fit real-life policing (Punch 1985), to judges condoning "creative" police investigation practices (Punch 2009), and new crime forms for which conventional police methods do not seem to be well suited (Huberts and Naeyé 2005).

## The Dynamic Nature of Task-Related Rule-Breaking Behavior

Task-related rule-breaking behavior appears to be dynamic in nature. The behavior can evolve on both an individual and an organizational level. The violations of individual police officers may change in frequency and severity over time, and the behavior could spread throughout the organization or slowly disappear. In the literature on

police corruption the development of the behavior on an individual level is often metaphorically described as the "slippery slope." This metaphor is used to illustrate how corrupt behavior may start off quite innocent (e.g., a police officer accepting a free meal) and develops to serious forms of unlawful behavior (Kleinig 1996; Sherman 1982). Corruption on an organizational level is often understood as a collective undertaking which could become, at worst, completely embedded in the structure and culture of an organization (see: Ashforth and Anand 2003; Brief et al. 2001; Palmer 2008, 2012). Ashforth et al. (2008, p. 671) view corruption, also metaphorically, as an infectious process:

> Corruption is both a state and a process. The concept of corruption reflects not just the corrupt behavior of any single individual – defined as the illicit use of one's position or power for perceived personal or collective gain – but also the dangerous, virus like "infection" of a group, organization, or industry. If corrupt individual acts are left unchecked, they can spread to other individuals and magnify in scope and audacity, in ways that can eventually transcend individuals and groups and become embedded in the very culture of an organization and industry.

The development of rule violations within an organization and on an individual level both consist of different phases (Palmer 2008, 2012; Sherman 1982). Although the relationship between the individual and organizational level has not received much scholarly attention, two processes seem to play a crucial role in the development of the behavior on both levels.

The first is the "rationalization" of misbehavior. Rationalizations are psychological strategies that are used to neutralize negative feelings concerning past or future wrongdoing (e.g., guilt, shame, and regret). Rationalizing a wrongful act hides the erosion of one's moral identity by reducing the dissonance between a self-image of being virtuous and behaving immorally. It is a defense mechanism against self-blame and allows everyday people to commit offences without perceiving themselves as deviant, corrupt, or criminal (Anand et al. 2004; Ashforth and Anand 2003; Umphress and Bingham 2011; Weaver 2006). Examples of rationalizations which may be used by police officers to neutralize the stress associated with task-related rule-breaking behavior are denying the existence of a victim ("He deserved to be punished."), the denial of injury ("I did not really harm anyone."), and appealing to higher-order values ("Because of my assertive actions new crimes were prevented.") (see: Anand et al. 2004). The use of euphemistic language is often part of rationalizing wrongdoing. Unethical acts can (partly) lose their vileness by describing them using "innocent" words and phrases. Even the most severe inhumanities can be "sanitized" by using euphemistic language (Bandura 1999). In the Nazi Holocaust, for instance, the killing of Jews was reframed as "special treatment," "evacuation," and the well-known "final solution" (Adams and Balfour 2004, p. 18).

Socialization into the behavior is the second crucial process in the evolution of rule violations. The socialization process, in which newcomers are familiarized with the values, norms, and beliefs of their new primary group, is aimed at testing and altering the newcomer's attitude towards the violations committed by the group. Rationalizations, euphemistic language, and gradual habituation play an important role in this process. The newcomer's identity as an ethical person is supported by the group, with him or her learning to interpret the violations as admissible or even desirable. Peer pressure may be significant with encouragement to act in a certain way and punishment when feelings of doubt are displayed (Anand et al. 2004; Ashforth and Anand 2003). The police organization seems susceptible to these kinds of socializations processes. Some units or groups may have developed subcultures in which violations such as task-related rule-breaking behavior are routine or normal (see: Punch 1985, 2009). Socializing newcomers into the behavior is crucial for the continued existence of such a subculture (Ashforth and Anand 2003). Remarkable is also how the training program for police recruits may facilitate socialization into rule-breaking. With "war stories" told by academy instructors and field trainings officers showing how real policing differs from the books (Caldero and Crank 2011; Sherman 1982).

## Conclusion

Police officers violating rules for legitimate causes is still an underexamined phenomenon. The phenomenon is complex and has many facets that require additional scholarly attention. Currently many (basic) questions remain unanswered, for instance: In which forms does the behavior manifest itself? How frequent do officers commit these types of violations? Are there patterns and trends in its frequency? Which factors influence the behavior? And how do these factors relate to each other and relate to different forms of the behavior? Does an individual slippery slope exists? Can the behavior be of a collective nature, and how does it develop within the organization? The recent introduction of the concept of task-related rule-breaking Behavior can be viewed as a first step towards studying the phenomenon in a more structured and interdisciplinary fashion. It explicitly allows for the incorporation of research findings on closely related concepts, such as state crime or integrity violations. Research done on these concepts is currently one of the most valuable information sources for gaining a deeper understanding of task-related rule-breaking behavior (Van Halderen and Kolthoff nd).

In a practical sense task-related rule-breaking behavior provides a challenge for the police organization. How should the organization cope with police officers committing these types of violations? As is often the case, "an ounce of prevention is worth a pound of cure." Increasing the familiarity of police officers with the phenomenon and its potential causes appears to be one way to reduce the amount of task-related rule-breaking behavior within a police team or unit. Hence, research on task-related rule-breaking behavior also has important practical implications, and considering the many related concepts even appears useful for other governmental organizations.

# Nongovernmental Organizations and International Nongovernmental Organizations

J. Steven Ott and Jesus N. Valero
Department of Political Science/Public Administration, The University of Utah, Salt Lake City, UT, USA

## Synonyms

Economic and social council

As defined originally by United Nations ECOSOC resolution 288[X], Article 71, 1950, (Some authors assert that the term *nongovernmental organization* was first coined in 1945 when the United Nations was created. See, for example, Davies (2014)) a **nongovernmental organization (NGO)** is: "Any international organization which is not established by intergovernmental agreement shall be considered as a nongovernmental organization " (United Nations ECOSOC resolution 288[X], Article 71, 1950). A second commonly used definition is: "A group brought together by common aims and with a basic organizational structure; it does not rely upon governments for its formation or for most of the resources of its continued existence, and it is not profit-making in its aim" (Archer 1998: 1504). Neither of these definitions, however, is satisfactory for most any purpose because NGOs, in their large variety, do not always fit nicely within the confines of a single definition. Yet, it is impossible to study or inventory NGOs without clear agreement about what they are. In order to approach a comprehensive understanding of what NGOs are, we first explore two other interrelated and overlapping concepts: *civil society and nonprofit organization*. We then turn to an elaboration of the distinctive features of nongovernmental organizations (NGOs) and international nongovernmental organizations (INGOs).

## Civil Society

There are widely ranging views about what *civil society* (Orchard 2016: 225–235) and *civil society organizations* are and are not. For example, *civil society* has been construed as a society similar to what Alexis de Tocqueville described in 1840 – a world consisting of voluntary organizations and associations through which individuals become part of something larger than themselves, contribute to the public good, and learn how to be good citizens (de Tocqueville 1840). In this sense, civil society is "the realm of organized social life that is voluntary, self-generating, (largely) self-supporting, autonomous from the state, and bound by a legal order or set of shared rules" (Diamond 1994: 5). Yet, many nonprofit

N

organizations that are often labeled "civil society organizations" are businesslike, professionally staffed and run, service providers with no members or volunteers, and are predominantly dependent on revenue from government contracts and grants.

To begin this exploration of *civil society*, we rely on the Johns Hopkins Global Society Index (Salamon and Wojciech Sokolowski 2004a; Salamon et al. 2004). This index is useful for understanding civil society across contexts because although there are common elements, civil societies look different from country to country (See, for example, a discussion of the linkage between the concepts of civil society, nonprofit organization, and private government in Mendel (2010)). The conceptual and operational considerations that went into the construction of the "Global Civil Society Index" are valuable underpinnings for an understanding of NGOs. At a conceptual level:

> There seems to be a reasonable consensus about its [civil society's] central core. That core consists of the basic private associational life of a society – the private associations and organizations that operate more or less outside the confines of the state and business as well as of the family, though they may receive aid and support from all of these. Such "intermediary" institutions function as the social glue of society. They bring people together for joint activity without the need for official auspices. They thus provide vehicles for the individual initiative for the common good, or at least for the common good as perceived by some reasonable segment of the community. (op cit. Lester M. Salamon and S. Wojciech Sokolowski, 3)

The conceptual, structural, and operational features of *civil society organizations* that Johns Hopkins arrived at for the inclusion of organizations in its index are:

> The set of (1) formal or informal organizations or structured relationships among people that are (2) private (i.e., not part of the apparatus of the state), (3) not profit-distributing, (4) self-governing, and (5) voluntarily constituted and supported.

Construction of a "Global Civil Society Index," however, requires advancing ideas from concepts (i.e., features) to reality by identifying specific criteria by which to judge civil society organizations. The Johns Hopkins major criteria for organizations to be considered *civil society organizations* are:

- The presence of informal as well as formal organizations
- The mobilization of significant voluntary effort in addition to paid employment
- A diverse fiscal base that includes fees, charges, and public sector support in addition to philanthropy and private giving
- The importance of contextual factors, such as an enabling legal environment and a climate of popular support, in shaping the sector's development
- The variety of functions these organizations perform, including both "expressive" functions and "service" functions
- The diverse forms that civil society takes in different countries and regions (op cit. Lester M. Salamon and S. Wojciech Sokolowski, 66, 67)

These criteria make it apparent why many totalitarian states place restrictions on the formation and operations of civil society organizations when they can easily become breeding grounds, support systems, and collective voices for people who hold views that are contrary to the state and its policies. For example, the massive migration from rural western provinces to the industrialized eastern provinces in China overwhelmed the government's ability to provide services. Therefore, despite pervasive governmental distrust of civil society organizations, the government reportedly permitted civil society organizations in the Pearl River Delta area to provide service functions – but *never* expressive functions or mobilization of significant voluntary efforts that might lead to civil unrest (Ma (2006); Benjamin Read and Robert Pekkanen explain why civil society organizations have varying types and degrees of freedom in different East and Southeast Asia countries, in (2009) and Ma (2002: 305–328).

## Nonprofit Organization

As with the concepts of *civil society* and *civil society organization*, there is a vast array of definitions of *nonprofit organization*. Most definitions

take a negative approach by describing what a nonprofit organization is not and what it is not allowed to do. For example, nonprofit organizations in the United States do not have owners, they may not distribute profits (or surpluses), and most types of nonprofit organizations may not engage in political campaigns. On the other hand, definitions that focus on the positive aspects of what nonprofit organizations do and how they make the world a better place inherently tend to be lengthier and more complex but are much more useful for describing the spirit and essence of nonprofit organizations (Ott and Dicke 2016; see also Lohmann 1989: 367–383). This type of definitions tends to emphasize the aspirations, goals, and activities that nonprofit organizations encourage and enable people from all walks of life to seek and engage in. In essence and in concept, *a nonprofit sector is a civil society*, and a *nonprofit organization is a civil society organization*.

As with *civil society* as explained in the previous section, advancing from concept to useful definitions requires criteria to assess which organizations are *nonprofit organizations*. Two widely respected scholars of the nonprofit sector have proposed somewhat overlapping but quite different criteria: Peter Frumkin and Kirsten A. Grønbjerg. Frumkin identifies:

> three fundamental features of the disparate entities that constitute the nonprofit and voluntary sector . . . that connect these widely divergent entities: (1) they do not coerce participation, (2) they operate without distributing profits to stakeholders, and (3) they exist without simple and clear lines of ownership and accountability. (Frumkin 2002: 3)

Grønbjerg's five major factors that make the nonprofit sector distinctive include:

> First, the sector operates under private, not public auspices.
>
> . . ..
>
> Second, the sector operates under a particular ownership structure in which there are no formal ownership rights, with corresponding implications for the exercise of property rights and lack of access to equity finance.
>
> . . ..
>
> Third, the sector is rooted in voluntarism.
>
> . . ..
>
> Fourth, the sector's purpose involves substantive rationality – the achievement of particular missions and substantive goals – not just profit for the sake of profit or reelection to political office . . .
>
> . . ..
>
> Finally, the nonprofit sector operates with a particular type of technology. By and large, it does not produce things or process cases or transactions but seeks to change people – their views, values, behaviors, and/or knowledge. (Grønbjerg 2016: xiv, xv)

Comparing Frumkin's fundamental features with Grønbjerg's major factors in table form:

| Frumkin's three fundamental features of organizations in the nonprofit sector | Grønbjerg's five major factors that make the nonprofit sector distinctive |
|---|---|
| Non-coercive participation | Rooted in voluntarism |
| They do not distribute profits to stakeholders | No formal ownership rights with implications for lack of access to equity finance |
| Do not have simple and clear lines of ownership and accountability | No formal ownership rights |
| | Operate under private, not public auspices |
| | Purpose involves substantive rationality, not just profit for the sake of profit |
| | Seek to change people, their views, values, behaviors, and/or knowledge |

Frumkin's and Grønbjerg's criteria overlap on the issues of ownership, distribution of profits, and lines of accountability – by inference. Frumkin readily acknowledges that his first fundamental feature, *non-coercive participation*, does not eliminate many organizations from inclusion. To indicate how blurred the boundaries around the nonprofit sector can be, consider the common practice in the United States of requiring persons convicted of minor crimes to do community service. If convicts are required to "volunteer" with a nonprofit food bank as part of their sentences, does this coerced participation place the food bank outside the nonprofit sector? Obviously, for most of us, it would not.

Grønbjerg's third major factor, "rooted in voluntarism," is more expansive than Frumkin's first fundamental feature but still is blurred. If the

services of a nonprofit are exclusively delivered by professionally trained and paid staff, is the organization outside the scope of the nonprofit sector? Probably not. The point is clear, however: all criteria or boundaries that attempt to separate organizations in the nonprofit sector from organizations in the other sectors – government agencies and for-profit businesses – cannot be absolute. They must be somewhat conditional.

Grønbjerg's fourth and fifth criteria shift from "negatives" to "positives" as she attempts to capture the essence or spirit of nonprofit organizations. Nonprofit organizations value money, just as businesses and government agencies do. The differences are important. Private businesses do things, create things, and sell things in order to provide financial gains to their owners. In contrast, nonprofit organizations need money in order to be able to do things that help them achieve their mission – to "change people, their views, values, behaviors and knowledge" (ibid., xv). Money is the reason for a business to exist. Money is a necessary resource for a nonprofit organization to make some aspects of the world a better place.

Finally, Grønbjerg's first major factor is "operates under private, not public auspices." Legally, nonprofit organizations in the United States are a special type of private corporation. They are incorporated under the laws of a state, and as such, they operate under the laws and jurisdiction of a state. In addition, many types of nonprofits benefit from tax-exempt status at both the state and federal level. Reporting requirements to the state and federal government, however, are usually limited to annual financial reports (Nonprofit organizations that successfully apply for tax exemption and/or tax deductibility with the US government and/or the state of incorporation are subject to more extensive reporting requirements, but still do not operate under the auspices of a government. See, for example, the Commerce Clearing House's annual *United States Master Tax Guide*, Hopkins 2016, 2017). Despite their legal relationships with state and federal governments, nonprofits do not operate under public auspices. This distinction is important but tricky in the United States and more so in totalitarian states. For example, if a nonprofit in the United States receives a large majority of its revenue from government through contracts and grants, does the nonprofit operate independent of public (government) auspices? Dependence on a single or very limited number of revenue sources usually requires a nonprofit organization to adopt policies, procedures, and accounting/financial practices similar to those of the funder, and as a result, the nonprofit may "look" a lot like a government agency.

Having explored the related concepts of civil society and nonprofit organization, we now turn our attention to nongovernmental organization.

## Nongovernmental Organization (NGO)

> The difference between nonprofit organizations (NPOs) and NGOs is slim. However, the term "NGO" is not typically applied to U.S.-based nonprofit organizations. Generally, the NGO label is given to organizations operating on an international level although some countries classify their own civil society groups as NGOs.
> *NGO* activities include, but are not limited to, environmental, social, advocacy and human rights work. They can work to promote social or political change on a broad scale or very locally. NGOs play a critical part in developing society, improving communities, and promoting citizen participation. (Grantspace, a service of the Foundation Center, New York, NY. http://grantspace.org/tools/knowledge-base/Resources-for-Non-U.S.-Grantseekers/ngo-definition-and-role. Retrieved 01/02/2016)

In other words, NGOs are essentially the same entities as nonprofit organizations and civil society organizations– but they operate outside of the United States. For some reason, the United States prefers the term "nonprofit," whereas the rest of the world prefers "nongovernmental." Another difference is that NGOs operate under the laws of the country in which they were incorporated or in which they operate. To the degree that there is agreement about the definition of *civil society organizations* and *nonprofit organizations*, there is also agreement about the definition of *nongovernmental organizations*.

As the quotation from the Foundation Center's GrantSpace (above) indicates, there are two major

types of NGOs, those that operate within a country (other than the United States) and those that operate internationally. Usually, *NGO* refers to a domestic NGO – an NGO that operates within a country. When an NGO operates internationally, it is usually referred to as an *INGO*, or *international nongovernmental organization*, but not always. Often, INGOs provide financial support, technical assistance, and other related resources to NGOs for the purpose of advancing society, strengthening communities, and enabling citizen participation within a country.

Because Salamon and Sokolowski's Johns Hopkins Index that was introduced earlier is intended to serve as a *Global Index*, whereas the Grønbjerg and Frumkin criteria are for US nonprofits, we now compare the Johns Hopkins criteria with those of Grønbjerg and Frumkin.

| Salamon and Sokolowski's major factors for inclusion in the Johns Hopkins Index of Global Civil Society | Grønbjerg's five major factors that make the nonprofit sector distinctive | Frumkin's three fundamental features of organizations in the nonprofit sector |
|---|---|---|
| The presence of informal as well as formal organizations | | |
| Significant voluntary effort in addition to paid employment | Rooted in voluntarism | Non-coercive participation |
| Multiple sources of income, including earned, public support, and donated | | |
| Private, not part of the apparatus of the state | Operate under private, not public auspices | |
| Contextual factors, e.g., legal environment and popular support | | |
| Voluntarily constituted and supported | | |
| They perform expressive functions and service functions | Purpose involves substantive rationality, not just profit for the sake of profit | |
| | Seek to change people, their views, values, behaviors, and/or knowledge | |
| They vary in different countries and regions | | |
| Not profit distributing | No formal ownership rights with implications for the lack of access to equity finance | They do not distribute profits to stakeholders |
| | No formal ownership rights | Do not have simple and clear lines of ownership and accountability |
| Self-governing | | |

When combined, the three sets of criteria represent a rather comprehensive, probably not very controversial, and practical definition of an NGO. Neither Grønbjerg nor Frumkin is likely to object to the inclusion of several of the Johns Hopkins criteria: informal and formal organizations, contextual factors, variance among countries and regions, and self-governing.

- Informal as well as formal organizations: Many NGOs and nonprofit organizations do not file for incorporation with their state governments – they simply exist with no legal status. This criterion was likely so obvious as to be overlooked.
- Contextual factors and variance among countries and regions: Laws and cultural factors strongly influence the structure, purposes, and functions of NGOs and nonprofit

N

organizations, and laws and cultural factors vary among states and nations.
- Self-governing: This criterion represents a significant problem in some parts of the world but not in the United States (for Grønbjerg and Frumkin). It is common for authoritarian governments to govern and/or tightly control NGOs.

Likewise, Salamon and Sokolowski are not likely to object to including the Grønbjerg and Frumkin criteria of no formal ownership rights and no distribution of profits, although there may be nations where NGO laws do not require these features.

In many countries, it is not possible to know how many NGOs exist or what types of functions they perform (Comparisons among estimates about the size and magnitude of the nonprofit sector in some countries should be made only with considerable caution. There is not widespread agreement on terms or what should be included. See Salamon and Wojciech Sokolowski 2004b). Estimates about their magnitude usually are extrapolated from reports of government agencies and international organizations such as the United Nations, the World Bank, and the Organization of Economic Cooperation and Development (OECD).

The size, resources, aspirations, and influence of NGOs in countries around most of the globe have expanded so rapidly and comprehensively since the 1970s that some observers refer to this growth as "an associational revolution" (Edwards 2009; Salamon and Wojciech Sokolowski 2004b). NGOs have become important social, economic, and in some instances political actors in some less developed nations as well as in more developed nations (For examples, see Chen 2013; Hearn 2007: 1095–1110; Gugerty 2010: 1087–1112; Mirabella et al. 2007: 110S–135S). "NGOs today are vitally important in providing additional checks on the legislative and executive branches of government. . .. [and] come to enjoy an impressive amount of influence over government policymaking and to play an important role in building civil society" (Eizenstat 2004: 15). Lester Salamon and his colleagues also note that a:

> "global associational revolution" is underway around the world, a massive upsurge of organized private, voluntary activity in virtually every corner of the globe. . .. Known variously as the "nonprofit," the "civil society," . . . the "NGO," or the "charitable sector," this set of institutions includes within it a sometimes bewildering array of entities. (Salamon et al. 2004: 3)

The structure, governance, financing, permitted activities, and public acceptance of domestic NGOs vary greatly among countries. The roles they play in any given nation depend mostly on the government's views about its own purposes and its institutions. For example, to the degree that a government views its role as a servant of the people, voluntary organizations (NGOs) are likely to be vibrant actors. In contrast, a government that seeks to control its population through the use of power usually will not permit robust NGOs.

Particularly in totalitarian or authoritarian societies, governments may attempt to control not only political and economic activities but also in the social, religious, and family spheres. These forms of government often oppose the existence of independent nongovernmental organizations (Ma 2002: 306). A government may overtly suppress the formation or operations of NGOs, or it may decide to provide services directly that in other countries may be contracted out to NGOs – thereby depriving NGOs of revenue sources needed to survive. "In the extreme, the state can proscribe NPOs, nationalize them, or prohibit consumers from using their services. . .. Thus, while the nonprofit sector flourishes at the will of the government, its existence also limits the power of the state in democratic societies (Smith 1998: 218).

Even a country such as China that has historically tightly controlled NGOs out of concern for social unrest vacillates as political circumstances and concerns change. China

> has been downsizing, transferring many economic and social responsibilities to a variety of social groups. . .. The first and essential step in this strategy was for the government to legalize and to promote nongovernmental organizations. Once they became legal and gained government support, dormant SOs [social organizations, shehui tuanti] were revitalized and new ones launched. (Stoddard 2012, see also Anheier 2014)

## International Nongovernmental Organization (INGO)

During the nineteenth and early twentieth century, a government's primary responsibility was to protect citizens against external threats and internal disorder.

> Other aspects of public life could be left to the family or to organized groups not directly under governmental control.... As governments increased their involvement in building the foundations of an international society with rules and norms for activities such as trade and commerce, travel and transport, health services and even warfare, so the potential arose for international nongovernmental organizations (INGOs). These bodies represented nongovernmental organizations working across frontiers to particular ends. (op. cit. Dichter 1999: 40)

The primary functions of most INGOs are to transfer resources from more developed countries to less developed countries for humanitarian assistance, development assistance, and/or recovery and rehabilitation purposes or to advocate. A few well-known examples of assistance-type INGOs include Save the Children International, Oxfam International, Medicines San Frontières, and CARE International. Examples of INGOs that are predominantly dedicated to advocacy include Amnesty International, Greenpeace, and World Wildlife Federation. Some INGOs engage in both assistance and advocacy.

The number and activities of INGOs burst onto the global scene in the 1970s and 1980s largely because the governments of the United States and a few other developed countries decided to use INGOs as their intermediaries in delivering foreign aid, development assistance, and humanitarian relief particularly in less developed nations. For instance, INGOs permitted the US government to have "clean hands" as they attempted to keep newly emerging nations from opting for alliance with the then-Soviet Union. The use of private institutions to alleviate poverty and stimulate popular participation in the civic life of these societies became a major objective of US foreign policy (Anheier 2014).

In addition to governments' foreign aid policies, other factors that have influenced INGOs in their assistance efforts include the post 9/11 security environment; pressure from funders to increase staff professionalism and accountability; increasing political influence and advocacy by INGOs; the effects and aftereffects of the great recession of 2008' ongoing conflicts in Afghanistan and other countries in the Middle East; state failures in, for example, Cambodia and Africa; and many weakened legal, financial, and cultural barriers to INGOS.

> INGOs themselves, have accounted for between $60 billion and $65 billion in aid to developing countries annually for about the past decade.... An OECD [Organization for Economic Cooperation and Development] estimate for 1994 is that $5.7 billion in aid to developing countries passes through NGOs. (op cit. Stoddard 2012)

Helmut Anheier has identified a cluster of factors and trends that together help to explain the explosive growth and influence of INGOs up into the second decade of the twenty-first century although at a lower rate in the most recent years. They include (op cit. Anheier 2014: 471, 472):

- INGOs are rapidly gaining favor with individual, foundation, and corporate donors around the globe.
- High-profile humanitarian disasters, such as the devastating 2009 earthquake in Haiti and floods in Pakistan in 2010 with heavy publicity due to the development of international media, including the Internet, which provided nearly instantaneous information about international disasters and emergencies worldwide.
- The end of the Cold War and many regional conflicts that had been fueled by the Cold War opened doors for INGOs into countries that had been closed.
- New opportunities for INGOS in the global governance system including INGOs gaining access to United Nations-organized conferences and summits and the growing influence of "parallel summits" for civil society organizations since the 1992 Earth Summit in Rio de Janeiro.
- The ability of international support networks to apply pressure on antagonistic repressive governments and help local NGOs fight for national and local causes and policies.

- The development of legal systems and regulatory structures and processes within countries that permit, support, and legitimize INGOs and indigenous NGOs.
- Technological progress, especially in information and communication by email and Internet, has dramatically facilitated cooperation across borders. For example, "dot causes . . . such as . . . social networks that mobilize support for particular policy campaigns primarily . . . through a website."
- The emergence of a "world culture" or "world society" as a powerful force behind internationalization of the nonprofit sector.

Abby Stoddard reports that the number of US-based NGOs engaged in international relief and development grew from 52 in 1970 to over 400 in 1994. There were 584 US-based NGO funding partners with the US Agency for International Development (USAID) at the end of 2008 (op cit. Stoddard 2012).

Although *globalization* is obviously interwoven among Anheier's factors, we are more direct in addressing it as a factor. *Globalization* is the interconnectedness of the worldwide economy, the interweaving of international and domestic organizations, governance systems, and communication capabilities that ignore boundaries of time and space. Transnational connectedness is the reason why most INGOs exist.

# Nonlinear Policy Change

Denise D. P. Thompson
Department of Public Management, John Jay College of Criminal Justice, New York, NY, USA

## Synonyms

Chaos theory; Complex systems; Nonlinearity; Policy change; Systems thinking

## Introduction

The concept of linear relationship suggests that two quantities are proportional to each other: doubling one causes the other to double as well. In nonlinear relationships, a wider range of possible dependencies occur, leading to great uncertainty and unpredictability of outcomes. Our understanding of public policy domains, actor interactions and policy decisions making are guided by linear thinking to our detriment. As policies fail to solve intended problems, it is important to understand the limits of linear thinking and move beyond it. Understanding the policy environment, and policy decision making as complex, unstable and contingent result in more robust public policies.

John (2003) in assessing the state of the public policy discipline suggests that there are two things to bear in mind when considering how to theorize about public policy: one is the nature of theory in the social sciences; the other, the character of public policy. Derived from the Newtonian model of physics, the predominant current thinking about public policy is that we are able to exercise control over a policy system. In other words, like classical physics, we can use well-defined interventions to predict future states in public policy since public policies are made in well-defined policy systems. This implies conceptually that the system can be isolated from its surroundings, an intervention can be introduced to solve a specified problem, and that the system character would not change radically with time, once the intervention is made. These assumptions are fundamental in the Newtonian model where control can be exercised. Newton's laws show how it is possible, given an initial point in time and place, to plot out the trajectory of a system for all future times. In other words, given the full specification of a system, it is possible to determine its future behavior since policy analysts are able to separate the internal behavior of the system from external fluctuations.

## Complex Nature of the Policy Domain

Yet, in the real-world it is not easy to separate external fluctuations from internal system behavior. Policy domains are dynamic human systems displaying complex patterns of relationships and activities as actors organize to solve policy problems. A policy domain encompasses all the components of the political system organized around a substantive policy issue. Policy domains are dynamical systems in that the elements that constitute them interact and continually evolve over time; and, policy change is characterized by disturbance and increased variability in system behavior before the system reorganizes to solve a policy problem. The policy domain includes:

- Laws including regulations and executive orders mandating provision of services
- Multiple actors including governments, private and civil society leaders, and international organizations

- Institutional relationships and power dynamics among the actors
- Public and private resources
- Institutions expected to implement the policy, at the national, state, and local levels
- Monitoring and accountability systems

Like policy domains, policy problems are dynamic. They respond to changes in the political, legal, social, cultural, demographic, economic, and ecological arenas, as well as changes in technologies including costs, and to emerging public policy issues. As a result, the multiple systems and interactions in any given policy domain can be enormous. The policy domain for natural and man-made crises epitomizes the messiness and dynamism of policy systems. As evidence suggests, crises are trending toward an increasingly trans-boundary experience – those that originate in one country and affect other countries such as air pollution; those that originate in many countries simultaneously and lead to global impacts, such as carbon dioxide emissions for climate change; and ubiquitous risks, i.e., those that occur in each country in similar forms and may necessitate a coordinated international response, such as airline safety, trans-border anthropogenic crises, or climate change.

Policy problems are more frequently crossing geographical borders, threatening multiple cities, regions, and countries, and are making the steering of response operations and recovery efforts problematic. Complex crises such as these involve multiple systems and subsystems, multiple levels of actors, information, and strategies. They generally last much longer, impact multiple sectors and functions, and pose greater challenges to the authority of public and private organizations than do smaller and more routine ones. In these situations, change is not gradual and incremental, but usually shows periods of turbulence and instability, displaying dramatic changes or growth spurts interspersed with periods of stability. Linear thinking warps the understanding of these types of policy challenges that evolve in an unpredictable or uncontrolled manner, where the emerging conditions can be entirely different than its starting state.

Policy scholars have realized for a long time that policy problems are becoming increasingly messy. They involve multiple levels of actors, many of whom are fundamentally political, they involve multiple systems and subsystems, they contain multiple unknowns, they display an absence of a clear chain of causation; disparate information sources and big data epitomize their evolution. These data cannot be easily collected nor can they be easily or quickly processed and assessed. In addition, because policy decisions are often politicized evidence is not the major driver in policy decisions. These factors impact policy formulation, policy decisions and policy outcomes. It cannot be assumed that policy problems are well understood, or that policy interventions are well-defined and therefore will produce well-defined and predictable results. The outcomes of policy changes under these circumstances are uncertain and contingent in that, change relies on interaction with many moving parts, and factors that are unknown when policy decisions are being made. The results, then, are in part unknown. Understanding this calls for nonlinear, not linear thinking.

## Systems, Complex Systems, and Chaos in Policy Making

Systems thinking with more complex feedback loops, as well as complex systems and chaos theory can help to understand the nature of policy change in dynamical systems, where policy problems reside. Early applications of these nonlinear approaches in the natural science displayed chaotic swings in insect populations, evolution of the spread of diseases like Ebola, extreme sensitivity of weather patterns, and ecological system disruptions. And, in the social sciences, they relate to the evolution of mass movements, or non-linear behavior of stock markets, and more recently in policy studies concerning complex and messy policy problems. These theories and theoretical approaches provide some tools to tackle the varying and emergent problems in social life.

In systems thinking, the parts of the systems are so interdependent and interrelated, where the output of one cycle feeds into another, that a change in

one of the cycle's parts will lead to a change in another part, or other parts of the system, but not in a linear or proportional way. In addition, external factors impact the system, adding greater deviations in outcome and more uncertainty as a result. Hence, the end state of a system is unknown. Systems sometimes enter regions of highly erratic and chaotic behavior, increasing the difficulties of predicting their future behavior.

Borrowed from the natural sciences, chaos is a specific term that refers to wild variations over even very small changes in initial state in dynamic deterministic systems. In chaos theory, the wild variations result from feedback as two variables interact, potentially leading to exponential, nonlinear change – the variables behave in seemingly chaotic ways. Chaos theory provides a means of understanding and examining many of the uncertainties, nonlinearities and unpredictability of social system behavior. It implies "that instability and disorder are not only widespread in nature, but necessary to the evolution and complexity in the universe" (Kiel and Elliott 1996, p. 2). This thinking goes contrary to Newtonian reasoning, which states that if there is enough information about the current state of the universe in a deterministic system, and the observer is privy to all its fundamental and unchanging laws, it would be possible to calculate the entire history of the universe as well as predict its entire future. Chaos theory highlights the impossibility of long-term predictions in complex policy domains such as climate change, criminal justice, education, and a wealth of other social problems. The study of chaos has been an important precursor to the modern study of complex systems.

Complexity is a holistic approach to learning and understanding the world, which itself can be viewed as a complex, non-deterministic system with multiple sub-systems. In the social sciences, complexity theory identifies instability and disorder in fields including politics and policymaking, and links them to the behavior of a system that is complex and non-deterministic. A non-deterministic system is one that is so complex that its future state cannot be predicted to any great degree of certainty, because there are significant levels of uncertainty and ambiguity. Complex systems consist of multiple interacting sub-units that tend to exhibit new collective behaviors called "emergent properties" as the sub-systems interact. These emergent properties can only be discerned from a system perspective. Furthermore, responses of these interacting sub-systems to external stimuli can become very complicated. The changes brought about by these interactions tend to persist in the new post-disturbance state even when the original force is restored.

Complexity theory provides several possible policy-making insights (Cairney 2012, p. 2):

- Law-like behavior is difficult to identify in the policy process. Because the policy process is "guided by a variety of forces," suggesting that one variable will only influence another under particular conditions that are difficult to specify does not make sense. A policy that was successful in one context may not have the same effect in another.
- Systems appear to have "self-organizing capacities," making them difficult to control; the effect of an internal or external force may be large or small but this is impossible to predict from the force alone. Hence, there are surprises in policy outcome from an intervention "proven" to have worked elsewhere.
- The landscape, which provides the context for the choices of agents, is unstable and often changes rapidly – policy agents must adapt quickly and not rely on a single policy strategy.
- Actors within complex systems can create their own perception of what they want and how to behave in the landscape they are in to ensure their preferred outcome – policymakers must, therefore, seek to understand their policymaking environment.

These insights provide guidance as we try to understand policy domains as nondeterministic, dynamical systems, that one size does not fit all, that relationships in policy systems influence policy outcomes, and that in all but the most basic of cases, policy change is nonlinear – i.e., the effect was not influenced by a proportional cause. Hence our enduring reliance on Newtonian models to

derive policy prescriptions will often lead to policy failure. The points raised above show the need for adaptive and contingent strategies in policy decision making that rest on nonlinear thinking and lead to nonlinear policy change. However, for public policy, these ways of viewing the world present limitations in their applications with real-world policy problems.

## Limitations of Using Nonlinear Thinking to Solve Real-World Policy Problems

Policies aim to solve society's problems and make predictions about general trends in social life; and using those trends, render possible solutions to fix the policy problem and usher in a predetermined future state. When policy makers do not recognize the complexity of their policy environments, they mess up. Evidence from policy evaluation shows that proposed interventions fail to produce relevant outcomes because much of the useful information remain unidentified. In addition, some of the interactions in the subsystem are not known, or may be difficult to observe; and the future conditions are difficult to predetermine because of internal integration of the policy subsystems and adaptation to the external macro-environment. These factors make our efforts to propose effective policy solutions highly contingent, often leaving governments and other policy actors impotent in finding viable solutions the more vexing real-world policy problems.

## Conclusion

There is a reason why, with all the super computers, decision modeling tools, and data processing capabilities, linear Newtonian thinking continues to guide policy decisions. The human challenge continues to be managing the complexity inherent in managing public problems. Putting boundaries around policy problems without paying attention to the internal and external interactions will no doubt continue to guide policy analysis, even while it is understood that interactions in policy subsystems lead to emergent states, and that the increasing messiness of policy problems adds complexity to the process. To better comport with the idea that policy change around an increasing number of policy problems are nonlinear means that we have to rethink our policy approaches and consider the application of new theories, theoretical approaches as well as policy making applications to formulate more effective solution to policy problems, while also understanding the limitation of these approaches in human systems.

Nonlinear policy change is possible if policy makers engage systems and complexity approaches, and are mindful of the caveats associated with these approaches in policy making. If policy analysts and decision makers in the field want to understand why policy initiatives often fail, or why public decisions, and their outcomes do not remain stable over time, or why solutions must vary by sector and by time and place generally, and why preferred policies differ in their consequences for the policy beneficiaries, they must not only be able to understand policy domain interactions, but they must also be guided by the hyper complexity of many policy problems and the domains in which they reside.

# Nonprofit Financial Leadership

Deborah A. Carroll
University of Central Florida, Orlando, FL, USA

## Synonyms

Nonprofit fiscal health; Nonprofit sustainability; Mission drift

## Definition

Engaging in best practices to ensure continuation of operations in pursuit of the nonprofit's mission, as well as proper planning for long-term financial sustainability.

## Introduction

There are several important steps that an effective leader can take to ensure that the nonprofit organization under his/her watch is financially well managed. First, effective financial leadership requires recognition of the unique fiscal environment of nonprofits, including, but not limited to, a well-developed understanding of rules, laws, and responsibilities related to the nonprofit and its board members. Effective financial leadership also requires development and tracking of an annual budget, which might also include a consideration of long-term needs and/or service expansion. Equally if not more important than a precise estimate of income and expenses comprising the annual budget is continual monitoring of spending throughout the fiscal year through the use of internal controls and cash management. Finally, the most effective financial leaders will ensure proper recording of financial events through the use of accrual accounting and other GAAP principles, as well as produce and analyze annual financial statements to determine the financial position of the nonprofit at year-end and also to identify any potentially problematic areas requiring greater attention, change, or possible elimination.

### Fiscal Environment

An effective leader must first understand that the fiscal environment of nonprofits is different from that of governments and businesses. Although the term "nonprofit" may suggest that an organization is either not interested in producing or even allowed to produce a profit, this is a misnomer. Indeed, nonprofits have various mechanisms through which to generate income and profits to cover their operating costs and delivery of services. Instead, the term nonprofit refers to what is commonly known as the "nondistribution constraint." Under this constraint, nonprofit fiscal officers are prohibited from taking net profits and distributing them to board members, staff, or directors and must put any surplus revenue back into the organization. Oftentimes, this results in an expansion of services, replacement of supplies and/or outdated equipment, or accumulation of reserve funds in case of emergency. Therefore, a nonprofit's fiscal environment is not one of increasing the wealth of those involved with the organization, but rather of providing some type of service(s) to a community and/or client in need. At its heart, this means that nonprofit financial leaders must focus on values-centered management, where the mission of the nonprofit and its accompanying values play a large role in how the organization is run, organized, and financially managed.

A benefit of nonprofits that private sector businesses do not share is tax exemptions on income that is earned in the process of the nonprofit carrying out its mission. Although activities related directly to the mission of the nonprofit are not subject to federal income tax, nonprofits need to be aware of the Unrelated Business Income Tax

(UBIT), where any income collected through activities outside of the organization's mission could be subject to taxation. At the broadest level, nonprofits are exempt from federal corporate income tax if they meet the requirements outlined in the Internal Revenue Code (IRC), which classifies nonprofits into a number of categories (IRS 2016). The most common classification of nonprofits is 501(c)(3), which includes public charities and private foundations. The Internal Revenue Service (IRS) requires that charitable organizations registered as 501(c)(3)s are restricted from certain types of political or lobbying activities and must file the IRS Form 990, 990-EZ, or 990-N (depending on their level of gross receipts) on an annual basis. Private foundations pay a small excise tax on their investment earnings and must file form 990-PF annually. Failure to file the appropriate financial summary report of the nonprofit's finances for three consecutive years may result in the nonprofit losing its tax-exempt status. Another common classification is 501(c)(4), which identifies an entity as either a social welfare organization or a local association of employees. Certain nonprofits, like churches, are not required to register with the IRS (though many do) and are exempt from filing the IRS 990 forms. Other types of religious organizations, however, must register and file the required forms. Any additional tax exemptions, such as the most common sales and/or property taxes, will be dependent upon the laws of the state in which the nonprofit incorporates. However, just because a nonprofit is exempt from paying sales tax, it does not necessarily mean the nonprofit is also not required to collect sales taxes on the final sale of good and/or services to non-exempt consumers and then remit such tax revenue to the relevant state or local government. Due to such complexity, nonprofit financial leaders must be acutely aware of relevant federal, state, and local tax laws to ensure compliance and maintain necessary responsibility of the nonprofit.

## Annual Budgeting

Perhaps one of the biggest challenges for nonprofit financial leadership is to manage the appropriate balance between the short-term pursuit of the organization's mission and its long-term need for financial sustainability. A nonprofit's budget represents its financial plan for the upcoming fiscal year. One of the first steps of budgeting is to identify the costs associated with the nonprofit's core activities. Included in this calculation of costs are direct program costs as well as administrative overhead/indirect costs. Inclusion of administrative overhead costs (such as costs associated with accounting, legal services, general board of director meetings, etc.) is crucial to depicting the full cost of a program, because otherwise the actual costs of the program will be underestimated, ultimately affecting the long-term sustainability of the program and the organization (Nonprofit Assistance Fund 2016).

It is also important to identify the various sources and amounts of revenue and support the organization expects to receive in relation to each program. Ideally, total income will meet or exceed total expenses. In general, nonprofits receive income from fundraising (gifts and donations), grants, membership dues, fee for service business models, in-kind donations, government grants and contracts, and volunteer efforts. This variability in funding streams has important implications for nonprofits. First, some income sources have stipulations for how the funds can be spent. For example, individual donors or grant-making foundations can give money to be used for anything, including general operating or "overhead" expenses (known as unrestricted funds), or they can impose restrictions on what specific activities that money can or cannot fund. This leads to differences in restricted, both permanent and temporary, and unrestricted net assets (i.e., the difference between a nonprofit's internal assets or ownership value and its liabilities or what it owes externally). Nonprofit financial leaders must therefore remain cognizant of not only the amounts but also the types of money available for spending in the short-term or for long-term savings. Another issue that can arise with varying funding streams is mission drift, where the pursuit of particular sources of income could heavily influence, and potentially change, the mission of the organization. Some nonprofits may have the ability to invest as a means to generate

revenue and should therefore be concerned with values-centered investing (to avoid mission drift) and the prudent investor rule, which are legal standards that managers must follow when investing on behalf of their organizations. Another important distinguishing feature for some nonprofits is endowments. Endowments provide a perpetually protected principal amount whereby the interest earnings from its investment may be used for short-term spending. Investment, when possible, often allows a nonprofit to develop and maintain an operating reserve to have in case of hard economic times. Overall, when it comes to income sources, nonprofit financial leaders must once again strike the appropriate balance between resource dependency and goal displacement or mission drift.

Nonprofit financial sustainability can be seen through two lenses: financial (profitability) and programmatic (impact). Unsurprisingly, financial planning is very important to the long-term sustainability of a nonprofit so as to avoid what has been termed the "nonprofit starvation cycle." This refers to a situation when a nonprofit has underestimated the full costs required to operate and therefore does not have surplus income to invest in the proper infrastructure. Many nonprofits falsely assume that keeping overhead costs low is a sign of efficiency. However, proper investment into making sure the organization can continue to operate to further its mission is of the utmost importance. Due to the variability in income of nonprofits, it is especially important for financial leaders to make sure they have enough of a surplus to maintain operations in the case of an unexpected decrease in income. It is generally considered a best practice to have sufficient reserve to cover 3 months of operating expenses. Therefore, sustainability is undoubtedly a function of effective financial leadership throughout the budget process and fiscal year.

## Monitor Spending

Nonprofits are governed by a board of directors, often consisting of volunteers, who maintain fiduciary responsibility. A nonprofit board has three main legal duties, known as the duty of care, duty of loyalty, and duty of obedience. The duty of care refers to the board remaining diligent in their oversight of the organization's activities, as well as ensuring prudent spending of income and uses of other assets. The duty of loyalty refers to the board's responsibility to put the interests of the organization ahead of their personal interests and to expend resources on activities and actions that express the nonprofit's mission and also perhaps to help grow the organization. Finally, the duty of obedience means it is the board's responsibility to keep their organization in compliance with laws and policies and to make sure it stays true to its mission. The board is held responsible if there are infractions against state or federal laws or policies. As this relates to financial leadership, it is crucial that the board be kept apprised of all organizational financial matters to allow them to make as fully informed decisions as possible. In addition, a chief responsibility of the board is to assign management of financial resources, including the monitoring of spending using internal controls, to either a chief operating officer, chief financial officer, ex officio treasurer, or executive director. As a general best practice, the individual who maintains day-to-day responsibility of a nonprofit's finances should not sit on the board. And, this individual must understand the fiscal responsibilities of the organization and carry them out in a consistent and timely matter, particularly when it comes to deadlines imposed by taxing authorities like the federal, state, and/or local government.

## Analyzing Financial Statements

When it comes to accounting for financial events and preparing financial statements for analysis, good financial leadership will most certainly use Generally Accepted Accounting Principles (GAAP) with oversight from the Financial Advisory Standards Board (FASB). Following this best practice requires nonprofit financial leaders to prepare at year-end a set of financial statements, including the Statement of Financial Position, Statement of Activities, and the Statement of Cash Flows. Voluntary Health and Welfare Organizations (VHWO) are required to prepare a Statement of Functional Expenses in addition to the other statements. These financial statements

allow for both internal and external stakeholders to assess the financial position of the organization at year-end, as well as evaluate the nonprofit's use of resources throughout the fiscal year to determine programmatic impacts. In the United States, nonprofit organizations are actually required to provide their financial statements to the public upon request. In addition, there are a growing number of websites dedicated to using the information derived from nonprofits' financial statements to develop individualized ratings for such charities. The primary purpose of these independent ratings is to help consumers make informed decisions about the charities to which they donate money and/or volunteer time. Internally, presenting an accurate, clear, and thorough financial picture of the organization as it stands and as it will likely continue into the future allows board members to identify programs that require more investment versus those that are low profit/low impact and perhaps need to be eliminated. These decisions require creative and strategic decision-making from the financial leaders and key board members within the organization, especially because these are often emotionally laden decisions.

## Conclusion

Ultimately, adhering to the activities described above, nonprofit financial leaders will be able to better plan for the long-term financial sustainability of the organization. Knowing and understanding the full costs of operating a nonprofit allows leaders in the organization to create an accurate budget. By creating a budget where operating revenue does not exceed operating expenses (or even allows for a small surplus) is a good way to guard against poor economic times and/or the nonprofit starvation cycle. Also, through concise monitoring of spending throughout the fiscal year and evaluation of financial statements at year-end, nonprofit financial leaders will be able to answer the most important question: Does the nonprofit have the resources it needs to be able to respond to threats and seize opportunities as they arise without compromising the volume or quality of its current services? Sustainability is closely tied to capacity and must strike a balance between the short-term operating needs of the nonprofit and the long-term goals of maintenance or expansion. Oftentimes, many nonprofit leaders are more concerned with the short-term over the long-term; however, this limited viewpoint potentially jeopardizes the sustainability of the organization.

## Synonyms

Domestic terrorism in USA; Gun violence; Mass shootings; Terroristic attacks in USA

## Definitions

Mass Shooting – The Investigative Assistance for Violent Crimes Act of 2012 definition for active shooter incidents and mass killings is defined by the law as three or more people in public places.

(Prior to 2012, mass shooting defined by the law as four or more people, in public places.)

## Introduction

Disasters often bring out the best in people. More than 40 years ago, Russell Dynes described communities and citizen behavior before and after a disaster (1970). An emergency provides the opportunity and motivation for a wide audience to respond. The requirements are usually fairly clear cut. In recent natural disasters such as tornadoes, hurricanes, tsunamis, or fires, citizens and organizations immediately begin to organize. Rescue teams are mobilized, food, blankets, and toiletries are collected, shelters are created, and money is donated by millions of Americans across the country. There is an increase in volunteerism as a response to natural disasters such as Hurricane Katrina, which struck the Gulf Coast and destroyed the city of New Orleans, Louisiana; Superstorm Sandy that struck the northeastern coast of the United States; and the Great Flood of 1993 that affected a large part of the Midwest along the Mississippi and Missouri rivers. Natural disasters often move individuals to volunteer during a crisis in order to restore a damaged area or assist victims during an emergency. As the crisis begins to subside, so too do the motivations for volunteering.

On April 6, 1995, a new type of disaster occurred. This was not a natural disaster; to some it was worse, because it was a planned attack against the government of the United States by one of its own citizens. This purposeful act killed 168 Oklahoma City citizens, including 19 young children and infants in the daycare on the second floor of the Alfred P. Murrah Federal Building. Oklahoma citizens, who lived in what is known as "Tornado Alley," would have been prepared if there was a house destroyed or a family in need of shelter or food or clothing, but the nature of this violent act left its citizens stunned and wanting to help, but unsure of how to do so. This entry focuses on the special role of nonprofit leaders to help their communities in the wake of a different type of disaster – an act of public violence – perpetuated upon a community by one or more individuals, intent on causing harm, even deaths among a community of citizens.

The typical role of a nonprofit leader can encompass a wide variety of duties and obligations. Often nonprofit leaders focus on the organization in which they serve, ensuring the viability and sustainability of the organization through a combination of inspiration and management. Some are active in their community and are tasked with leading initiatives on behalf of its citizens, while others work as collaborative partners to tackle gaps in services and resources for their town or city. Still others remain laser-focused on their specific organization to ensure it has both the financial and human resources to provide specific services. From ambassador to advocate to manager, the nonprofit leader is often viewed as trustworthy and compassionate toward the community. The very nature of their appointment by a board of directors establishes the special skill set required to lead an organization and often a community. However, when an act of public violence takes place in the community, the nonprofit leaders may be the individuals best situated to lead during the aftermath.

The Oklahoma City bombing remains the largest act of domestic terrorism in the United States. At 9:02 a.m., a large explosion occurred outside the Alfred P Murrah Federal building, destroying the nine-story building, killing 168 people, and injuring 850 more. Within a few minutes of the blast, news crews were capturing the event on television. Cable news carried continuous coverage of the event for several days without any commercial breaks. Millions of people around the world watched the rescue and recovery and followed the investigation as it unfolded. Following the horrendous attack, more than 9,700 people volunteered to help at the American Red Cross

## Extrinsic Motivations for Volunteerism

Although much research has been conducted on intrinsic motivations for individuals to volunteer

during natural disasters, social psychology research suggests certain extrinsic motivations for individuals to volunteer can also occur. Five such events related to acts of public violence in a community (common external threat; just world theory; terror management theory; celebrity role models; and proximity of event) are presented below.

When individuals perceive a common external threat, they seek a sense of community by finding common ground and downplaying divisions among groups within the community. The effects of this external threat on people's sense of community define how they perceive who belongs as a member of their in-group (Feshbach and Singer 1957). Volunteerism is often associated with a sense of community (Omoto and Snyder 2002), and people who identify with their community are more likely to work toward the common good (Van Vugt 2001).

A second theory revolves around just world theory in which people view the world as fair and just (Lerner 1997). Those who do good are rewarded and consequently those who do bad are punished. In a just world, people seek to restore justice when their idea of goodness is violated. The deaths of over 3,000 innocent victims on September 11 were almost certainly viewed by most Americans as an instance of an unjust world, and volunteering to help others is an act of setting things right and reestablishing a just world.

Terror management theory also predicts an increase in volunteerism and civic engagement motivated by extrinsic circumstances; however, it differs from just world theory. A common psychological reaction to tragic events is a sense of fear and uncertainty about the future. Individuals respond to these feelings of vulnerability by performing actions which can restore confidence and reduce anxiety. This sense of vulnerability and fear of death causes people to engage in actions intended to reduce their anxiety about their own mortality (Greenberg et al. 1997). Research shows that the act of helping reduces negative effects among those who are providing the help (Schroeder et al. 1995). Volunteerism increases the individual's self-esteem and demonstrates one's value to society.

A fourth theory to explain volunteerism as a response to extrinsic events is the impact on individuals of role models in the media, albeit a short-term effect (Brown and Potosky 1990). The attacks on 9/11 were without precedent in recent American history. Unlike the typical celebrity response to natural disasters in which well-known figures plead for assistance to help with recovery within the first few days following the disaster, the terrorist attacks remained in the social media for months and years following September 11, 2001. The highest levels of government put out a call for volunteerism as did a multitude of celebrity figures and politicians.

A fifth theory suggests that the closer individuals are geographically or emotionally to the event, the greater the influence on their social actions (Latane et al. 1995). More than 385,000 people in Oklahoma City knew someone who had been killed or injured in the bombing; 219 children lost at least one parent; 30 children were orphaned; 462 people were left homeless; and 7,000 people no longer had a workplace. After the bombing, over 12,000 volunteers and rescue workers participated in the rescue, recovery and support operations.

## Mass Shootings, Domestic, and Foreign Terrorism

Most acts of public violence are not executed by bombs or airplanes, as in the September 11, 2001, terroristic attack. Mass shootings are by far the largest number of public acts of violence. Following the July 2012 movie theater massacre in Aurora, Colorado, *Mother Jones* created an open-source database documenting mass shooting in the United States from 1982 to the present. The research focused on indiscriminate rampages in public places resulting in four or more victims killed by the attacker. Shootings stemming from more conventionally motivated crimes such as armed robbery or gang violence were excluded as were shootings in which the shooter(s) was not identified. Fifty-six cases were documented over 30 years from 1982 to 2012;

however, from January 2013 to December 2019, 61 mass shootings took place. The FBI has reported that mass shootings have tripled in frequency just in the last few years. Altogether mass shootings in public places have claimed 2,396 victims (948 fatalities and 1,443 wounded), while the Oklahoma City bombing, the World Trade Center bombing, February 26, 1992, the four coordinated September 11th attacks, and the Boston Marathon bombing claimed 11,177 victims (3,175 fatalities and 8,002 wounded). A partial list of the communities that become household names following public acts of violence include:

- El Paso, Texas Walmart 22 fatalities, 26 wounded, August 3, 2019
- Thousand Oaks, California Nightclub Shooting, 12 fatalities, 22 wounded, November 17, 2018
- Santa Fe Texas High School, 10 fatalities, 13 wounded, May 18, 2018
- Marjory Stoneman Douglas H.S., Parkland Florida, 17 fatalities, 17 wounded, February 2018
- Texas First Baptist Church, Sutherland Springs, Texas, 26 fatalities, 20 wounded, November 15, 2017
- Las Vegas Strip, Nevada, 58 fatalities, 546 wounded, October 1, 2017
- Pulse Nightclub, Orlando, Florida, 49 fatalities, 53 wounded, June 12, 2016
- San Bernardino, California shooting, 14 fatalities, 21 wounded, December 2, 2015
- Charleston Church Shooting, Charleston, South Carolina, 5 fatalities 2 wounded, June 17, 2015
- Sandy Hook Elementary, Newtown Connecticut, 27 fatalities, 2 wounded, December 14, 2012
- Movie Theater, Aurora, Colorado, 12 fatalities, 70 wounded, July 20, 2012
- Virginia Tech, Blacksburg, Virginia, 32 fatalities, 23 wounded, April 16, 2007
- Columbine, Colorado H.S., 13 fatalities, 24 wounded, April 20, 1999
- Luby's Massacre, Killeen, Texas, 24 fatalities, 20 wounded, Oct. 16, 1991

A mass shooting in Tucson occurred January 8, 2011, during a "Congress on Your Corner" meeting held in a Safeway parking lot. The event was an opportunity for citizens to meet Congresswoman Gabrielle Giffords. A 22-year-old man, Jared Loughner, first shot Congresswoman Giffords directly in the head at close range, then continued to fire on people in the crowd. Before some of the bystanders were able to tackle him, he injured 13 and killed six people, including a nine-year-old girl. Congresswoman Giffords was taken to the hospital with a critical brain injury. Giffords survived the shooting but retired from Congress to focus on difficult rehabilitation due to the significant injury.

Both the Oklahoma City bombing and the Tucson mass shooting received national attention for years following the events; however, the citizens killed in those attacks had connections to smaller communities. The nonprofit leaders of both communities and other communities across the United States played active roles to build social capital and collaboration following these tragic events in their community, following five principles outlined below.

## Assessing Community Propensity Violence

Former President Bill Clinton called the Oklahoma City bombing the "…last in a series of very high-profile violent encounters' during the 1990s between anti-government activists and authorities" (Helton 2010). Clinton went on to warn that incendiary political rhetoric can influence people like Timothy McVeigh and Terry Nichols, who he described as "profoundly alienated, disconnected people who bought into this militant anti-government line" (Helton 2010).

In his article on the history of the US militia movement, Mark Pitcavage (2001) writes that the right-wing antigovernment movement adopted paramilitary culture and rose to prominence in the two years before the bombing. The ideology of the militia movement prompted some of its followers to stockpile illegal weapons and explosives, plot to destroy buildings, assassinate

governmental officials, and commit other criminal acts. According to research by the Pew Research Center, public trust in the government hit an all-time low in 1994 (Pew Research Center for the People and the Press 2010). Fortified by talk radio and a well-developed system among militia members of reprinting and faxing leaflets that described a US government that had grown too powerful and threatened the rights of its citizens, patriot extremist groups played a pivotal role in fanning anti-government sentiment among citizens (Pitcavage 2001; Carmichael 2010).

Although McVeigh was not a militia member, after the Oklahoma City bombing the media spotlight began to expose the more extreme militia movement, causing some of the militias to disband but also publicizing their existence to many other Americans who supported the movement. Ironically, the numbers joining militias grew after the bombing, but authorities were also on heightened alert. Within seven months of the bombing, Oklahoma Constitutional Militia leader Willie Ray Lampley was arrested and convicted for building explosives to bomb several targets. Lampley's conviction and many others across the nation terribly weakened the movement. Moderate members left due to the highly publicized arrests and extreme members became angry that militias were not doing more (Pitcavage 2001). In 2001, the country had a new foreign-based enemy to combat. Following 9/11, public trust in the government rose from 31% to 60%. However, it was short-lived.

In November of 2010, Gabby Giffords won her third term as a United States Representative, serving the eighth congressional district of Arizona. The race with her opponent Jesse Kelly had been a close contest described as nasty and vitriolic by citizens. Preceding the mass shooting in Tucson, Congresswoman Giffords had begun receiving death threats. Her office windows were smashed following her support of health care reform and a protestor was removed from one of Giffords' events when a pistol fell out of his jacket.

Following the mass shooting in January of 2011, Pima County Sheriff Clarence Dubnik discussed mentally unstable people. "…how they respond to the vitriol that comes out of certain people's mouths about tearing down the government, the anger, the hatred, the bigotry that goes on in this country is getting to be outrageous" (Dade 2011). On March 25, 2010, Giffords was interviewed on national television about the recent vandalism of her office. During the interview, Giffords stressed how important it was for all leaders to reduce the angry political rhetoric (The Daily Rundown 2010). As an example of polarizing rhetoric, Giffords pointed to former vice-presidential candidate Sarah Palin's Take Back 20 Campaign in which 20 elected officials were graphically placed beneath the crosshairs of a gun sight on a target map. Following the shooting, Palin's representative, Rebecca Mansour, tweeted a response to the scrutiny of the map as a possible incentive for someone to assassinate Giffords. Mansour said the crosshairs were not that of a gun, but rather surveyor symbols. Palin's website removed the map after the shooting (Terkel 2011).

In an opinion piece, Gary Bauer, former Under Secretary of Education and Chief Domestic Policy Advisor in the Reagan administration for eight years, cautioned the media to report that although the shooting happened during a time period of strong political rhetoric, the rhetoric was not the cause of the Tucson mass shooting (Bauer 2011). Pitcavage, Director of Investigations for the Anti-Defamation League, does not posit that angry rhetoric equates to violence but says that nonetheless strong rhetoric should be taken seriously, as it can mean those who express it might commit violence or convince someone else to commit violence (Niiler 2013).

According to the Pew Research Center's survey in March of 2010, only 22% of American citizens trusted the government. The center says it discovered a "perfect storm of conditions associated with distrust of government – a dismal economy, an unhappy public, bitter partisan-based backlash, and epic discontent with Congress and elected officials" (Pew Research Center for the People and the Press 2010). The two time periods preceding the Oklahoma City bombing in 1995 and the Tucson mass shooting in 2011 signified two of the lowest levels of trust by American citizens in their government since surveys on trust began in 1958, 22% and 19%, respectively.

In 2020, trust in the government has hit an all-time low; only 17% of Americans trust that government in Washington will do what is right. This is a complete turnaround from the 73% who expressed trust in government in 1958.

Staff at the National Institute of Civil Discourse in Arizona highlighted the mood in Tucson leading up to the 2010 election, "The political campaign (between Giffords and Kelly for the 8th congressional district seat of Arizona) was the worst I'd ever seen. The entire country was polarized and in Arizona the political ads were vicious, the campaign rhetoric was shameful." They commented on the use of words and phrase like "target" and "take-out," including Kelly's invitation to "Get on Target for Victory in November. Help remove Gabrielle Giffords from office. Shoot a fully automatic M16 with Jesse Kelly" (Gold 2011). Although the shooting happened in Tucson, "it was a wake-up call for the entire country" that leaders have a responsibility to demonstrate civil discourse to citizens so that problems can be solved.

"Our elected leaders used to meet far more often in committees where the real work is done. That has diminished and they are in Washington less frequently – so they aren't even developing working relationships with one another. This has contributed to the partisan politics and lack of interest in compromise and discussion."

In its measurement of trust in government, the Pew Research Center determined that Americans were not against the broader role of government, but rather the distrust was focused on the electoral system in the USA and the work of Congress. In addition, partisan politics has created a lack of confidence in the wisdom of fellow voters to make good decisions. Nearly half of the members in both the Democratic and Republican parties view the members of opposing parties as immoral. Since 2007, the majority of individuals who had confidence in their fellow citizens to make good political choices has decreased in confidence from 57% to 39%.

As the USA prepares for the 2020 election amid the greatest distrust in government recorded in the past 60 years and with growing hostility between the two parties, nonprofit leaders play a very important role in recognizing the simmering anger that can produce public acts of violence. The nonprofit leader, viewed as trustworthy and compassionate about their community, can access social capital to build bridges to decrease the likelihood of violence and instead urge people toward civil discourse. The positive news from the Pew Research Center is that in spite of the current negative view, 84% of Americans believe trust in government can be rebuilt, and 86% believe trust in their fellow citizens can be improved.

## Preparing for Overwhelming Shock and Overwhelming Generosity

When an act of public violence takes place in a community, there is an immediate shock that something that terrible could occur in one's own community. In Tucson, one nonprofit leader described the affront to one's sense of community in this way, "With the January 8 shootings, it was a judge, a congressperson, a child, a staffer, an elderly person, democrats, republicans. It was like every man. It happened in front of a Safeway, for heaven's sake! It struck at the core of everyone. There wasn't a way you could distance yourself." Even though other violent events had occurred before the bombing in Oklahoma and the mass shooting in Tucson, the idea of it happening in their town instead of something on the news was difficult to comprehend. The proximity of the event theory motivated Tucson residents to seek out ways to respond, either by setting up makeshift memorials, conducting vigils outside the hospital, or donating to favorite charities of their congresswoman, now fighting to survive.

Nonprofit leaders must first acknowledge their own shock and disbelief, but then quickly turn their attention to the needs of the community. When public violence occurs, citizens are motivated to do something positive in response and look to leaders in the community for direction. Motivated by the just world theory, citizens aim to right the wrong that has occurred. In addition to individuals volunteering to help, many cities begin to receive a large number of donations.

Oklahoma City received more than $35 million in charitable donations after the bombing in 1995. Boston received $80 million in donations after the Boston marathon bombing which killed five and wounded more than 280 on April 15, 2013. Over $30 million poured into Orlando, Florida, following the mass shooting at the Pulse Nightclub, June 12, 2016, where 49 people were killed and 59 others were wounded; and $34.2 million was donated after the Las Vegas massacre that killed 58 and wounded 546 people on October 1, 2017. In the case of Oklahoma City, the fund was overseen for nearly 20 years by the Oklahoma City Communities Foundation, a nonprofit organization that provided public records of how the money was distributed. In Tucson, more than $92,000 was donated to the Community Food Bank in honor of Congresswoman Giffords. An additional $53,000 was donated to the American Red Cross. By far, the greatest amount of donations followed the September 11, 2001, terroristic attack on the Twin Towers of the World Trade Center. More than $1.8 billion was donated to a variety of charities who pledged to help the victims of 9/11 or help the community move forward in a positive way. These charitable donations were separate from the $7 billion established by Congress to assist the victims and their families.

Nonprofit leaders must ensure the funds donated by a shocked public are distributed and used as intended in a transparent and equitable fashion. Tragically during events like this, false charities will spring up in order to take advantage of the community's desire to donate. Nonprofit leaders with sound financial experience can help direct the funds to organizations that will apply them legally in the manner they were intended.

Donations for victims are not the only funds directed toward communities following public acts of violence. Memorials, mostly paid for by donations, are designed and created to honor the victims of these acts. Some communities spend years planning the appropriate memorial. The 9/11 memorial and museum cost $700 million, funded in large part by charitable donations. The cost to operate the museum will be more than $60 million annually, paid for by future donations and ticket sales to tour the museum. The Oklahoma City National Memorial cost $29.1 million, $17 million of which were private donations. The Oklahoma City National Memorial Foundation, founded in response to the bombing, is responsible for raising additional funds to fully operate and upkeep the museum and memorial. Even the act of creating a memorial calls for nonprofit leaders to use their collaborative skills to bring many individuals and groups together to decide on the appropriate and best way to remember the victims. Newtown, Connecticut is still gathering input on the type of memorial to build from the families of the 20 children, ages 6 and 7, and seven adults who were killed in the Sandy Hook Elementary School shooting on December 14, 2012. They plan to begin building the memorial in December 2020 and complete it in 2021, at a cost of nearly $4 million, nine years following the tragic event. The commission working on the Sandy Hook Memorial were inspired by the thoughtful work done to create the Columbine Memorial in 2007, at a cost of $1.5 million, eight years following the April 20, 1999, mass shooting at Columbine High School that killed 13 and wounded 24. Although these collaborations take time and are performed by a diverse group of people with varying ideas, they are motivated to work together to emerge victorious against the common external threat that united them.

In addition to managing donations for victims, charities, and memorials, nonprofit leaders must be ready to respond to the number of volunteers who want to contribute their blood, sweat, and skills. In Oklahoma City, the city leaders called on the nonprofit sector to help manage the large scale of donations that included wheelbarrows, bottled water, knee pads, and food. Agencies, familiar with handling large inventory during natural disasters, were able to quickly mobilize sorting and distributing centers. Unlike natural disasters, however, the location of public violent acts are crime scenes and volunteers are kept away from the site and therefore must find other ways of helping. In most cases of public violence, there are no houses to repair, no debris to pick up, no rescues to be made. Volunteers are at a loss as to how they can help. Nonprofit leaders fulfill a

special role to not only help the victims, but to help the community heal from a terrible tragedy. In Tucson, one organization formed by a grieving mother who lost her 3-year-old son, Ben, to illness, had an established local charity where Ben's Bells could be built and hung as a way to help other grieving parents. Following the mass shooting in Tucson, community members began pouring into the small agency to create bells that were then hung around the city in response to the violence that had been visited upon their city. When Sandy Hook Elementary was reeling from the violence in their small community, a former Tucson resident who had relocated to Newtown contacted the founder of Ben's Bells in Tucson and asked they bring the same healing mechanism to Newtown for the residents there. Soon, Newtown residents were participating in the same therapy that Tucson residents had done just one year earlier, and bells were found hanging across the community.

Some acts of public violence leave behind a large number of wounded individuals. In the case of the Oklahoma City bombing, 680 people were injured. Following a request for blood donations, more than 9,000 units of blood were donated. After the Orlando shooting at the Pulse Nightclub, 28,000 pints of blood were donated. In the Las Vegas shooting where 546 people were injured, 68 of whom were in critical care, the request made for blood donations, brought a 53% increase in blood donations into the American Red Cross within the first three days. Although this indicates the desire of citizens to immediately respond to acts of public violence, it is also unlikely that it helps with the victims for whom it is intended. Most victims of mass shootings or bombings required blood transfusions within 24 h and blood donations take 48 h to process. In addition, if unused within a specified time frame, the donations have to be discarded. Nonprofit leaders could build awareness and plan accordingly for future events to protect their community members by organizing monthly blood drives so that any crisis can be met if or whenever it occurs. A case for organized blood donations was most clearly seen after 9/11 when more than 475,000 units of blood were donated, but only 275 units were needed to treat victims, and thousands of units had to be discarded.

## Incorporating the Community's Unique Strengths

Many communities have specific strengths that have been developed over time. Often nonprofit leaders have been major actors in developing unique attributes to aid in the health of the community. Following acts of public violence, these strengths can be utilized to address the crisis at hand. In Tucson, the Victim's Assistance Program, begun 35 years before the Tucson mass shooting, was one of the first programs of its kind in the country. The Victim's Assistance Program allowed volunteers with the program to go onto the scene to provide services to the victims of crime. At the time of the shooting, the program had over 20 advocates and more than 100 volunteers. As soon as the 911 phone calls were received, the Victim's Assistance Program volunteers were dispatched along with police and emergency personnel. The volunteers were allowed on the scene to speak with the victims and meet their needs. The volunteers had received extensive training to work with victims and coordinate their efforts with other emergency personnel. In addition, the volunteers provide one-on-one follow-up for each of the survivors, family members of victims, and witnesses to the shooting.

In Oklahoma City, known as part of "tornado alley," residents encounter natural disasters on a yearly basis. Several agencies were already skilled at various components of handling a large-scale disaster. The aftermath of the bombing required their ability to feed large numbers of people to care for the hundreds of rescue workers and investigators. They also had more than 300 buildings destroyed, and many people were homeless as a result. When donations began to pour in, they knew which agencies were the best to organize and distribute. Several nonprofit leaders believed they already had a lot of things in place and were prepared to help.

Following the Marjory Stoneman Douglas High School shooting in Parkland Florida,

February 2018, which killed 14 students and 3 school faculty and wounded 17 others, students Cameron Kasky, David Hogg, and Emma González and others from the school began immediately organizing the "Never Again" campaign. Kasky, the brainchild of Never Again, stated, "We are the three voices of this. We're strong, but together we're unstoppable. Because David has an amazing composure, he's incredibly politically intelligent; I have a little bit of composure; and Emma, beautifully, has no composure, because she's not trying to hide anything from anybody." González added, "All these kids are drama kids, and I'm a dramatic kid, so it really meshes well." The unique traits of the Parkland youth established a strong national movement that many nonprofit leaders meshed into current streams of support for like-minded causes.

At Virginia Tech, the psychology department had just completed a data collection project with 800 women who attended the university. After the April 16, 2007, mass shooting which killed 32 individuals and wounded 23 more, the department, reached out to these women and asked them to participate in further surveys about the shooting. Because of the prior data collection and the expertise of the researchers and psychologists, they were able to gather information about trauma and recovery directly from students on campus. Nonprofit leaders who are well versed in their community's particular assets play an important role in determining how the unique strengths of the community can counter violent acts.

## Navigating the Response

Although mass shootings have increased threefold recently, communities where acts of public violence take place are descended upon by news media. In the case of Oklahoma City, CNN had a 24-h news cycle and Oklahoma City was the biggest news of the day. Within a few minutes of the blast, news crews were capturing the event on television. Cable news carried continuous coverage of the event for several days without any commercial breaks. Likewise, the tragedy that unfolded on September 11, 2001, was broadcast across the world and images of the towers were captured and replayed in front of a shocked audience. The 93 h of coverage on every major US network was the longest uninterrupted news event in the history of US television.

President Bill Clinton in 1995 and President George W. Bush in 2001 made special trips to Oklahoma City and New York, respectively, after the tragic events and delivered messages to the American people. President Clinton differentiated the acts of the perpetrators from those of the residents and implored the community to counteract evil with good. Following 9/11, President George W. Bush offered American citizens a way to restore this sense of disconnection and reinvigorate civic engagement. After acts of public violence, elected officials are expected to visit and meet with victims and family members who have lost loved ones. Because acts of violence are increasing drastically, often the number of fatalities or the target of the shooter or bomber dictates if local, state, or federal officials will visit the community. The role of the nonprofit leaders may include helping to organize the visits as their agencies are most likely supporting the victims and to build on any words of encouragement or calls to action to help restore community healing.

The words of the elected official may preface the ways nonprofit organizations and citizens respond to the tragedies. After President Obama called on Americans to make "sure we align our values with our actions," following the Tucson mass shooting that left Congresswoman Gabrielle Giffords with a severe brain injury, several nonprofit leaders and citizens worked to establish the Institute of Civil Discourse at the University of Arizona to incorporate "Gabby's" desire for civil discourse to be restored.

Following acts of public violence, the answers to "Why?" often drive the work of nonprofit leaders in the community. Recently, the possible explanations of mental health, bullying behavior, and gun accessibility have all been seized as society ills that require correction. Nonprofit leaders can draw upon the momentum and passion of the residents to create programs to address these or

other concerns. Because of the large media attention, nonprofit leaders can harness the help of celebrity role models to help spread important messages or calls to action.

## Collaborating is Key

Nonprofit leaders have learned in recent years the importance of collaboration in accessing community and government grants. Funders prefer to invest when growing nonprofits are willing to work with other nonprofit organizations to meet the varied needs of the community. When an act of public violence strikes a community, the previous collaborative work of nonprofit leaders is vital to ensure that responses can be immediate and comprehensive. The collaborative work of Oklahoma City nonprofits in organizing logistics to help in tornado disaster zones was evident when the bombing occurred; however, there were no collaborative efforts with mental health professionals. In the wake of the bombing, it was evident that nonprofit leaders would have to develop more resources in mental health to meet the needs of the traumatized community. Four years later, when the great May 3, 1999, tornado ravaged the city, nonprofit leaders were completely prepared to address the multitude of needs. For small communities, small town relationships precede collaboration. Nonprofit leaders already know who to call upon and who to trust, including key officials in government. Some are even close friends and already work well together.

Nonprofit leaders have begun to form a network across the nation with other nonprofit leaders who have experienced an act of public violence. Just as Newtown reached out to Columbine for guidance on creating a memorial, New York reached out to Oklahoma City for guidance on how to provide large scale counseling to family members of victims who died in the attack. Several nonprofit leaders from stricken cities and towns have discussed the best ways to manage the large donations. Nonprofit leaders have little time to grieve or process the tragedy before they are called into service; therefore, many have found comfort in sharing their stories and experiences with colleagues in other cities who have faced or are facing the same challenges.

## Conclusion

In the wake of all of these tragedies, nonprofit leaders must discern if these events can be prevented in other communities. Terror management theory posits that citizens can reduce their own fear and sense of vulnerability by performing actions that promote confidence and establish their value to the community. Following Tucson's mass shooting, citizens and public officials debated the role of political leaders in inciting violence. The National Institute on Civil Discourse was created specifically to address that concern. Other nonprofit groups were either created or strengthened to address mental health, bullying, and kindness. In Oklahoma legislation was passed that dealt with acts of terrorism and victim's rights. A new network of agencies to treat mental health issues among survivors was created.

Following the December 14 shooting at Sandy Hook Elementary in Newtown, a wave of support for gun legislation began to build, with several Newtown parents, who had lost children, actively involved (Salcedo 2013). Gabby Giffords, who resigned her congressional seat in November 2011 to concentrate on her recovery, organized Americans for Responsible Solutions political action committee. According to the website, the mission is to "encourage elected officials to stand up for solutions to prevent gun violence and protect responsible gun ownership" (Americans for Responsible Solutions 2013). "Nonprofits not only discharge humanitarian action on behalf of the American public, but they generate public concern, shape the debate, shape the formulation of policies, and often influence who, by whom, and how they will be discharged" (Bryce 2005). Nonprofit leaders have always played an important role in community well-being. The pressure and camera lights following an act of public violence have proven many nonprofit leaders are well equipped to restore healing in their community.

## Synonyms

Effective nonprofit managers

## Introduction

The professionalization and credentialing of nonprofit managers has increased the effectiveness of top executives in the Third Sector. This is particularly true at larger organizations, where resources exist to support strong leadership development. Despite these advances, significant

challenges remain. There is a shortfall of trained professionals, and administrators report significant burnout resulting from pressure by both donors and boards.

Some fundamental differences prevail in the criteria for good leadership in the two segments of the nonprofit sector: Charitable institutions and member-serving organizations (churches, private schools, advocacy groups). Managers of charities must answer to benefactors, granting agencies, community leaders, and to external recipients. This makes stakeholder relationships more complex in this segment of the philanthropic sector.

Good management also requires adequate oversight mechanisms, particularly the presence of an independent voting board. Well-run charitable organizations utilize additional controls, such as an independent audit and publication of annual financial accounting (notably IRS Form 990). External oversight is provided by both the Internal Revenue Service, which can withdraw an organizationâ€™s 501(c)3 status, and by the Federal Trade Commission which can pursue criminal charges when fraudulent behavior occurs. Rating agencies evaluate the performance of charitable entities, enabling potential donors to avoid poorly run nonprofits. Despite these layers of accountability and oversight, it is not uncommon for charities to violate the trust place in them by donors, and this is one of the remaining challenges of nonprofit leadership.

## Effective Nonprofit Leaders

Effective nonprofit managers lead organizations that are impactful, focused primarily on mission rather than fundraising, and responsive to all of the various stakeholders that rightly have a say in how goals are established and pursued. The professionalism of management, with expectations that executives would possess educational and other credentials that are appropriate to the nonprofit sector, has improved the performance at larger nonprofits. An examination of what makes good leaders, and how the skill set can be developed that results in good leadership, can be found in Lombardo and Eichinger (2002). Conversely, many smaller nonprofits are unable to expend the resources necessary to hire credentialed managers. Oversight is a key factor in the rise of strong organizational leadership, and the elements of effective internal and external controls are discussed in detail below.

Analysis of effectual nonprofits tends to emphasize the *structure* of the nonprofit itself, rather than the characteristics of a successful manager. As noted in Bradshaw et al. (2007), depending on the focus of the nonprofit and its stakeholder involvement, an organization is likely to gravitate towards one of four governance models (e.g., Entrepreneurial or Constituency Model). The critical role played by a nonprofit's board in ensuring that an entity is both well-run and answerable to its constituencies is the central theme of much of the inquiry into effective leadership. Stid and Bradach (2009) distinguish between leadership and management, and note the importance of the former at impactful nonprofits. Brudney and Murray (1998) asserts that there is a positive correlation between the adoption of best practices and the perceived effectiveness of nonprofit boards, although the causation weakens when *objective* measures of performance are used. Although good board leadership appears to arise organically in many organizations, there is an accelerating movement towards training board members in best practices (e.g., see early work by Herman and Heimovics (1990), and subsequent work by Widmer and Houchin (2000)).

## The Best Charitable Nonprofits

Although identifying top nonprofits, those that are well managed, utilize contributions in an effective way, and are answerable to their stakeholders, involves at least a degree of subjectivity, the rubric used by ***Charity Navigator*** provides a consistent means of comparing the relative performance of nonprofits. Organizations are ranked according to both their financial performance (particularly what proportion of donations

**Nonprofit Leadership, Table 1** Top ranked charitable organizations, *Charity Navigator*, 2016

| Rank | Charity | Overall score[a] |
|---|---|---|
| 1 | Direct relief | 100.0 |
| 2 | Map international | 100.0 |
| 3 | The conservation fund | 98.2 |
| 4 | Rotary foundation | 97.9 |
| 5 | Americares | 97.6 |
| 6 | Doctors without borders | 97.2 |
| 7 | National council of YMCAs | 97.2 |
| 8 | Patient services, Inc. | 97.2 |
| 9 | Catholic medical mission board | 96.8 |
| 10 | Caring voice coalition, Inc. | 96.7 |

[a]Charity Navigator provides both a financial and an accountability and transparency ranking. The scores present here are the composite of those two scores

ultimately go to the nonprofit's expressed cause) and their transparency and accountability, with a composite score providing an overall assessment. Table 1 provides a list of the top ten charities in 2016 as identified by *Charity Navigator* (CN). Although about half of these not-for-profits are well-known organizations, several (e.g., Patient Services Inc.) would arguably be regarded as behind-the-scenes yet (clearly) well-run charities. Missing from CN's top ten list are many well recognizable names, indicating that visibility does not necessarily equal effectiveness. What is consistent across the organizations in Table 1 is a management and control structure that includes an independent voting board (uncompensated), an annual independent audit, and easy accessibility to a current Form 990 (the IRS filing required of nonprofits). Top nonprofits devote only a small proportion of annual expenditures to fundraising.

A similar accounting of the performance of member-serving not-for-profits (e.g., churches) is not feasible, as transparency and financial information is largely internal. A high degree of accountability may occur, however, as donor and beneficiary are one in the same. Certainly it is the case that as organizations such as these become more complex, the potential for misuse of financial resources increases.

## The Leadership Shortfall

It is widely recognized that ineffective leadership at nonprofits reduces the efficacy of the Third Sector. Poor management in the charitable sector in particular can be attributed to lack of oversight, inadequate training of key personnel, lack of accountability to stakeholders, and an inability to articulate focused organizational objectives. The results of this leadership deficit range from poor utilization of resources to a failure of control that results in misuse or theft of an organization's assets.

In *The Leadership Deficit* (Tierney 2006) it is noted that the growth of the nonprofit sector, coupled with the anticipated departure of many current top managers, will result in a need for hundreds of thousands of trained professionals – a need that is likely to go unmet. Male (2013) argues that poor performance is attributable to a lack of "leaders" at charitable organizations, despite the presence of many "managers." Exhaustive studies of top leadership (Bell et al. (2006)) found high turnover at nonprofits, with pressures from both donors and boards contributing to burnout. A remarkably high proportion (one in three) of top executives are forced out of their positions. In a similar analysis, focused on executives in the Pittsburgh region, Ban and Towers (2003) note that the credentials of nonprofit managers rise with the size of the organization; a not surprising finding, but one that has important ramifications for the effectiveness of the smaller nonprofits that dominate (at least in number) the sector. Contrary to the findings of Bell, Moyers, and Wolfred, Ban and Marcia found relatively high job satisfaction. Yet, Bonner and Obergas (undated) found that three out of four executives were actively considering leaving their current position. It has been suggested that charitable institutions transition towards a more corporate model of leadership, but this ignores the fundamental differences in stakeholder relationships that prevail in the Third Sector. As noted by Alexander and Weiner (1998), there frequently are insufficient resources in place to support the conversion to

a for-profit style of management, and further that such a transformation would seldom be desirable. Landles-Cobb et al. (2015) attribute the leadership deficit to poor "succession" planning, noting that the best talent may lie within a nonprofit organization, but simply needs to be nurtured. Finally, Osula and Ng (2014) note that executives in the Third Sector spend a majority of their time on concerns such as fundraising, preventing the kind of transformational change in leadership that would benefit an organization.

## Stakeholders and Nonprofit Leadership

Stakeholder relationships at nonprofits are complex, and effective leadership is a prerequisite to the successful management of any organization in the Third Sector. The primary focus for charitable organizations is frequently on contributors, but not-for-profits must also consider the interests of employees, granting agencies, community leaders, and (in the case of charities) recipients. Although the interests of some of these stakeholders are in tandem, in other instances, they conflict (donors, granting agencies, and community leaders might have different priorities, for instance). Effectively navigating the wishes of these different contingencies is fundamental to good leadership. Figure 1 provides a simple illustration of the stakeholder relationships, essential regulatory controls, and evaluative services that work together to promote successful management of nonprofits.

Although the focus of nonprofit managers in the charitable sector might be on donors, the structure of the donor-organization relationship is unique, in that small contributors receive little or no feedback on what their donations accomplished. Conversely, in most instances in the for-profit sector, businesses accept some responsibility to their most critical stakeholders, their customers. Lesser donors give and are forgotten (until the next fundraising cycle). It is this absence of a feedback loop that enables failed leadership at charitable nonprofits. The solution to this problem of poor management is oversight and accountability.

## Nonprofit Oversight and Accountability

Although nonprofits are not directly answerable to their routine donors, oversight of all charitable institutions is part of the federal statutes that govern 501(c)3 organizations. Nonprofits must file Form 990 with the IRS annually to maintain their status, and that form is open to public inspection. Approximately half the states in the USA require the public release of Form 990, at least for those organizations that are of sufficient size (set by individual state statute). It is, of course, up to donors to seek out the information on a charitable entity before giving, and most contributors do not. Charitable organizations that receive federal grants are subject to reporting requirements as part of that funding, which provides another layer of accountability for the minority of institutions that receive such support. Other forms of direct accountability are self-imposed to attract donors. Nonprofits may choose to conduct an independent audit (It has been argued that nonprofits should be subject to some form of Sarbanes-Oxley style of regulation (the federal law that makes for-profit executives personally liable for misdeeds at private corporations. No such federal law exists, and only California has adopted legislation of this kind.). Those that do generally make the results of that audit readily available on their webpage. Although one might assert that ***all*** nonprofits should be subject to this additional form of transparency, it is considered too burdensome for small organizations. Charities may also decide to adopt a governance structure that includes an independent voting board, providing an additional level of accountability.

Despite these layers of oversight – some voluntary, others not – outright fraud is not uncommon in the Third Sector. When nonprofits become rogue organizations, legal remedies include the removal of the entity's 501(c)3 status or, in the most egregious cases of philanthropic entities violating the trust of their supporters, prosecution by the Federal Trade Commission (see below). This ultimate failure of leadership is enabled by (as argued above) the lack of accountability to most donors in the nonprofit sector. Since those that give do not receive an accounting of how their donations were used, deceit is facilitated.

**Nonprofit Leadership, Fig. 1** Nonprofit stakeholders, regulation, and assessment – the foundations of accountability

In addition to these internal and external controls, most large nonprofits are subject to assessment by one or more independent organizations that provide detailed rankings of charitable institutions. As noted above, the largest of these, *Charity Navigator*, provides an evaluation for over 8,200 nonprofits, including detailed financials and information on each organization's management structure and accountability. Likewise, *Charity Watch* provides a similar evaluation for a smaller set of institutions, mostly large, well-known nonprofits. Although this type of oversight is important, the burden is still upon potential donors to seek out and utilize this information.

## Failed Leadership: When Charitable Nonprofits Go Bad

In 2015, the Federal Trade Commission accused four cancer charities of both misusing charitable donations and outright fraud (https://www.ftc.gov/news-events/press-releases/2015/05/ftc-all-50-states-dc-charge-four-cancer-charities-bilking-over). All four organizations raised funds by promising to assist cancer patients through financial support for the purchase of medications, hospice care, etc. In reality, contributions were used to purchase vehicles and vacations, with the rest spent primarily on professional fundraising. This was just the most recent example of abuse of donors' generosity through the misappropriation of funds for personal gain (See *Charity Watch Hall of Shame*, available at charitywatch.org for examples of the most egregious violations. Alternatively, the *Tampa Bay Times* publishes an annual list entitled *America's Worst Charities*.). Although a variety of means are utilized by rogue charities to facilitate theft (including one organization that was essentially a Ponzi Scheme), common threads are:

- A "close" board, typically made up of family members or friends and associates
- Failure to conduct an independent audit that would have revealed the misuse of donations
- Absence of professionals in the core staff of the organization
- Excessive use of professional fundraisers
- A focus on causes that elicit an uncritical response from most who are solicited, including "support" of cancer patients, the police, veterans and children

Highly visible scandals at individual charitable organizations are likely to elicit calls for

tighter regulation of the sector as a whole; a move that probably would be welcomed by larger nonprofits but could be too onerous for smaller organizations.

## Conclusion

Successful nonprofit leadership is a result of a combination of factors, including leadership training and credentialing, appropriate oversight (internal and external), a regulatory environment that is appropriate to the unique circumstances of the Third Sector, and answerability to stakeholders. It is this final element that has remained elusive in the charitable component of the nonprofit sector, particularly in the relationship between charities and their occasional donors. In the absence of some form of feedback to contributors, misuse or misdirection of funds is facilitated. Few donors (less than a third) investigate a charity before giving, enabling nonprofit leaders to act in their own interests rather than those of their most important stakeholders. In the member-serving segment of the nonprofit sector, issues such as these are less likely to occur, as donor and recipient are one in the same, and the likelihood of fraud is diminished.

Good leadership extends beyond the individual nonprofit. When poor management of contributions (or facilitation of outright fraud) are exposed, the reputation of the sector as a whole is damaged. Rather than seeking out an alternative target for donations, some donors will simply forego giving. Despite the many layers of accountability described above, and the on-going effort to professionalize nonprofit management, the leadership deficit remains.

# Nonprofit Leadership, Relevance in a World of Changing Realities

Michael L. Gaylor
School of Public Administration – College of Arts and Letters, Florida Atlantic University, Boca Raton, FL, USA

## Synonyms

Bearing; Change leadership; Change management; Changing realities; Leader; Leader development; Leader training; Leadership; Materiality; Pertinence

## Definition(s)

| | |
|---|---|
| Leadership | The effective use of Influence to move people toward a common goal. The process of establishing a vision and through a passionate communication of that vision, amassing a followership that shares the same passion for and drive to achieve that vision. |
| Relevance, Relevancy, Relevant | A state of being where an individual or organization possesses Network Power (effective development of networks), Knowledge Power (possession of knowledge), and Personality Power (ability to inspire trust and enthusiasm from others) in amounts sufficient enough to influence change in organizations and communities. Engaged power equals relevance. |
| New Realities | The state of the social, political, and economic environment where there are rapid and often unpredictable changes in the state of things as they are or appear to be as compared to the way one might wish them to be. |

## Introduction

As leaders in the voluntary or nonprofit sector, there are many issues to which one must attend and skills and traits that one must possess. In a world of persistent change, leaders have focused on engaging in horizontal leadership development which focuses on information and external skill sets. This is very necessary but does not necessarily advance the nonprofit leadership pools' ability to effectively deal with the **new realities** often facing the nonprofit world. A stronger focus on vertical development or that which advances leaders' ability to be more adaptive and agile in the face of **new realities** might better ensure that leaders remain **relevant** in the eyes of their colleagues, followers, and community at large. Tending to the Habits of Relevancy might ensure that leaders develop relevancy at whatever stage they are in their careers and maintain that relevancy into the winter of their years. Consider the following **Parable of Russell T. Kann** (Gaylor 2013).

*Two nonprofits leaders were taking a stroll in the Bosque of the Rio Grande. One an emerging leader named Milly Enial. The other a more seasoned leader named Jenn Xer.*

*Their walk took them to the bank of the Rio Grande. While gazing at the water, Milly asked, "I wonder what will ensure that we will still have what it takes to be effective leaders into the future?"*

*Jenn responded, "Not sure… but I would imagine that we must keep our hard leadership skills strong. Being seen as an expert whose knowledge of leadership is deep and robust would be vitally important."*

*At that moment, Jenn and Milly's eyes were drawn to the river's edge where there rested a relic from which words of wisdom emanated. This relic, known as Russell T. Kann, was a well-worn soul with many signs of wear and tear. His friends may have called him Boomer.*

*To Jenn's views Russell retorted, "You are partially correct. But if you want to secure your futures as leaders, you must build a foundation for remaining **relevant** as the world around you changes."*

*"We, like our nonprofit organizations, must engage in the hard work of change if we are to remain **relevant** in an ever and rapidly changing world. So… remaining **relevant** is the golden key to leadership success over time."*

*"My friends never called me 'Boomer', but they do call me Rusty. So… Rusty Tin Kann am I. I have not always been a Rusty Tin Kann. At one time, like you, my outside was clean and fresh, without dents, dings and rust and I was shiny on the inside. Today I am well-worn but still shiny on the inside because I have adopted the critical **'habits of relevance.'** These habits have saved me from becoming **irrelevant.** These habits are:*

- *Committing to actively reading the world's **new realities**;*
- *Subscribing to **life-long learning**;*

- ***Mentoring*** *emerging leaders; and*
- *Adopting the traits associated with* ***Critical Thinking***

*Subscribe to these habits early in your career and you will ensure your relevancy throughout life." With that Rusty retreated to the serene ambience of the flowing Rio Grande.*

*Jenn and Milly quietly pondered his words and were grateful for their encounter with the wise, old mentor, Russell T. Kann.*

## The Habits of Relevancy

### Habit #1: Committing to Actively Reading the World's New Realities

The criticality for a leader to first establish a position of relevance in the organization and the community and then maintaining that relevance over time cannot be understated (Beerel 2009). Regardless of leaders' personal mission or leadership brand, it is of the utmost importance that the goal of remaining **relevant** is always at the top of their mind. If leaders allow their relevance to take a back seat to other priorities, their attraction from the followers' perspective may wane. They may find themselves engaging in dysfunctional behavior, personal decay, and ultimately disappear into a relevance abyss out of which they cannot climb; fading into a zone of irrelevance.

The development and maintenance of relevance is directly proportional to the leader's appetite to search for and respond to emerging **new realities**. Leaders often do not read the signs of impending **new realities** and when they do, they do not respond appropriately. **New realities** insidiously creep up on us as small virtually opaque events and ultimately reveal themselves as ominous game changers.

Consider the boiled frog fable. This fable describes a frog being slowly boiled alive. The premise is that if a frog is put suddenly into boiling water, it will jump out, but if the frog is put in cold water which is then brought to a boil slowly or incrementally, it will not perceive the danger and will be cooked to death. Although the results of this experiment have been questioned, it stills serves as an effective metaphor on how leaders can become irrelevant due to their failure to perceive change and the **new realities** that emanate from the change.

The struggle with dealing with new realities prepares us, in many ways, to approach our leadership with integrity and authenticity. As we unearth **new realities** and bring them into the light, we discover new truths. Much like the saying that what one perceives becomes one's reality, **new realities** equal new truths. The leadership challenge is to grapple with the truth while working toward alignment with that truth. This leads us to becoming change leaders as opposed to change managers.

#### Pledging to Be a Change Leader Versus a Change Manager

**New realities** signal the need for robust change. Change is the one factor that in today's world is a constant and sets in motion the generation of **new realities**. Irrelevancy is a direct by-product of a leader's miscarriage when it comes to facing change. When the world around the leader changes at a much faster pace than the leader changes, then irrelevancy sets in (Warren 2012, 0:37). Being blind to this fundamental reality puts the leader and the nonprofit organization in peril relative to future relevancy. Small, incremental changes add up to very large and sometimes catastrophic effects and place the leader in a position of peril relative to maintaining relevancy. These changes occur frequently and at a lightning pace. A leader's consciousness of these changes may be impaired due to a sense of contentment with the leader's station in the organization.

Change guru, John P. Kotter (2012) describes an eight-stage process for leading change. The first stage targets the need for change leaders to establish a sense of urgency around the needed change. Although this sense of urgency is the driving force behind motivating change, Kotter would suggest that leaders often fall into a pattern of complacency or contentment and as a result are not onboard when a new reality ship sails.

Being a **relevant** leader requires 70–90% leadership and only 10–30% management.

Therefore, in order for leaders to create a sense of urgency within themselves to change, they must focus on self-leading versus self-managing when it comes to moving the needle relative to self-change. We have come to know that management is a set of processes that can keep a complicated system running. When the leader is that complicated system, the focus is on "what" and "how" of mediating self-change. For decades, business schools have been teaching people how to manage.

However, in order for leaders to remain **relevant**, they need to experience a shift in consciousness which focuses them on the processes of leadership versus management. These leadership processes include creating their personal vision which defines what their future should look like, aligning themselves and others with that vision, and creating within themselves and others a passion for action despite the obstacles that will be in their way. Beerel (2009) suggests that in order for leaders to effectively navigate through this shift in consciousness, they must develop strong adaptive capacity and employ adaptive strategies (Leadership). This differs from engaging in technical capacity (Management) and deploying coping strategies. Coping strategies are less assertive, energy consuming, and creative than adaptive strategies. Coping resigns leaders to passively accepting the inevitable changes in their world. It is transactional leadership at its best. Whereas adaptation requires leaders to engage these changes head on and demand meeting these changes on their own terms. Adaptation requires deep and robust learning, risk-taking, alertness, agility, and energy. It is transformational leadership at its best.

Mature adaptive capacity provides leaders with improved chances of healthy survival and ongoing relevance in what is otherwise a very chaotic environment. It makes leaders more resilient.

So, if becoming a change leader increases the probability of ongoing relevance, why is it so hard to achieve? There are many reasons, but one of the most powerful obstacles of self-change is the presence of clashes of deeply held values and a requirement that the leader engage in self-transformation.

### Courageously Facing Loss and the Emotions Associated with It

Remaining **relevant** in a persistent and pervasively changing world will require leaders to examine their most closely held values and beliefs and, if necessary, modify or change those values to align with changing times. Identifying these value tensions is the first step in defining the adaptive challenge (Heifetz 1994). Once the adaptive challenges have been named, adaptive work begins.

This is a painful process because the leader's deepest and most closely held values have been formulating and morphing for many years. These values have been woven into a seemingly instinctual tapestry of impulses which drive the leader's perceptual, thought, problem solving, and decision-making processes to name a few. The tapestry is a reflection of the leader's soul and an expression of their humanity.

Responding to new realities therefore may require the leader to give up or mediate their values and this consequently results in immediate loss since something is given up. All change, good or bad, results in loss. Even change emanating from a welcomed new reality impacts one's self-esteem or sense of self (Beerel 1998; Heifetz 1994).

Mitigating the pain that comes from value tension may rest in understanding the two types of values, Terminal and Instrumental (Rokeach 1973). Terminal values refer to the goals a person would like to achieve during his or her lifetime. They include values like happiness, self-respect, recognition, inner harmony, leading a prosperous life, and professional excellence. Instrumental values on the other hand deal with views on acceptable modes of conduct or means of achieving the terminal values. These include being honest, sincere, ethical, and ambitious. These values are more focused on personality traits and character.

Values and belief systems may consciously or unconsciously drive us to certain work environments which are congruent with those values. When the environment changes and no longer supports our closely held values, we may be tempted to move onto greener pastures. However

tempting this may be, with the volatility that exists in today's environment, leaders may find themselves moving from one company environment to another with some degree of regularity.

Vlachoutsicos (2013) suggests another solution. Although authenticity is an admirable virtue, it can get one into trouble if personal values clash with environmental realities. Therefore, it is suggested that one prioritize their terminal and instrumental values. Then if the need arises, make decisions about which values are most important given the situation. This may seem like a game of manipulation, but it can be effective in mitigating any values discord. Once the values dissonance subsides or is remediated, then the leader can focus on the issue of relevance as it relates to exercising power.

### Exercising Power in a Legitimate Fashion

Nonprofit leaders often shy away from the concept of power because it has historically been seen as the shadow side of leadership and as a tool used for the wrong purposes. Yet the amassing of power and use of it, regardless of its tainted image, for the purposes of advancing a venerable mission is not only wise but necessary in a rapidly changing environment.

Power and relevance go hand in hand. Leaders who are seen as powerful are those who can get things done and are therefore **relevant**. A leader who is without power loses their seat at the table and therefore their ability to influence. As a result, the leader is relegated to a position of irrelevance.

It may be instructive for nonprofit leaders to assimilate the lessons learned about the effective use of power from their social activist counterparts. These leaders work to create change and remain **relevant** influencers in the community. They hold a sophisticated view of power and typically utilize different approaches as necessary to effectuate change. These approaches include "power over" and "power with" as first described by Mary Parker Follet (Teske and Tetreault 2000; Mele and Rosanas 2003).

The type of individual power which is most known but also most misused is positional power or "power over." This is power which is accumulated as a result of the leader's role, title, and position. This type of power may be the least effective way of remaining **relevant** because of an evolving culture where deference to power is becoming lower.

On the other hand, power which is created as a result of effective development of networks (Network Power), possession of knowledge (Knowledge Power), and the ability to inspire trust and enthusiasm from others (Personality Power) carry with them the theme of "power with" and will be very effective in growing one's relevance in the community. These sources of power could best be described as Relational or Engaged Power. When a leader is viewed as significant, it means they exercise power that has traction when engaging others. Engaged power equals relevance.

In Gamson's work on power relative to change (1968, 1990), it is suggested that there are two different kinds of power; **Power-in-Repose** and **Power-in-Use**. Power-in-repose is potential power and represents the bank of personal power assets that the leader has built. It is a way of conceptualizing the leader's intrapersonal strength. Power-in-use is manifested in real outcomes or concrete changes that the leader has driven. Power-in-use can be further broken down into two distinct categories. The first is the gaining of new advantages. A leader's power is determined by whether they can bring about the specific outcomes for which they battle. The second kind of power-in-use is the gaining of acceptance. Does the leader have a seat at the table? The degree of strength a leader possesses in each of these categories will translate directly to their position of influence in the community.

In order to subjugate positional power and advance relational power, leaders must be comfortable in their own skin. Only self-aware, self-reflective, and secure leaders can employ relational power to secure their place of influence in the community.

## Habit #2: Subscribing to Life-Long Learning

Achieving and maintaining relevance involves a commitment to the hard work of learning. Much like adaptive organizations which are fundamentally continuous learning organizations (Argyris

1999), adaptive leaders must be life-long learners. In order to strengthen one's adaptive capacity, adaptive strategies must supplant coping strategies. This requires a promise to build one's theoretical and applied knowledge bank and be prepared to share this knowledge with everyone who has a stake in making the adjustments needed to successfully face **new realities**. More importantly, leaders need to go beyond the acquisition of new information and enter the realm of transformative learning where they create for themselves new understandings, paradigms, strategies, and behavior. The adaptive leader is more than a creative, inventive, and risk-taking trailblazer. They engage learning in a way that allows them to "know differently" through exploring, inquiring, searching, and reflecting and in the end knowing for the first time.

To that end, the foundational characteristics of a learning leader include the following (Beerel 2009, p. 20):

The leader. . ..

- Is open to **new realities** in the environment.
- Allows **new realities** to flow in and does not block, check, filter or unduly try to control them.
- Looks at the **new realities** from multiple perspectives and conducts reality checks for each new reality.
- Recognizes that **new realities** require new learning and that learning is experiential so risk taking becomes an accepted practice.
- Recognizes that learning is affective as well as cognitive, so self-reflection becomes an accepted practice and emotions are named and managed.
- Reaches out in a multidisciplinary way to gain a broader perspective on the learning that is taking place
- Seeks active and constructive feedback regarding conclusions that are being drawn relative to the learning that is taking place.

The following definition of insanity, "doing the same thing over and over again and expecting different results" (Einstein n.d.) may explain some failures in executing adaptive strategies. Leaders may seem insane in that they hold onto and execute the same intervention strategies that have left them falling short in the past. Discarding or revisiting entrenched behaviors or old problem-solving strategies becomes more and more difficult as time goes by. They in fact become habits which are implemented without thought or care.

Therefore, unlearning is a very necessary part of the learning process. If a leader is to adapt, they must be prepared to unlearn, give up, reorient, and change.

A leader who engages in life-long learning is certain to remain a person of influence. Adopting the traits of a critical thinker will enhance the leader's learning process.

### Habit #3: Mentoring Emerging Leaders

Being an effective mentor brings with it a cache of relevance chits regardless of one's stage in their professional career. Although being effective as a mentor is blind to age, as neophyte leaders face **new realities**, it is most valuable to have a mentor who is in or approaching the winter of their careers. Why? It is so because as mentors who are in the Mature Adulthood stage of their careers (Ages 50–80) are blessed with the gift of Benevolence (Armstrong n.d.). These mentors have had vast experience, established themselves in their work life, and become contributors to the betterment of society. They have and may continue to work toward the betterment of the community. **New Realities** have become a part of their existence and if they have developed the **habits of relevance,** they likely have learned many lessons from their successes and failures in navigating these **new realities**. Chances are many have benefited from their benevolence and without a doubt, we all can learn from their example to give more of ourselves to others. For those clearly in the winter of their careers, late Adulthood age 80+, wisdom is their mantra (Armstrong n.d.). These mentors have lived long lives and have amassed a wealthy bank of experiences that they can use to help guide others. Elders thus represent the source of wisdom that exists in each of us, helping us to avoid the mistakes of the past while reaping the benefits of life's lessons (Armstrong n.d.).

As a young leader, facing **new realities** without the experience of having to deal with the ambiguity often attached to these **new realities** can be ominous. Yet, although overwhelming,

there remains a strong desire to succeed. As emerging leaders climb the leadership ladder, there is one common problem that sets the bottom of the ladder on fire. That is, not having a trusted advisor to help them navigate the **new realities**.

This is where mature leaders can maintain their relevance. They can serve as the trusted advisors to the new generation of leaders. The emerging leaders' supervisors are typically and understandably immersed in transactional leadership activity. The wise mentor, on the other hand, can engage the emerging leader in a relationship which is transformational in nature.

The wise leader knows that transformative change results from engaging in deep and robust learning. They also know all about the pain associated with that learning; the testing of one's self-esteem and sense of self. The wise mentor, who has been engaged in the **habits of relevance**, will be able to impart knowledge and exemplify through their experience how they have discovered how to face **new realities**. They have the luxury of being both the "sage on the stage" as well as the "guide on the side."

The inner workings of mentoring vis-à-vis executive coaching are a subject for another time. Suffice it to say that evolving into an effective mentor will ensure one's relevance into the future.

### Habit #4: Adopting the Traits Associated with Critical Thinking

Foundational to a leader's development and maintenance of relevance is the ability to think critically. The process and implementation of the skills related to critical thinking serves as the driving force behind the other three **habits of relevance**; reading the world's **new realities**, subscribing **to life-long learning**, and **mentoring** emerging leaders. And, like these other habits, the engagement of critical thinking is not a process without pain. The popular exercise motto, "no pain, no gain" promises greater rewards for the price of hard and even painful work (Exercise Motto 2020). Under this conception, it can be deduced that leaders who are on the path of ensuring their relevance will certainly be required to endure pain (mental/emotional suffering) to be successful in that quest. David B. Morris (2005) wrote "'No pain, no gain' is an American modern mini-narrative. It might reflect the story of a nonprofit leader who has come to understand that the road to successfully facing **new realities** runs only through hardship."

Critical thinking thought leaders, Elder and Paul (2013), suggest that leaders don't have to work at being self-justifying, self-serving, and self-deceptive thinkers. It is a natural state of being for most people. Therefore, only through critical thinking can leaders change whatever needs changing in their thinking process in order to be successful in their pursuit of relevance. There are three components to developing as a critical thinker (Elder and Paul 2012); Standards, Elements and Intellectual Traits. Although each of these is paramount to developing as a critical thinker, the Standards and Elements are more viewed as external skill building processes whereas the development of Intellectual Traits requires the leader to engage in deep intrapersonal reflection and change if they are to become **relevant** thought leaders. The ability to ferret out the most perilous of **new realities** bombarding the leader will require them to be fair-minded thinkers. A fair-minded thinker is one who has the "...predisposition to consider all **relevant** viewpoints equally, without reference to one's own feelings or self-interests, or the feelings or selfish interests of one's friends, community or nation..." (Elder and Paul 2012, p. 5). The focus, therefore, will be on developing intellectual traits.

- Intellectual Humility Versus Intellectual Arrogance

  The leader must be comfortable in conceding to the limits of their knowledge. They must also be conscious of how their native egocentrism may function to lure them into drawing conclusions which are not grounded in logic but are a function of self-deception, bias and prejudice. The abandonment of intellectual arrogance will aid the leader in dealing effectively with **new realities** and move the needle in the direction of developing and maintaining relevance in the eyes of their followers.
- Intellectual Courage Versus Intellectual Cowardice

N

The leader must be content in examining ideas and beliefs which imbue in them negative thoughts and emotions. The leader must courageously examine ideas and beliefs which for them may on the surface seem precarious or ludicrous. In giving these ideas a fair hearing, the leader may come to know that these ideas may have some validity and bear some truth. Embracing Intellectual Courage will aid the leader in dealing more effectively with **new realities** and move the needle in the direction of developing and maintaining relevance in the eyes of their followers.

- Intellectual Empathy Versus Intellectual Narrow-Mindedness

  The leader must be adept at placing themselves in the place of others to gain a sense of understanding of others' viewpoints and belief systems. This too will take the focus off the leader's self-centered conclusions about reality and allow room for differing realities. This process will conjure up memories of how the leader came to realize that they were wrong in the past, even though they had very powerful beliefs that they were right. The ability to be Intellectually Empathic by being able to walk in another person's shoes will aid the leaders in dealing effectively with **new realities** and move the needle in the direction of developing and maintaining relevance in the eyes of their followers.

- Intellectual Autonomy Versus Intellectual Conformity

  Leaders may have learned that the path to least resistance is found when one "goes along to get along." Conforming to the socio-centric beliefs of one's family, ethnic group, religious sector, political party and so on represents narrow-minded vs. fair-minded thinking. Leaders who are willing to think for themselves and take a stand which may be unpopular are not only autonomous thinkers but courageous ones as well. The courage to be an independent/autonomous thinker will aid the leader in dealing effectively with **new realities** and move the needle in the direction of developing and maintaining relevance in the eyes of their followers.

- Intellectual Integrity Versus Intellectual Hypocrisy

  Integrity is a hallmark of ethical leadership. Integrity is found when what the leader says is congruent with what the leader does. They "walk the talk." Intellectual Integrity is present when the leader holds themselves accountable using the same rigorous standards that they may apply when judging another's values or beliefs. Being viewed as a hypocrite does not bode well for the leader who is pursing relevance. Leaders who imbue integrity into their being will deal more effectively with New Realities and move the needle in the direction of developing and maintaining relevance in the eyes of their followers.

- Intellectual Perseverance Versus Intellectual Laziness

  Leaders must be willing to push forward in their journey to find the truth despite the difficulties, obstacles and frustrations that will confront them. They must stay the course and adhere to the guiding principles which have launched them on this journey despite those who would be antagonistic to their quest or the unsettling nature of unanswered questions or opaque information. Leaders who doggedly persist in the face of adversity will deal more effectively with **new realities** and move the needle in the direction of developing and maintaining relevance in the eyes of their followers.

- Confidence in Reason Versus Distrust of Reason and Evidence

  Leaders are self-assured that in the long run their own and their followers' best interests will be served by giving reason free reign. By role-modeling the other intellectual traits and having confidence that everyone can grow into these traits, leaders will be able to effectively deal with **new realities** and develop and maintain relevance in the eyes of their followers.

- Fair-mindedness Versus Intellectual Unfairness

  Leaders not only abhor sophistry but challenge sophists through the effective use of critical thinking strategies. They are fair-minded in that they treat all viewpoints alike

without deference to their own egocentric or sociocentric proclivities. Leaders who are fair-minded will be able to effectively deal with **new realities** and develop and maintain relevance in the eyes of their followers.

## Conclusion

Leaders who aspire to be **relevant** in their work and maintain that relevance throughout their careers, well into winter of their professional life, need to embrace the **habits of relevance** and tend to them throughout their lives. In the words of Annabel Beerel, when facing **new realities** "mature adaptive capacities provide us with resilience. . .. and resilience improves the chances of healthy survival in a world of change" (Beerel 2009, p. 12).

Let us all strive to be **relevant** leaders.

## Synonyms

Answerability; Legitimacy; Liability; Responsibility; Transparency

N

## Definition

Accountability may be defined as "*the means through which individuals and organizations are held externally to account for their actions and as the means by which they take internal responsibility for continuously shaping and scrutinizing organizational mission, goals, and performance*" (Ebrahim 2003b, p. 194).

## Introduction

Accountability has become an increasingly important topic for nonprofit organizations (NPOs) in recent years, not at least as a result of major financial scandals in different nonprofit organizations around the world that have come to light. The scandals raised concerns about the current reporting and oversight mechanism of nonprofit organizations and increased the (public) pressure on NPOs to be accountable. But what are the notions of nonprofit accountability and to whom, for what, and how are NPOs accountable? (Ebrahim 2003b, 2016; Kearns 1994).

Numerous definitions of accountability have been offered by scholars and practitioners in the nonprofit sector. Accountability is often defined as "the means by which individuals and organizations report to a recognized authority (or authorities) and are held responsible for their actions" (Edwards and Hulme 1996, p. 967). Many definitions of nonprofit accountability typically emphasize accountability to donors, funding sources, and the government, and ensure that money is spent consistently with the donor's wishes (Christensen and Ebrahim 2006; Najam 1996).

This perspective focuses on the external dimension of accountability, where an external principal holds an agent to account (Ebrahim 2005). From this point of view, accountability is a reactive response to concerns about public trust. NPOs share information about their performance mainly due to external obligations (Ebrahim 2016), i.e., explicit standards codified in law, administrative regulations, or contractual obligations (Kearns 1994).

On the other hand, accountability has also an internal dimension, where accountability is motivated by feeling responsible, expressed through individual action and organizational mission (Ebrahim 2005; Fry 1995). Accountability is therefore also a proactive response to concerns about public trust, with a focus on improving performance and achieving the mission and long-term goals (Ebrahim 2016; Kearns 1994). These implicit performance standards are mainly defined by societal values, beliefs, and assumptions (Kearns 1994).

This discussion shows that there are several aspects to consider: accountability refers to "being answerable to stakeholders for the actions of the organization, whether by **internal or external** initiation" (Christensen and Ebrahim 2006, p. 196), especially through different performance standards –- **explicit or implicit** – that are generated by the strategic environment of the organization and the response from inside the organization which may be either **reactive or proactive** (Kearns 1994). Further, nonprofit organizations can be accountable on multiple levels: **upward** accountability, if the organizations are being held responsible by others, **lateral** as being responsible to staff and volunteers, and **downward** as being responsible to the needs of clients, which also includes the public trust. Lateral and downward accountability are both a result of an internally felt responsibility (Christensen and Ebrahim 2006; Williams and Taylor 2013).

Nonprofit organizations face multiple, and sometimes competing accountability demands: from multiple actors (i.e., **to whom**: upward – downward, internal – external, as well as hierarchical – holistic), for multiple purposes (i.e., **for what**: finance, governance, performance, and mission), and with different mechanisms to ensure accountability (i.e., accountability **how**) (Benjamin 2008; Ebrahim 2016). These key questions guide the description of the complex concept of nonprofit accountability (and its environment) in many scientific contributions in various research streams: accountability as part of a broader **governance** context; as a **marketing** tool, in which the accountability tools influence the attitudes of the organization's stakeholders

and reduce their uncertainty; or as part of the **quality management**, for example, through external certifications and accreditations (Becker 2018).

## Key Accountability Questions

### To Whom

Nonprofit organizations are expected to be accountable to multiple actors on multiple levels. In addition, these plural accountabilities change over time (Ebrahim 2003b).

**Upward** accountability refers to relationships with trustees, donors, and governments and is often focused on the use of funds. **Downward** accountability usually refers to relationships with groups to whom the organization provides services, i.e., beneficiaries and clients, although it may also include local communities, other affected constituents, public trust, or regions indirectly affected by nonprofit programs (Ebrahim 2003a; Edwards and Hulme 1996).

Some authors further differentiate between internal and external accountability; **external** to contractors and organizations active in the same or related field, the media, and society at large and **internal** (or **horizontal or lateral**) to staff members, volunteers, and board members in terms of goal attainment and the organization's responsibility to its mission (Ebrahim 2003a; Fry 1995; Najam 1996).

In summary, nonprofit organizations are expected to be accountable to multiple actors and must manage multiple accountabilities. These include private donors and foundations, funders, particular clients or beneficiary groups, nonprofit staff and board, volunteers, the members themselves, as well as legislators or policymakers, the media, and the public at large.

There are many difficulties in balancing these multiple responsibilities as they are in conflict with one another in many situations. Organizational stakeholders often articulate divergent demands which do not necessarily align perfectly with the organization (Knutsen and Brower 2010). Nonprofit accountability, therefore, refers not only to the fulfillment of the objectives of particular interests, it is about balancing, prioritizing, and choosing among multiple accountabilities, because equal accountability to all stakeholders at all times is impossible (Edwards and Hulme 1996). A particular important balance among competing objectives and interests is the balance between upward accountability to patrons while remaining true to the organizations' mission (Ebrahim 2016).

A major problem in this context is the so-called accountability syndrome, a mission drift in which nonprofit organizations dedicate a disproportionate amount of resources on being accountable (Anheier and Hawkes 2008). In contrast to the phenomenon of the need of having to "overaccount" due to multiple demands, there is also the problem of "underaccount," where each overseeing authority assumes that another authority is closely examining the actions, measures, and results (Edwards and Hulme 1996).

A further distinction in nonprofit accountability literature is O'Dwyer and Unerman's (2008) differentiation between hierarchical and holistic accountability. **Hierarchical** accountability is "narrowly functional, short-term in orientation and favors accountability to those stakeholders who control access to key resources for both resource use and immediate (campaign) impacts" (O'Dwyer and Unerman 2008, p. 803). Also called functional accountability in literature, hierarchical accountability focuses on control and external oversight of NPOs and considers only the most influential and powerful stakeholders. **Holistic** accountability "expands the concept of 'performance' articulated within hierarchical accountability to embrace quantitative and qualitative mechanisms concerned with signifying the long term achievement of organizational mission and the impact of this achievement in bringing about structural change" (O'Dwyer and Unerman 2008, p. 804). Holistic accountability refers to broader forms of accountability for the impacts that a nonprofit organization's actions have or can have, on a broad range of other entities, individuals, and the environment (Najam 1996).

Nonprofit accountability further varies across different types of organizations (Christensen and

Ebrahim 2006; Ebrahim 2016; Edwards and Hulme 1996). **Membership organizations**, such as cooperatives or self-help groups, combine internal accountability (to the members of the organization, which are internal) with downward accountability (to the clients who are members). In membership organizations, the mechanisms of accountability available to members include voting for the organization's leaders, revoking memberships and dues, or running for a leadership position (Ebrahim 2016).

In contrast, in **service organizations** the clients are external actors to the organization and therefore are usually not involved in creating the nonprofit in the way that members are. Except in highly competitive contexts, where clients have multiple service providers to choose from, clients of service organizations are often in a "take it or leave it" relationship with respect to the service offered. A key accountability challenge, therefore, lies in the downward accountability from funders to nonprofits and from the nonprofit to clients. The requirements of funders or patrons (i.e., upward accountability) are often very formalized, for example, through grant contracts, reporting requirements, and formal evaluations (Ebrahim 2016).

The third group is the **policy advocacy networks**, organizations where the members usually do not have access to organizational decision-making, or to other members and are more like clients of service organizations. Policy advocacy networks show characteristics that are common to membership as well as service organizations, and also characteristics that are unique. The accountability mechanisms are more advocacy oriented, such as lobbying, litigation, protest, negotiation, fact finding, and transparency in the reporting on information (Ebrahim 2016).

## For What

Nonprofit organizations are not only accountable to different actors but also for different things. Literature subsumes under the "for what" question different dimensions of accountability and describes the core area(s) for what NPOs can be held accountable. Similar to the definition of accountability, also the "for what?" question is not consistently answered and different authors name different dimensions or categories for what NPOs could (or should) be accountable. Nevertheless, one of the most commonly understood notions of accountability is accountability for finance (Behn 2001). Beside financial accountability, literature names accountability for performance. Other categories are accountability for governance and for mission (Behn 2001; Dainelli et al. 2013; Ebrahim 2016), although this is not a complete list of categories discussed in literature. It has to be emphasized that these categories cannot be clearly separated; they overlap and influence each other. For example, Behn (2001) mentions that holding someone accountable for performance and at the same time for finance can result in a dilemma – the accountability dilemma – as rules for finance can impede performance.

### Accountability for Finance

Financial accountability is the most obvious form of accountability (Behn 2001) and focuses on financial accounting, i.e., "how the books are kept and how the money is spent" (Behn 2001, p. 6), which became almost a synonym for accountability in general. So, the "For What?" question can be answered with "for the money" and accounting provides tools and instruments to account for the money. Thus, financial accountability is about tracking and reporting on the allocation and utilization of financial resources. In this relation, two questions arise, first: Where did the money go? And second, *"Was it spent on the people and things for which it was supposed to be spent?"* (Behn 2001, p. 6). Compared to other categories, accountability for finance is a quite straightforward concept and gains attention in the public due to accounting scandals and crises, which lead to policy responses like greater disclosure of financial transactions, transparency in the use, and oversight of funds, but also protections for whistleblowers. In general, financial accountability relies on law, regulation, and agreement combined with sanctions for noncompliance (e.g., fines, imprisonment, or loss of tax-exempt status). Behn (2001) explains financial accountability very simple, in the first

step values have to be defined that organizations should uphold, then these values have to be specified as rules, procedures, and standards (dos and don'ts). Next, a reporting system has to be set up to show compliance with the rules, procedures, and standards. And the last step, another organization is entrusted to audit the reports to whether the organization has complied with the previously specified rules, procedures, and standards.

### Accountability for Performance

Nonprofit organizations are not only accountable for the use of financial resources but also for the results they deliver. This form of accountability is about the consequences of the action of a NPO, and if the activities of a NPO produce the results that they were designed to produce. For holding a NPO accountable for their performance, one has to define the expectations for the outcomes that a NPO should produce, the consequences that it will create, or the impact that it will have (Behn 2001), which is closely related to the organization's mission and performance targets. In contrast to financial accountability, rules, procedures, and operational standards are less useful when it comes to accountability for performance, thus some kind of objective, goal, or target a NPO should achieve are needed and as such this form of accountability is induced by the funders, who require clear outputs and outcomes. Therefore, tools and instruments from performance measurement and indicator development can be used to develop metrics that cover inputs, outputs, outcomes, and impacts. This form of accountability does not come without critics, as performance measurement can result in measure fixation – an emphasis on the performance indicator itself rather than the underlying objective – which can lead to a tendency to quick fixes. This is contrary or conflicting with the work of NPOs (particularly those in relationship building and empowerment-related work), whose effectiveness has to be measured in the long term and goals are related to political and social change, which are difficult to measure, due to potential bias of external factors or confounders (Ebrahim 2016).

### Accountability for Governance

Accountability for governance is less often named by the literature as a category of accountability (like Ebrahim 2016). Accountability for governance is about the role of the board of directors, who need adequate information for decision-making but are also responsible for disclosing conflicts of interest and for acting within the organization's mission. The board should oversee financial issues (overlaps with financial accountability), but also internal controls and legal compliance. Nevertheless, boards are more and more responsible for the performance of a NPO, for the strategy, and for developing a mission to create social value (Ebrahim 2016).

### Accountability for Mission

Accountability for mission is closely related to accountability for performance but is more extensive. The view is long term and relates to learning, as social problem-solving is a complex process with many uncertainties, repeated trials can generate new insights for nonprofit managers on how to achieve the objectives of the NPO. In this regard, the board can monitor performance and compare it against the mission by considering the external changing circumstances. As nonprofit managers learn more about the social problems they try to solve, the objectives and strategies of a NPO should be adapted as well. Therefore, nonprofit managers should implement adequate processes for reflection and adaptation, but at the same time have to focus on solving social problems (Ebrahim 2016).

## How

Accountability "How?" is about the mechanisms of accountability available to NPOs to be accountable to multiple actors ("To Whom") and for multiple purposes ("For What"). Literature differentiates between tools and processes. Tools are instruments or techniques to achieve accountability, whereas processes are the course of action itself rather than an end product, e.g., participation or learning. Therefore, processes are broader and more multifaceted. Below, some accountability tools and processes are presented as examples.

### Financial Reporting

One of the most prominent tools for accountability is disclosures of financial reports. In many countries, boards set financial accounting and reporting standards for businesses and NPOs, thus financial reports or filling in tax forms are required, for example, to gain tax exemptions. Besides, in many countries, legislative requirements exist to make financial reports publicly available or available to interested persons, if the organization exceeds a certain size. Accounting information should be verifiable, free of error and bias, and represents faithfully events that occurred. In addition, accounting information should be relevant, which means it can influence decision-making, therefore it has to be timely, helps in prediction making, and confirms or corrects users' expectations. Reporting and accounting systems can enhance support for NPOs, as donors get more and better information for their charitable decisions (Keating and Frumkin 2003). Beside legal disclosure requirements, stakeholders (e.g., donors) require reports from NPOs they donate to, but these reports vary widely. Financial reports are externally enforced by threats of losing tax exemption or donations, thus these tools belong to the external approaches to accountability and are criticized for having only limited influence on internal responsibilities for mission, values, or performance (Ebrahim 2016).

### Evaluations and Performance Assessments

As the value of NPOs is not measured by the money they spent, but by the results they deliver, NPOs are not only required to demonstrate their financial performance but also if they perform and whether they are managed efficiently and effectively. This puts NPOs under increasing pressure to implement performance management systems or to conduct program, performance, and impact assessments or evaluations, which can be self-evaluations and external evaluations. The focus lies less on how they used resources (inputs, like funds raised, number of employees, and volunteers), but rather on short-term results like outputs of certain programs (e.g., number of clients served) or on medium- and long-term results (outcomes and impacts like improvements in client health). In particular, the latter are difficult and expensive to measure and come with certain problems like external factors which are often beyond the control of the respective NPO (Ebrahim 2016; Greiling and Stötzer 2015).

### Self-Regulation and Certification

In addition to the above-mentioned accountability mechanisms, there is also a tendency towards self-regulatory initiatives like voluntary codes of conduct and certification schemes. NPOs can develop or join voluntary mechanisms also called voluntary clubs, which should send a reliable signal of reputation and quality to the stakeholders or the general public. Such voluntary mechanisms require the adoption of certain policies and setting activities beyond legal requirements, which is costly for the NPOs but creates the benefit of a good reputation for all its members and the process of certification can stimulate organizational learning. Thus, such self-regulation clubs usually require the disclosure of certain information as well as a certification (self-certification, peer certification, or independent agent/third-party certification) and have sanctioning mechanisms for noncompliant members (Prakash and Gugerty 2010).

### Participation and Dialogue

Participation and dialogue as an accountability mechanism are processes rather than tools and reach from public meetings and hearings to involvement in NPO activities or projects to participation in decision-making processes, the latter can be called dialogue-based accountability and is an ongoing process and not an end-stage activity. It is essential, to gain stakeholders' preferences, needs, and demands so that they have a voice in the decision-making process in the NPO. In particular, web-based mechanisms like feedback forms, online surveying, and polling tools offer different possibilities for participatory decision-making and problem-solving. The output of these processes can be interactive contentment, tools, and services particularly designed for specific stakeholders (Saxton and Guo 2011).

## Conclusion

Nonprofit organizations are expected to be accountable and thus have to deal with accountability questions. Although there is not a universal definition of accountability for NPOs, this contribution has presented the notions of nonprofit accountability structured along the key questions around accountability: accountable to whom (upward – downward, internal – external, as well as hierarchical – holistic), for what (finance, governance, performance, and mission), and how (financial reporting, evaluations and performance assessments, self-regulation and certification, participation, and dialogue).

The article discussed the various aspects of accountability, provided an overview of the accountability pressures nonprofit leaders face, and examined different accountability mechanisms available.

# Nonprofit Organizations

Grzegorz Michalski
Department of Labor and Capital, Wroclaw University of Economics, Wroclaw, Poland

## Synonyms

501(c)(3) corporations; Charitable nonprofit; Charitable organization; Charity; Community foundation; Foundation; Nonbusiness entity; Nongovernmental organization (NGO); Nonprofit corporation; Nonprofit-making organization; Not-for-profit organization; NPO; Philanthropic institution; Public charities; Social economics organization; Social entrepreneurship; Tax-exempt entity

## Definition

Charity is a type of nonprofit organization that is focused on fixing social problem of people who have no possibility to cover the full cost of social services that are delivered to them by the charity.

Donor is an individual (person, firm, other entity) who appreciates the social value generated by realization of the mission realized by nonprofit organizations. Such appreciation results in supporting nonprofit organizations by donor's financial contributions, work, time, or other resources that can be spent to reach a better realization of the nonprofit organization's mission.

Foundation is a nonprofit organization concentrated on serving society by delivering support to ideas or actions that do not need to have charitable or philanthropic characters (Ralser 2007). Foundations usually serve culture, promoting history, managing property, or copyright to particular ideas or conceptions.

Nonprofit organization may be defined as an entity that is concerned with the realization of the social value of the organization's mission. Such a mission is realized due to sources collected through donations from donors, voluntary actions of supporters, public grants from state or local governments, and from various groups interested in better world building through the realization of the nonprofit organization's mission.

Nonprofit-making organization is a type of organization that has neither the goal nor the ability to generate a profit. This group of nonprofit organizations is usually concentrated on the voluntary work of supporters and has no income but is constrained by the redistribution of goods, work, and other flows, capital or assets to final beneficiaries.

Nongovernmental organization (NGO) is a kind of nonprofit organization that is managed and was launched by individuals who have no connection to the state or local governments. Part of nongovernmental organizations can cooperate with state or local governments, but this cooperation is on the basis of public grants from governments to nonprofit organizations.

Social economic organizations are concentrated on the realization of programs and services that benefit society in building a better world but with the use of a key performance philosophy. Social economy organizations are well managed in an as best as possible way and often generate not only social added value but also economic social value.

## Introduction

Not-for-profit organizations can operate as state governmental/local governmental depending on the entities or as nongovernmental organizations (NGO) when it is independent from states or international governmental organizations. Most nonprofit organizations are NGO's and operate as independent from official government programs. Nonprofit organizations can be non-profit-making organizations when they do not generate any profit nor is it possible that they generate profits as a side effect of their activity. Usually nonprofit organizations generate profits, and they spend it for better realization of their mission in future periods. Majority of nonprofit organizations are social economic organizations; that means that their activities are helpful for the realization of social aims like fighting against

illiteracy or lack of education, increasing security, decreasing social inequalities, fighting against diseases, protection from damage of technical, human, or social infrastructure, or actions for construction of new infrastructure. A large part of nonprofit organizations has religious character and are concentrated on the development or promoting of religious activities, cults, or ideas. Depending on local or state laws, nonprofit organizations can obtain tax-exempt status.

## Differences Between Nonprofit Organizations and For-Profit Organizations

Nonprofit organizations are a kind of organization that from the managerial side, they are almost identical as for-profit businesses. This is true, especially in cases of social economy organizations. Nonprofit organizations use similar pro-efficiency and performance solutions like for-profit businesses. Nonprofit organizations as entities offer unpaid and paid products and services, and as nonprofit organizations, they are allowed to generate even large revenues sufficient to cover costs of realization of their mission, but nonprofit organizations have no right to collect equity capital through stock issuing and have no stockholders. The main difference between nonprofit organizations and for-profit businesses is an economic calculation and financial motivation of the staff, capital providers, and the entire population of stakeholders. There is a difference in treating the entitlements of people who control organizations in prohibiting distribution of earnings and excess revenues over the expenses of organization: Equity type capital providers of for-profit firms can expect return of their money in the case the business makes excess revenues over expenses from operations. Nonprofit organizations do not have the right to issue stock, and the equity of nonprofit organizations is issued by donors and persons who have no right to express control over the nonprofit organization. Equity type capital providers of nonprofit organizations, in case the nonprofit organization generates money or excess revenues over expenses from operations, can consider additional support for the organization but have no possibility to withdraw the money previously tied to the organization. In nonprofit organizations, there is no equity capital, but nonprofit organizations collect fund capital which is an equivalent of equity capital. Fund capital is collected in nonprofit organizations by earning excess revenues over expenses that are forced by regulations as money that should be retained within the nonprofit organization. Other sources of fund capital are receiving contributions from individual persons or from private or public entities and from for-profit businesses. The last possibility to collect fund capital is money from grants received by nonprofit organizations from governmental entities. Calabrese (2011a) indicates that nonprofit capital structure choices are best explained using the pecking order theory. That means that in nonprofit organizations internal funds are used more likely than external borrowing.

Nonprofit organizations act because of expected future advantages measured by realization of ideas and mission that are expression of the donors' vision of the world. Both nonprofit and for-profit entities have an aim, a result of its owner preferences. For-profit organizations are active because of expected future advantages measured in money; non-profit organizations do their business because of expected future advantages measured by the degree of realization of their mission.

## Nonprofit Organizations Area of Activity

Nonprofit organizations serve in each area of social activities and depending on its size, can be registered or not by internal revenue authorities. The following among nonprofit organizations can be listed:

- Educational businesses like universities or schools
- Healthcare organizations like hospitals
- Charities working as religion institutions, branches, and similar

But that is not a closed list. Nonprofit organizations operate in almost each area of contemporary and modern societies. Always as it is possible

to fix any named or unnamed social problem, nonprofit organizations create a new value for making peoples' life better, there is a place for launching nonprofit nongovernmental organizations.

## Tax Exemption and Governmental Grants

Generally nongovernmental nonprofit organizations can be supported by the state in financial and nonfinancial ways. Nonfinancial support is reflected by regulations by the state or by governmental practices that help nonprofit organizations in their operations (Svidronova 2013). Financial support can serve nongovernmental nonprofit organizations as governmental grants or direct payments delivered to the nonprofit organization in the form of donations from state or local government budgets. State governments and local governments are interested in realization of their own commitments to society and can involve nongovernmental organizations by offering to them money in the form of grants, subsidies, or donations in exchange for nongovernment nonprofit organizations' activities that are in accord with state governments or local governments duties. Other forms of financial support from states or governments are various tax exemptions. Such a tax exemption may vary depending on the country and its local regulations. If states or local governments allow any tax exemption, there is practiced tax exemption from all excess revenues generated by nongovernmental nonprofit organizations or, what is much more logical, only such income-earning activities are tax exempted that are closely linked to the nonprofit organization's primary services and programs driven by the mission of the organization (Zietlow et al. 2007).

In the USA, several dozen types of tax-exempt nonprofit organizations are defined by the Internal Revenue Code (IRS). Public charities recognized by the Internal Revenue Code are categorized as 501(c)(3), and they are the largest category of nonprofit organizations (Pettijohn 2013). According to Pettijohn (2013) in the USA in 2011, there were almost one million nonprofit organizations. That group represents three-fifths of all registered nonprofits. Among other registered nonprofits, public charities grew more quickly during the last 15 years and public charities made up a slightly larger share of the nonprofit sector in that time (Pettijohn 2013).

Because of the benefits to society generated by nonprofit organizations, most governments allow tax exemptions both for donors and for the nonprofit organizations. Such tax exemptions are usually limited only to *charitable* nonprofit organizations, which are listed on government records of such organizations that meet the conditions for tax exemptions. Usually governments decide that according to their policy only the largest and the most useful for fixing societal needs and the most helpful for people of society have the right to tax exemptions, and of course the definitions and understanding of *usefulness* or *helpfulness* differ from country to country and depends on the dominating philosophy or religion of local societies. Tax exemption for the nonprofit organization could be for all money generated as profit in these organizations but more popular is a solution where only profits that are in effect for the realization of programs or activities concerned with the main mission of nonprofit organization are the basis for tax exemption, and other profits are subject of normal taxation. Such a solution helps to prevent situations when under the nonprofit banner is hidden full for-profit activity not concerned with social needs and is not helpful in leveling the disabilities of weaker participants of social interaction. Usually nonprofit organizations to keep tax exemption status are required to keep all excess revenues for the realization of the mission of the nonprofit organization. There is not a custom among governments to allow nonprofit organizations to pay out money from excess revenues over expenses to anyone who normally deserves it in for-profit entities. Board members, employees, and clients of nonprofit organizations are excluded from receiving dollars that are larger than average expenses. Each amount of any money in nonprofit organizations should be directed to beneficiaries defined by the mission of the nonprofit organization.

## Conclusion

Nonprofit organizations are growing in their significance. The number of new businesses led as nonprofit organizations is much higher than the number of for-profit businesses. Nonprofit organizations are employers for about ten percent paid employees in modern countries (Zietlow et al. 2007). Nonprofit organizations are entities that have realization of their mission as their prime aim. That gives us a prime managerial problem that nonprofit organizations have to solve: managing current assets, mainly having levels of cash sufficient to cover all needs connected with realization of the mission (Michalski 2012). Without such perspective, nonprofit organizations will have no possibility to serve societies answering their needs laying on the fundaments of nonprofit organizations' philosophy and mission. Covering needs connected with realization of the mission, part of nonprofit organizations uses the high debt to total assets strategy, which is intuitive for nonprofit organizations managing teams but can be fatal for future possibilities of the nonprofit organization to realize its mission in future periods of time (Jegers 2011; Brigham and Ehrhardt 2014). Much more safe for the realization of the mission strategy should be using currently known and maintained nonprofit organization sources without using debt at all or in limited amounts and at minimal scale (Michalski 2012).

Nonprofit organizations differ from country to country and from culture to culture. They have different aims defined by their missions and in various levels are supported or unsupported by local communities and local governments. Sometimes governments are in open conflict and are fighting against state or local governmental policy or practice. At the same time, the blessing and curse of nonprofit organizations is use of governmental grants that support realization of the mission of the nonprofit organization that is a beneficiary of such support (Vacekova and Svidronova 2014). That governmental or state grant is a deadly threat for nonprofit organizations and financial independency in the future and is, in fact, a source of denial and mishandling of nongovernmental organizations ideas and their spirit.

# Nonprofit Organizations and Discrimination

Brandi Blessett
Rutgers University-Camden, Camden, NJ, USA

## Synonyms

Citizen participation and engagement; Cultural competence; Discrimination; Social justice

## Definition

Institutional racism: the collective failure of an organization to provide an appropriate and professional service to people because of their color, culture, or ethnic origin. It can be seen or detected in the processes, attitudes, and behaviors, which amount to discriminatory outcomes. Institutional racism may occur through unwitting prejudice, ignorance, thoughtlessness, and racist deeds (despite intent). This conduct often results in stereotyping and consistently disadvantages minority ethnic people.

## Introduction

Nonprofits represent the "third" or voluntary sector in society. In this role they fill a gap in service delivery left vacant by public and private entities. These gaps are often left in underserved areas. For example, budget cuts in under-resourced communities have resulted in nonprofit organizations offering assistance with health and childcare, recreation, and education and employment training. In many cases, nonprofits have become essential service providers to communities deemed undeserving by local governments.

There is considerable variation among nonprofits regarding the types, structure, geographical location, services provided, and communities served. Regarding issues of diversity (or lack thereof), nonprofit organizations are indicative of a larger societal complacency that sustains the status quo (e.g., white affluent heteronormativity) when it comes to power, authority, and resource allocation. Underrepresented people and communities, therefore, are marginalized from opportunities based on a lack of access and/or due to social conceptions that deem them as incapable of being experts in their own experience. Despite the good intentions of nonprofit organizations, their status quo response to people and communities of color contribute to widespread marginalization. In other words, nonprofits often disempower individuals and communities based on their inability to share and distribute decision-making across impacted stakeholder groups.

While the communities served are often heterogeneous with respect to any number of primary (e.g., race, gender, ethnicity) and secondary (e.g., class, educational, and religious background) characteristics of diversity, the nonprofits themselves (e.g., board composition, executives, administrators) are consistently led by white affluent men. This juxtaposition results, consciously or unconsciously, in the continued marginalized status of underrepresented groups based on paternalistic assumptions about people and place. So, while nonprofit organizations seek to "help" communities, they are not immune to stereotyped assumptions about worth, ability, capacity, and sufficiency. As a result, nonprofits reflect other parts of society still struggling to be responsive to a multicultural and multiracial citizenry. This essay addresses the myriad of ways discrimination is embedded in the structure, operation, and outcomes of nonprofits in the USA and globally.

## Structure

Hayes (2012) notes, "Currently, nonprofit employees are approximately 82% white, 50% African American, 5% Hispanic/Latino, 3% other, and only 1% Asian/Pacific Islander. Employees of color make up 14% of leadership or upper management roles, and less than 6% of specialized positions" (para. 2). These statistics reveal a disparity with respect to who the decision-makers are in a community, especially as nonprofit organizations are significantly concentrated in diverse urban areas. Essentially the demographics of nonprofit organizations are on par with public and private agencies, relatively homogenous in an increasingly heterogeneous society. Overall this lack of representation in public and private institutions spurred the protest movements in the 1960s by civil rights, women's and lesbian, gay, bisexual, transgendered, and queer/questioning (LGBTQ) groups who wanted to be part of these respective organizations, as administrators, mangers, decision-makers, and stakeholders. Despite the few successes of the time (e.g., Affirmative Action and Equal Employment Opportunity legislation), more still needs to be done to effectively address long-standing institutional racism and systemic discrimination. The goal of activism in the 1960s was to promote the targeted and deliberate recruitment and hiring of historically marginalized groups, thus leading to increased access and opportunity, better engagement and participation, and improved service delivery for underrepresented groups. However, for every step forward, subsequent court rulings have limited the intentionality of Equal Employment and Affirmative Action laws to actualize workplace representation across any number of demographic categories: race, gender, sexuality, ability, etc.

As with all public and most private institutions, the top-down nature of the nonprofit structure seeks to comply with values like effectiveness, efficiency, and economy, therefore truly limiting the ability to think outside the box and operate in unconventional ways. Similar to public policy development, political discourse, or public opinion within society, hegemony dictates what is right, who is an authority, or how things "should" be done. This normative approach makes any person or organization that falls outside of narrowly prescribed assumptions invisible or irrelevant and unable to be recognized as a legitimate source of information or an adequate source for service delivery. Subsequently, although nonprofits are mission driven, their sustainability within capitalistic (US) and imperialistic (global) contexts is dependent upon a status quo approach toward achieving organizational objectives and ultimately advancing societal values.

Multinational not-for-profit organizations may view their role as a political actor to a greater extent than a provider of goods and services within their respective country based on the need to attract and maintain funding from international partners. As developing countries may not have the same philanthropic infrastructure as the USA, Canada, or Europe, smaller not-for-profits may find themselves at the mercy of donors, thus potentially compromising the overall objectives of the organization. In developing countries, resources are scarce and may only be filtered through existing infrastructure. Resulting in a trickle down allocation of capital, which ultimately may be nonexistent or minimal at best. As it stands, the existing nonprofit structure represents a microcosm of the global marketplace, whereby visibility and recognition afford you the privileges of legitimacy, power, and authority.

## Operation

Nonprofits, like private entities, are guided by their mission and take direction from their respective board of directors. This governing structure dictates the organization's goals, priorities, and programs. To this end, representation is a very important consideration when thinking about the types of activities to pursue and ways to engage with the organization's constituents. As a result, researchers have advocated for more inclusive practices when comprising nonprofit boards in order to be fully considerate of and responsive to constituent needs (Fredette et al. 2016). Despite such recommendations, nonprofit boards have

remained fairly homogenous and slow to respond to calls for active representation by diverse stakeholders. In this case, representation leads to responsiveness and responsiveness may open the door toward coalition building, bargaining, and compromising against competing groups. Therefore, "a diverse stakeholder-inclusive board can better understand its client base, thereby improving the degree to which the board and the organization are able to adapt as new changes evolve" (Fredette et al. 2016, p. 30S).

Whereas Affirmative Action used legal mandates to change the workforce composition in public institutions, the business case for diversity sought to compel organizations to consider the strategic and competitive advantages diversity brings to an organization. In both cases, Affirmative Action and the business case for diversity, its implementation has resulted in a superficial representation of diversity as a quantitative rather than a qualitative measure. In other words, diversity efforts have been used to simplistically count the number of women, people of color, disabled, and LGBTQ persons represented, rather than as an opportunity to empower people to directly affect change within organizations and their communities. The result often leads to tokenism, which relegates organizational members of underrepresented groups to be stereotyped, discounted, or seen to speak for everyone of a marginalized group (Fredette et al. 2016; Weisinger et al. 2016). Consequently, the ends do not justify the means because learning does not occur. Board members, executives, and administrators are not required to develop cultural competence, adjust behaviors, cultivate skills, or increase knowledge about groups, so discrimination is reinforced under the guise of pursing diversity, thus undermining its intention altogether.

Furthermore, the business case for diversity as a consideration to expand representation among a wider stakeholder base is problematic. In this regard, diversity is not pursued because it is the right thing to do or because it is a value sought by the organization, but because it has the potential to produce a better economic end, enhance organizational productivity, or meet a funding criterion. The superficiality for which nonprofit organizations, or any organization for that matter, need to be enticed to pursue diversity demonstrates the white supremacist, patriarchal nature of society's conceptions of worth. Therefore, power is reflected in the privilege of being asked to consider issues of diversity or inclusion, when much of the work being done by an organization is working on behalf of those groups excluded from decision-making in the first place. Within this context, nonprofits appear to be content with feeding a person through required dependence, rather than teaching him or her how to fish or be self-sufficient. This model reinforces organizational sustainability, in that if constituents are empowered, nonprofits will no longer exist.

Subsequently, the structure and operation of nonprofit organizations promote institutional elitism, thus marginalizing smaller, less known nonprofits from accessing scarce resources. For example, the existing funding structure rewards organizations that have name recognition and are able to comply with narrowly defined standards, thus increasing competition and limiting cooperation and collaboration among perspective partners. Smaller or less known organizations may therefore miss out on opportunities or favor based on limited social, political, or economic capital that privileges more established organizations. Therefore, the old adage, *it is not what you know but who you know*, helps to bridge the gap between access and opportunity for nonprofit organizations.

## Outcomes

For smaller or less known nonprofits, raising to the level of legitimacy within the existing status quo environment may prove impossible, especially when trying to secure funding or support programming specific to the social justice needs of a community. For example, nonprofit organizations interested in issues related to restoring voting rights for formerly incarcerated persons or stopping the criminalization of LGBTQ persons of color may have a difficult time being recognized as legitimate organizations, thus limiting their overall visibility, minimizing their voice,

and restricting funding opportunities. As these issues are specific to particular needs within the community, such organizations are intimately aware of the effects public policies, practices, and discourse have on marginalizing returning citizens (people who were formerly incarcerated) or LGBTQ persons of color, respectively. As both of these groups are highly stigmatized within US and global contexts, their needs (as identified through these nonprofit organizations) may very well go unmet based on their status as undesirable, unworthy, or undeserving groups, thus leaving these nonprofit organizations to muddle through delivering quality services to their constituents.

Smaller, issue-specific nonprofits are invaluable to their respective communities. Not only are they rooted in the community, its administrators usually understand challenges from the first-hand experiences of their constituents and, thus, are more likely to be more responsive to their needs. From a grassroots level, solutions to community problems reflect the sentiments of community members, therefore, legitimizing their voice and experience in ways not often seen within larger organizations. As a result, engagement and participation reflect collaborative processes that advance organizational and community level objectives.

Discrimination is embedded in all aspects of life in the USA and globally. As a result, nonprofit organizations, despite their missions or best intentions, foster many of the same attitudes, actions, and behaviors of society at large. Although decades of research have advocated for representation and inclusion of diverse stakeholders, power has remained in the hands of a white authority. This reality dictates who gets what, when, where, and how, ultimately leading to a status quo approach of problem identification, program implementation, and solution development. In other words, the idea that executives or administrators know what is best for impacted populations is a largely sustained and legitimized reality. Consequently, despite the billions of dollars invested by tens of thousands of nonprofit organizations globally, quality of life indicators for many communities are worsening rather than improving.

What does it mean to have nonprofit organizations working in communities for decades, but the needle has not moved significantly on any number of quality of life issues (e.g., housing, healthcare, voting, education, employment)? How do organizations offer goods or provide services to neighborhoods, but do not value the voice, perspective, or experience of residents – as community or board members? Why is there only piecemeal funding for social justice nonprofit organizations that seek to challenge the status quo, empower residents, and change existing power dynamics? If government is incapable of or unwilling to provide services to specific communities, thus relegating service delivery to nonprofits, what does that say about the values of our society? Do such actions undermine the democratic tenets of our society, thus highlighting rhetorical discourse rather than its practical realities?

The steadfast nature for which the status quo is maintained, the power is concentrated, and the lived experiences of the "other" are methodically consigned to a status of second-class citizen demonstrates the intentionality of society's reliance on social hierarchies. These issues are evidenced in institutional practices that block opportunities for demographic representation, minimize access to public institutions, victimize people and communities through policy decisions, and subsequently justify disparities from the lens of individual deficiencies, rather than societal preferences is anti-democratic at best. Change is needed! A new paradigm of engagement that attempts to mitigate discrimination and value difference is required, if the USA specifically will ever live up to its ideals.

## Ways to Address Discrimination

To combat these long-standing practices and assumptions, critical race theory (CRT) began in legal education in the 1980s and since that time many disciplines have adopted its theoretical foundations based on the inclusive nature of the framework. While public and private institutions, political discourse, and public opinion attempt to minimize the influence of race on policy decisions

and the social ills of society, CRT uses a race-conscious framework to examine and analyze how institutional practices produce policy outcomes that disproportionately harm people of color (Zamudio et al. 2011). For example, the homogenous structures of nonprofit organizations perpetuate assumptions about people and place that rarely align with the reality of a given group. Therefore, it is easier to quantify diversity with numbers (a superficial response) rather than share power. The former has the potential to empower individuals and communities, which could lead to substantial changes in the existing power dynamics and society at large.

Public administration specifically and society more generally have positioned discussions about power, privilege, status, and sufficiency within a context that fully denies the creation and maintenance of institutional and structural impediments that continue to advantage whites politically, economically, socially, and culturally over all other groups. Nonprofits, situated right in the middle of these structural forces, are viewed as altruistic in their mission to "help" even while they reproduce many of the marginalizing effects they argue to fight against. This historical amnesia denies the intentionality of racism and discriminatory practices and attempts to minimize the structural effects of policy decisions by blaming the most vulnerable populations for decisions well beyond their control.

Improving the life outcomes for vulnerable groups require scholars, practitioners, administrators, and executives to understand how inequality is reinforced through institutional practices, professional misconceptions, and personal bias in order to identify meaningful solutions to improve the quality of life for all people. Critical race theory is, therefore, useful because it challenges hegemonic conceptions like meritocracy and colorblindness and places race front and center of the discussion. In this capacity, the attitudes, behaviors, and processes that reinforce racial hierarchies are examined, thus limiting the opportunity to keep power concentrated in the hands of a few at the expense of many. A CRT perspective extends beyond race-based social groups and can be applied to the evaluation of all "othered" groups in US society. Ultimately, using a race-conscious approach results in an in-depth examination and appreciation of the lived experiences and perspectives of marginalized groups in the USA and abroad, thus allowing marginalized groups to have their voices and experiences recognized as valid and legitimate sources of knowledge and information.

Nonprofits, in theory, have the greatest opportunity to turn the tide with respect to addressing discrimination. Public bureaucracies are slow to change, if it ever happens. Private entities, even with an economic impetus, may still reproduce disparity through the use of superficial approaches to minimize discrimination. However, innovation could provide new conceptions for ways to engage and collaborate on issues important to communities. Such suggestions are not made without recognizing the myriad of challenges to altering a long-standing structure. Here are a few strategies that may help make nonprofit organizations leaders in mitigating discrimination and moving toward cooperative, collaborative, and empowering engagement with all stakeholders.

Nonprofit organizations and its leaders must be willing to ask questions of their constituents, rather than offering paternalistic assumptions that "they" know what is best for "them." The same deference given to affluent populations with respect to policy development and program planning needs to be given to diverse constituents as well. This is the best way to bridge the trust and communication gap, particularly when community members recognize that organizations are receptive to what they have to say. Critical race theory advocates for the lived experiences of community members to be valued. For organizations to understand that constituency is reflective of everyone, not just those privileged bodies and voices. Traditional practice affords advantages to be funneled toward those stakeholders with social, political, and economic capital; however, it is important to be considerate of the most vulnerable groups as well. If not, administrators and organizations contribute to marginalization.

Organizational members need to be upfront with themselves about their bias. Everyone has bias and that is a fact of life. However, when people are unwilling to acknowledge their bias, personal or professional, he or she is unable to recognize how

that disposition influences interactions and decision-making with affected populations.

Cultural competence is key in the development of meaningful relationships. It should be understood that cultural competency is not a skill that is gained overnight, but rather individuals must commit themselves to a process of lifelong learning. Trainings are needed on a regular, on-going basis to ensure that growth and learning has occurred. It is understood that funding for nonprofit organizations is scarce, so cultural competency training may not be a high priority. However, an investment on the front-end may prove to be invaluable, especially if it helps to foster trust and legitimacy among community stakeholders.

Challenge the status quo by acknowledging and attempting to address the cumulative impacts of the many small decisions made on behalf of your organization each and every day. An organization recognizes that the decisions made (or not made) will have a significant impact on the population served and conceptions of legitimacy. This can be demonstrated by evaluating institutional practices. The top-down bureaucratic structure of public institutions, as modeled by nonprofit organizations, is inherently discriminatory. As a result, it is important to not turn a blind eye to attitudes, behaviors, or processes that produce disparate realities for marginalized groups.

Finally, be transparent with citizens about the organizations' intention and decision-making processes. This may occur through town halls, focus groups, newsletters, or any form of communication. While every decision may not be agreeable to stakeholders, affording them an opportunity to participate in the process will likely be viewed positively. Otherwise, community members feel as if they are an afterthought once all decisions have been made without any of their input or consideration.

## Conclusion

Although nonprofits have conformed to many of the expectations of society regarding structure, function, and operation, change is still possible. Ending discrimination in society requires a personal commitment, which can translate into an organizational shift in behavior. Something needs to be done to change the tide of disparity and inequality in this global context. Nonprofit organizations should volunteer to serve as leaders, thus guiding society's moral compass for better engagement with all groups.

# Nonprofit Organizations and Overhead Costs

Michelle D. Evans
Department of Political Science and Public Service, University of Tennessee at Chattanooga, Chattanooga, TN, USA

## Synonyms

Administrative expenses; Financial reporting; Performance metrics

## Definition

**Overhead costs**: Overhead costs are the administrative and fundraising expenses necessary for NPOs to operate. They are one of the three common performance metrics (along with output and outcome measures) used to assess nonprofit organizations.

## Introduction: Nonprofit Organizations

The study of public administration often focuses on the similarities and differences between the public and private sector and on the interplay between public and private. In recent decades, an increasing amount of attention has been focused on nonprofit organizations. Nonprofit organizations (NPOs) are often referred to as charitable organizations, nongovernmental organizations, public charities, not-for-profits, independent sector, the third sector, 501(c)(3) organizations, tax-exempt organizations, or simply nonprofits.

It is difficult to identify a simple definition of nonprofit organizations. Descriptions in the nonprofit literature generally focus on them as organizations that are:

- Independent of governmental apparatus or for-profit entities
- Formed for the purpose of serving the public good
- Prohibited from private inurement of profits
- Fully or partially exempt from taxation

NPOs have also been described as independent alternatives to the influence or intrusion of government in attempting to solve society's problems. Others describe them as organizations designed to fill the gaps between goods and services provided by the government and those offered for purchase by the private sector businesses. Nonprofit organizations may receive grants and donations from government agencies and private businesses in support of their missions, but they operate as independent, autonomous entities.

The phrase "nonprofit organization" is somewhat of a misnomer, for it focuses on the common misperception that NPOs cannot earn profits. In actuality, nonprofits can, and often do, earn profits. As opposed to private sector businesses, nonprofit organizations are prohibited from what is called "private inurement" (Hopkins 2005, p. 6), meaning that all profits or funds raised must go to serve the mission and purpose of the organization, rather than benefiting owners, board members, or officers of the organization.

The key aspect of NPOs that most laypeople focus attention on is the tax-exempt nature of these entities. NPOs are not supported solely through the donations and income sources listed on their financial reports. They are also subsidized by the broader population through benefit of their tax-exempt status. Nonprofits are often called 501(c)(3) organizations based on their classification as tax-exempt under Section 501(c)(3) of the Internal Revenue Code (Internal Revenue Service 2016). These organizations are exempt from paying most federal and state taxes, and donations to these organizations are considered tax deductible.

The other unique aspect associated with nonprofit organizations is the expectation that they will exhibit three special standards of duty. These are referred to as the duties of care, loyalty, and obedience. The duty of care refers to the responsibility to ensure proper stewardship of organizational finances and management. The duty of loyalty calls on nonprofit board members and staff to put organizational interests ahead of their own interests, especially in situations where conflicts of interest may arise. The duty of loyalty is also linked closely with the restriction on private inurement. The final duty requires the organization, board, and staff to always be obedient, whether it be to the legal system, organizational mission, or organizational bylaws.

These altruistic duties of care, loyalty, and obedience place the nonprofit sector in a unique situation of stewardship to ensure that donations and resources are spent appropriately on behalf of the public interest in support of their mission. Donations to NPOs are given largely based on trust; the trust that a reasonable proportion will be spent honestly, ethically, and effectively to fulfill the organizational mission. What constitutes a reasonable proportion is the central

component of the discussion of overhead costs in the sections that follow.

## Overhead Costs in Nonprofit Organizations

The debate over what constitutes a reasonable proportion in the support of the organizational mission begins with the term overhead costs and related overhead rates. These are also referred to as program spending ratios or administrative/fundraising ratios. In the nonprofit sector, expenses are broken into two main categories. The first category is program expenses, those expenses related directly to programs and initiatives that fulfill the mission of the organization. The second category is referred to as overhead costs, which are administrative costs related to keeping an organization running. Overhead costs commonly include expenses for administrative staff salaries and infrastructure such as computers, office equipment, and office space/buildings. These types of overhead costs are the same in the nonprofit, public, and private sectors. The aspect of overhead costs that are unique to nonprofit organizations is the inclusion of fundraising expenses. Fundraising expenses also generally include salaries and office expenses but also include a broad array of expenses for fundraising efforts such as telemarking, direct mail fundraising, donor development, capital campaigns, and special events. Therefore, overhead rates in relation to NPOs are defined as the percentage of expenses that are spent on the combination of general administrative costs and fundraising expenses. Similarly, overhead rates are defined as the percentage of each dollar that is spent on overhead costs. In other words, overhead costs include staff and infrastructure expenses related to the literal embodiment of keeping a roof overhead.

## Overhead Costs and Rates as Performance Measurement

In recent decades, NPOs have faced an increasingly competitive environment for fundraising and programs. During this time, the need and demand for services has continued to rise while funding sources have struggled to keep pace. This has led NPOs to significantly increase their efforts in regards to performance measurement and program evaluation. Funders are increasingly adding accountability and impact requirements as a prerequisite to receiving grants and donations. Donors, and even service recipients, are also becoming selective and seeking more information on NPO performance and how their donations are being utilized. Donors want to be assured that their contributions are directed at fulfilling the organizational mission efficiently. One common fear is that donations may be used to support bloated salaries, ineffective or vanity programs, or lavish fundraising activities that yield low returns on investment (Snibbe 2006). Concerns about efficiency and effectiveness are not restricted just to clients, donors, and supporters within the nonprofit field. The public is entitled to be concerned about the effectiveness of nonprofits given that they are, in effect, supporting them through tax-exemption policies.

NPOs have traditionally been much more loosely regulated than the for-profit world, largely due to their efforts to serve the public good. Recent financial and fraud controversies, criminal activity, and alleged mismanagement by NPO staff and boards (Fremont-Smith and Kosaras 2003) have increased calls for government regulation. Whether in an effort to comply with current regulation or in an attempt to limit future regulations, the nonprofit sector has increasingly moved towards self-regulation and the use of performance metrics to demonstrate organizational integrity, efficiency, and effectiveness and satisfy the concerns of regulators, donors/funders, and client expectations.

The measurement of performance, effectiveness, and/or efficiency is a far more complicated process for NPOs than it is for for-profit organizations. Private businesses can utilize market-based and bottom-line profit goals and accounting methods to measure their success and efficiency. However, NPOs face an inherently different structural and organizational reality whereby they must balance fiscal stability with fulfillment of the organizational mission and diverse stakeholder needs.

Market-based and bottom-line standards are inappropriate and inadequate measurement standards due to the very nature of the nonprofit field. NPOs are predominately focused on difficult-to-measure public goods such as the arts, education, and environment. NPOs may also be formed to address "wicked problems," which are complicated social issues such as poverty, crime, and health issues. The root cause and solutions to these types of problems are difficult to define, often intertwined with a multitude of other complicated issues and, therefore, difficult to measure in terms of organizational impact (Rittel and Webber 1973).

Despite these difficulties, the ability of NPOs to demonstrate that they are fulfilling their organizational mission is essential in meeting accountability dictates by the government, donors, and the general public. Within the nonprofit community there is considerable debate about the best way to measure, rate, and evaluate organizations, especially in ways that can be easily understood and disseminated. NPOs are constantly looking for ways to demonstrate their organizational efficiency and effectiveness. In previous decades, the impact and results of NPOs were largely demonstrated through anecdotal evidence and testimonials (Glasrud 2001). These days NPOs are moving to more structured empirical evaluation and assessment methods.

The nonprofit field is largely divided between three standard types of performance metrics: output measures, outcome measures, and overhead costs/overhead rates (Mitchell 2013). Output measures are the quantitative assessment of the activity generated from program or monetary inputs (such as the number of clients served). Outcome measures are used to determine the impact or change that is generated from program activities. Much like the nonprofit field in general, however, outcome measures are more difficult to assess. This difficulty can be attributed to an array of factors including organizational capacity, difficulties in determining the appropriate measurement outcomes, diverse priorities among organizational stakeholders, and the length of time to realize community impact. Additionally, NPOs face an inevitable quandary in deciding whether, or how, they should focus their program efforts and assessments on long-term impacts when they are often held accountable for or rewarded based on short-term impacts.

Overhead rates, once the most common performance metric, have become an increasingly debatable and divisive performance metric within the nonprofit community. The arguments for and against overhead costs/rates are addressed in the next sections. Despite the ongoing debate, the general consensus has been that overhead rates for nonprofit organizations should run no more than 35% of total expenses (Hager et al. 2004). This industry standard, or benchmark, can then be used to compare NPOs as one method for comparing the efficiency of these organizations. Until recently, NPOs with overhead rates that exceeded two thirds of their annual budget expenses received unsatisfactory ratings (i.e., 0 out of 5 stars) by leading charity watchdog groups.

## Arguments in Support of Overhead Rates

Those that support the use of overhead rates argue that donors need performance indicators that are easily obtained and understandable. Overhead rates in many ways fulfill that directive. Donors can easily understand overhead rates when they are explained as X cents of every donated dollar that is spent on administrative and fundraising expenses. NPOs more commonly tout their overhead rates indirectly in fundraising appeals by stating the percentage of donations that go to program costs (such as "80 cents of every donated dollar goes to help the mission").

The only data that donors need to determine overhead rates are the annual NPO budget and program expenses, or costs, from which overhead rates are determined. While this data is generally available from NPO annual reports, the easiest method of obtaining the data is from the IRS Form 990, which most 501(c)(3) tax-exempt NPOs are required to submit each year. The IRS 990 form is the most consistently available and comprehensive financial report in the nonprofit sector and is easily viewed or downloaded from websites for charity watchdog organizations such

as Charity Navigator, GuideStar, and BBB Wise Giving Alliance. Easy access to the Form 990 data has also allowed researchers and watchdog organizations to compile large datasets which are also available for analysis and study of the nonprofit sector's finances and administrative/fundraising accountability and efficiency.

Overhead rates are also touted as an easy tool for donors to use to compare one organization to another. Donors who value overhead rates as a performance metric can easily pull up the Form 990s or summaries of NPO financial data from the charity watchdog websites for comparison and then choose the charity with the lowest overhead rate. High overhead rates could be warning signs of financial mismanagement or fraud on the part of organizations, or they could signal misplaced organizational objectives.

Overhead rates and traditional accounting practices can serve as consistent and reliable measures for nonprofits. While other performance indicators have been promoted as more relevant in determining the organizational impact, financial measures such as overhead rates have the benefit that they can be verified through standard auditing practices. Another factor that supports the use of overhead rates and financial accounting metrics to assess NPO performance is the ability of donors and funders to evaluate the organization based on short-term, limited timeframes. Potential funders are able to make decisions on where to give their donations based on fairly current financial conditions of each NPO, rather than having to decipher the problems and issues related to determining mission outcomes that may be overlapping and interwoven with outside organizations or situations beyond the control of a given NPO.

Overhead rates are also viewed as an attractive method of performance measurement given that there is no significant additional cost or effort necessary in determining overhead rates since the relevant financial data is already required for annual Form 990 submissions. In addition, similar to the for-profit sector, research has shown that continued oversight and governance efforts positively affect the quality of financial data reported by NPOs (Yetman and Yetman 2012). In other words, NPOs know that they must be transparent through the annual provision and inspection of their financial data and overhead rates, thus they self-regulate and behave more honestly and professionally. NPOs may also benefit from financial disclosure requirements through an increase in public trust and accountability in the competitive fundraising environment in which they operate.

## Arguments Against Overhead Rates

Recently, there has been a growing faction in the nonprofit field advocating against the use of overhead rates. They argue that low overhead rates are a poor indicator of NPO efficiency or effectiveness and may actually serve as a sign of fiscal distress in organizations. This has been described as "the overhead myth" by leaders of Charity Navigator, GuideStar, and BBB Wise Giving Alliance, the three main charity watchdog organizations (Berger et al. 2013). The watchdog organizations have begun working together to try and educate donors about the risk of reliance on overhead rates when evaluating nonprofits. They argue that the overwhelming focus organizations place on maintaining low overhead stifles the need for creativity and innovation in the nonprofit field. Efforts to keep overhead costs as low as possible can restrict management capacity and hinder an organization's ability to properly accomplish their mission. They further argue that this reduces an organization's ability to attract the best employees or properly invest resources necessary to grow organizational capacity and meet future needs. One recent study on charity performance and reputation found that organizations with low overhead rates were often seen as lower-performing and were, therefore, viewed less favorably by the public (Young-Powell 2013). This perception of NPOs with low overhead rates is significant in terms of the possible long-term impact on fundraising efforts and public support.

Perhaps one of the most consistent complaints against overhead rates is that accounting decisions on what constitutes an overhead expense verses a program expense are subjective and frequently

vary from organization to organization. The lack of governmental regulation or oversight of nonprofit financial reporting, coupled with the leniency in penalties for financial wrongdoing and lack of clear and specific reporting instructions, adds to the problem of misallocated expenses and inaccurate overhead cost calculations and reporting (Williams 2009). Organizations often face extreme pressure to find ways to avoid spending and skimp on overhead expenses and otherwise risk receiving low ratings from watchdog groups, funding agencies, and donors (Gregory and Howard 2009).

One common practice is to allocate some, or all, of administrative/fundraising salaries and expenses under program costs. NPOs justify this by explaining that many administrative and fundraising expenses also serve to educate the public about the mission and purpose of the organization, and therefore are justifiable as being partially or fully allotted as program expenses. This practice results in many NPOs reporting minimal or nonexistent overhead costs. The dominant perception that donors favor nonprofits with lower overhead cost indirectly promotes these accounting and reporting practices. In addition, donors' perceptions of what should constitute programmatic expenses as opposed to overhead costs may differ considerably from NPOs' perceptions.

Arguments against the use of overhead costs as a measure of organizational performance point out that the short-term overhead rates can be misleading. Organizations that invest in infrastructure, such as computer equipment and software, may show high overhead rates in the short-term, but the cost-savings and efficiency of that type of investment may benefit the organization with long-term reductions in overhead rates and increases in efficiency and impact on the organizational mission. This also extends to fundraising projects where there may be short-term increases in overhead costs related to donor cultivation or development of fundraising campaigns that may have delayed, but long-term, increases in fundraising efforts.

Overhead rates may also give a misleading impression of organizational efficiency based on the size and age of the NPO. Larger and more established NPOs may have more success in maintaining low overhead rates based on efficiency of scale and experience. Smaller and newer NPOs often have higher overhead rates in the beginning as they work to establish themselves and grow. These NPOs face stiff competition against larger and older competitors that benefit from established administration and funding channels. This dilemma not only impacts the performance of smaller and newer NPOs but may inhibit their potential for long-term growth that requires investing in infrastructure and capacity-building initiatives (Wing 2004). The competitive advantage that older and larger NPOs have in maintaining low overhead rates also serves to stifle creativity and cutting-edge or risky innovations that newer or smaller NPOs may otherwise be willing to attempt. Perhaps in recognition of these issues, Charity Navigator (2016) recently changed their assessment process to downplay the importance of overhead rates in evaluating nonprofits.

## Conclusion

Overhead rates are appealing as a decision-making tool for donors because they are readily available, understandable, and easily used as a comparison method between organizations. Despite this, watchdog organizations and researchers are increasingly focusing on alternative performance metrics, such as output or outcome measures, as preferred performance metrics.

Evaluating NPOs on the basis of overhead costs and ratios has led to significant debate in the nonprofit sector. NPOs with low overhead costs may be viewed as efficient and well-run organizations, while at the same time may realize negligible positive outcomes for the public good. NPOs with high overhead costs may be viewed as inefficient and wasteful, yet these organizations may also have significant positive outcomes for the public good. Attempts to find a balance between these approaches have led to suggested benchmarks for overhead rates and the use of a multipronged performance metric approach.

Using overhead rates as the sole indicator of nonprofit efficiency gives only one side of the

story – one that may be outdated almost as soon as it is available – and/or a false indicator due to missing or fraudulent information and accounting practices. This has lead nonprofit leaders and charity watchdog organizations to deemphasize overhead rates as a performance measure. Recent opinion on overhead rates is that they provide valuable but limited information and may be best utilized in combination with output and outcome performance measurements, rather than as a sole determination of NPO performance.

## Definition

Social policy: Policies that encourage human well-being.

## Introduction

This entry is designed to promote an understanding of America's nonprofit sector's impact on

social policy. From the local food pantry, the neighborhood community health center, to the American Red Cross, nonprofits are touching millions of lives every day. Alongside the government, nonprofits assume an enormous responsibility for the well-being of citizens in the United States (USA). Through contracts, governments are able to reach communities, serve their constituents, and nonprofits achieve their missions. This article explores nonprofits impact on social policy and the government-nonprofit relationship in addressing social problems in the USA.

## Overview of Nonprofits

Nonprofits are a significant element of the United States financial system. The Internal Revenue Service (IRS) reported tax returns for 257,802 nonprofits with assets of $4,133,897,436 (IRS 2015). Since many nonprofits are not incorporated, it is therefore difficult to estimate the number of nonprofit organizations in the USA. In addition, religious organizations and other smaller nonprofits are excluded from the IRS report. Nonprofits are not necessarily tax-exempt; however, they qualify for a tax-exempt classification. Some organizations choose not to file for tax-exempt status. There is a general misconception that nonprofits are not profit oriented, whereas, in reality, they are encouraged to incur profits. The distinction between for-profit and nonprofit organizations is how those profits are dispersed. While for-profit organizations are allowed to distribute their profits among controlling directors and officers, nonprofits profits must remain with the entity. In the USA, nonprofits employed 10.2% of the workforce and accounted for 6.6% of the gross domestic product (Johns Hopkins University 2013).

Nonprofits are categorized into several groups. The first group is classified as public charitable organizations under 501(c) (3) which are public serving organizations including hospitals, community health centers, schools, religious congregations, museums, and other human and social service organizations. In addition, under section 501(c) (3) are private foundations of which most have only one donor. The second nonprofit is 501(c) (4) social welfare organizations and civic leagues consisting of large organizations, such as the National Association for the Advancement of Colored People (NAACP), the National Rifle Association (NRA), and the Sierra Club. The third group, 501(c), (5) includes labor, agriculture, and horticultural organizations. The forth group, 501(c), (6) includes business leagues, chambers of commerce, and real estate boards. The fifth group, 501(c), (7) is mostly social and recreational clubs. The sixth group, 501(c), (8) includes fraternal beneficiary societies and associations, and the final group 501(c) (9) includes voluntary employee beneficiary associations (IRS). The average charitable contribution in the USA in 1913 was $195,337 (Urban Institute 2013). This article will focus on the first group of public charitable organizations.

Within a few mile radius of Jackson State University's (JSU) downtown campus, there are a host of nonprofits providing a wide range of social services. Within a few blocks on West Capital are the Voice of Calvary Ministries, Koinonia Coffee House, and many local churches. A little further south is Stewpot, Project Rise, Old Stranger's House, and the Medical Mall with several medical facilities including Jackson Hinds Community Health Center and JSU's School of Public Health and more churches. Just east of the JSU downtown campus is the Russell C. Davis Planetarium, the International Museum of Muslim Cultures, The New Mississippi Museum of Art, The Catholic Diocese of Jackson, the Eudora Welty Library, the Mississippi Baptist Convention, and more larger churches. Going further south on State Street about a mile is Baptist Hospital and about a mile further is the University of Mississippi Medical Center.

As evidenced by the variety of organizations during the tour around Jackson JSU's downtown campus, nonprofits are very diverse in the scope of services provided and scale. The range includes small grassroots organizations with none or few assets like Project Rise to large complex multi-million dollar organizations that include hospitals, religious organizations, and universities. Services

offered range from feeding programs (soup kitchens), healthcare, education, counseling, housing and housing assistance, reentry, etc.

Revenue sources are as diverse as the services offered by these organizations. Those revenue sources include fees generated for services provided and donations. However, many of their revenues are government funds. In 2013, government grants to nonprofits totaled $163,360,958 (IRS 2015). The relationship between government and nonprofits enables the government to serve their constituents and nonprofits to achieve their missions.

## History of Nonprofits

For a long time, nonprofits have been perceived as catalysts for the public social needs. In the 1970s, nonprofit organizations became a unified "sector." Although, prior to the 1970s, many charitable, educational, and religious organizations were in existence, over 90 percent of current nonprofit organizations were created since the 1950s (Renz 2010).

Traditionally secular nonprofit organizations had been associated with liberalism. However, conservatives have begun to appreciate the benefit of nonprofit organizations in achieving their own social policy goals. Increasingly policy makers are looking to nonprofits as solutions to societal problems. The 1980s and 1090s generated emphasis on conservative social policy in response to the increasingly identified social problems. Until the 1970s, healthcare organizations had been overwhelmingly nonprofits. However, in response to the necessity to control the rising cost of the provision of healthcare, some healthcare organizations were forced to become more efficient in way they function. Consequently, many became for-profit, while others formed alliances with for-profits to improve their economic position.

## Nonprofits Impact on Social Policy

Government has for many years depended on nonprofits to deliver vital goods and services to communities to promote social well-being. The majority of nonprofit organizations are human services organizations. These organizations provide goods and services that enhance the quality of life for individuals, families, and communities.

Fundamental to an improved state of well-being are food, housing, education, healthcare, a job, money, and security, to mention a few. Accordingly, there are many ways these social needs can be addressed to enhance human well-being. Ways in which these social needs are delivered are by the government, churches, schools, hospitals, social service organizations, community members, and families. This entry will focus on nonprofits' impact on social policy.

Nonprofit organizations provide goods and services that enhance human well-being in effective and innovative ways. Nonprofit organizations and government agencies have been in the forefront of service delivery. Tucked within their respective community, nonprofit organizations offer quick and culturally appropriate manner. Nonprofits promote democracy and serve the critical interest of communities. In fact, the nonprofit sector is often referred to as the "social impact sector." Oftentimes they are the first respondents to crisis and disasters.

Hurricane Katrina happened 9 years ago today. A typical example of the importance of and validity of nonprofits was their level of activism and involvement. Nonprofits were onsite providing services almost immediately. On this and many other occasions, nonprofits have been on site assisting individuals and communities prior to government organizations intervention. The outpouring of support from nonprofits relative to Michigan as a result of the water crisis is another vivid example of the relevancy and importance of the nonprofit sector. Nonprofit human service organizations and churches from all over the country responded with 18 wheeler truckloads of bottled water.

Here I will highlight some nonprofit organizations serving the Jackson Metropolitan area.

### Voice of Calvary Ministries

Mission "Voice of Calvary Ministries serves as a resource in Christian community development by providing holistic programs which build strong

N

> individuals, families, churches and communities in order to enable them to reach their full potential in Christ physically, spiritually, economically and socially."

Voice of Calvary Ministries serves families with low to moderate incomes with a goal of breaking the cycle of poverty and to rebuild inner city communities. Services include (1) case management and referral services for healthcare, daily living activities, financial planning, transportation, income support, and legal assistance; (2) temporary financial assistance for rental assistance, utility fees and deposits, security deposits, moving cost, emergency supplies, childcare, and transportation; (3) job placement; (4) homebuyer education; (5) mortgage delinquency counseling; (6) rental counseling; (7) credit counseling; (8) financial literacy; and (9) healthy lifestyle education.

Voice of Calvary Ministries also provides special services designed for veterans. They recently began to provide housing to approximately 40 veterans and have started a new prison reentry program.

### Stewpot Community Services

> Committed to Community Statement: "Stewpot Community Services provides thousands of men, women and children with hot meals, groceries, clothing, shelter, childcare, mentoring and other programs to nurture them and help them get back on their feet. We believe the sacred is encountered in the common events in like sharing a meal. We are all fed, spiritually and physically, by our fellowship with each other."

Stewpot Community Services include the following:

1. The Stewpot After-School Program provides a safe haven where children and teens are provided educational assistance.
2. Billy Brumfield Shelter house up to 60 homeless men.
3. The Bratton Street Project is a housing rehabilitation project that has renovated over 15 homes through a collaboration with Habitat for Humanity.
4. Stewpot host interfaith worship services 6 days a week. Worship services are encouraged but not required for participants to receive services from the organization.
5. The Clothing Closet is stocked with quality donated free clothing and serves about 100 people a month; through the Community Kitchen, more than 120 individuals are fed daily, and 50 plus meals are delivered to persons who are shut-in in the area.
6. Community Clinics provide Legal services through a collaboration with The Mississippi Volunteer Lawyers Project, primary healthcare through a collaboration with St. Dominic's Health Services, and individual and group counseling by trained family counselors.
7. The Community Kitchen operates 365 days of the year.
8. Stewpot operates two community labs that are open to the public.
9. The Food Pantry is a volunteer-operated free mini-grocery store that provides a 4-day supply of feed to screened applicants.
10. Through the Meals on Wheels program, volunteers deliver meals to more than 50 elder persons in the community.
11. The Opportunity Center is the city's only day shelter and provides a safe and clean day program for men and women.
12. Since 1991 the Stewpot Recreational Summer Camp has served more than 200 children each summer.
13. Virginia's Playhouse offers morning activities for the elderly and mentally disabled. The participants engage in art therapy, creative writing classes, bingo games, and field trips.
14. Women's Services provides three housing alternatives specifically for women. Sims House is a transitional shelter for women and children and provides a 90-day stay and serves about 60 individuals annually. Matt's House is an emergency shelter and serves about 300 individuals annually. Flowers House is a small emergency shelter housing homeless women and children and has the capacity to serve six families at a time.

### Cade Chapel Missionary Baptist Church

> Mission: "We glorify God by engaging the world with the Gospel of Jesus Christ and providing for each member an intentional path of Christian maturity, church unity and missionary service."

In 1880, a group of Christian men established the first church, a "Brush Arbor" in the Asylum Hill community. The property for the church was donated by Isham Cade after whom the church is named. From 1904 to 1928, Cade Chapel Missionary Baptist Church was not only a place of worship but became the community center. Again in the late 1950s and 1960s, Cade Chapel became the meeting place for the community. It was the official meeting place for the National Association for the Advancement of Colored People (NAACP).

Like many religious organizations, Cade Chapel continues to be a significant pillar in the community. Today Cade Chapel's Center for Family Life, a 1.2 million dollar facility built in 1995, offers the community several social service programs. Some of the services offered are (1) a day care center for about 7 0 children daily, (2) after-school tutoring, (3) Science Technology Engineering and Mathematics Project (STEM Project), (4) a week-long children's summer camp, and (5) Kids Blast, a kid and family fun activity project, and drama for the youth and families in the community.

In addition, the church operates a senior housing project, Cade Court. Cade Court is an affordable independent living apartment complex that houses 90 seniors. The seniors are offered assistance with daily living activities and outreach services. The church has collaborated with a local CHC, Jackson Hinds Comprehensive Health Center, to provide onsite weekly primary care services to the seniors at Cade Court. This is a long-standing collaborative relationship that began when the health center's state funds were cut in 1973. Cade Chapel responded to their crisis by housing the entire health center program free of charge.

There are several missions undertaken by the church to provide outreach support to the community. The Mission Brotherhood provides painting and carpentry services to local shelters, builds ramps for seniors and persons with disabilities, and replaces roofs on houses within the community.

For the purpose of this entry, I interviewed Pastor Reginald Buckley of Cade Capel. When asked his ideas of nonprofits responsibility to social policy, he shared the following: "Jesus gives the church a great model for the church to follow as it relates to our social witness. I believe that a full and authentic expression of faith requires the church to be concerned about human suffering – both earthly and eternal. While the church must minister life to the souls of man, a relevant faith demands that we minister to the material and social needs of humanity. As such, at Cade we strive for a balanced approach in ministry that consists of (1) charity/benevolence to meet immediate needs, (2) advocacy to empower the vulnerable and speak out on the systemic issues that create such needs, and (3) spirituality to develop one's faith in God through Jesus Christ." It is not surprising that Cade Chapel was one of the first Mississippi organizations to respond to the Michigan water crisis and is currently responding to the Crosby, Mississippi community's flood disaster.

## Community Health Centers

Access to quality primary healthcare continues to be a major problem for persons living in poverty and in underserviced areas. However, Community Health Centers (CHCs) across the nation are leading the charge to serve this population. Community Health Centers offer comprehensive primary and behavioral healthcare services for over 25 million people in rural and urban communities in the United States. These health centers provide services regardless of an individual's ability to pay. They charge a nominal fee for self-pay patients using a sliding fee scale that adjusts to patient's income.

Services provided include (1) comprehensive primary healthcare to men, women, and children, (2) HIV/AIDS services, (3) oral health services, (4) pharmacy services using the 340b drug discount pricing program, (5) State Children's Health Insurance Program (SCHIP), (6) behavioral health services that include mental health counseling and diagnostic services that include radiology, x-ray, and electrocardiograms.

One of the unique aspects of CHCs is that they are governed by board members who live or work in the community where the health center is

located. Additionally, more than half of all board members must be users of the health center where they serve. Community health centers are located in every state. In 2014, the National Association of Community Health Centers reported that there were 2278 CHCs with 8770 sites who served 22,873,243 patients with 90,379,441 encounters. These CHCs employed 170,331.27 FTEs. Of the patients served by these health centers, 28% were uninsured, 47% were on Medicaid, and 9% had Medicare. All health centers are encouraged to collaborate with other organizations within the communities they serve to avoid duplication of services. Appointments are available to patients; however, health centers also provide walk-in services. Through cooperative agreements with local hospitals, CHCs provide 24-hour medical coverage.

There are 21 CHCs in Mississippi with 180 sites. One of these health centers, Jackson Hinds Comprehensive Health Center, is located just a short distance from Jackson Mississippi's downtown area.

### Jackson-Hinds Comprehensive Health Center

> Mission: "To provide quality comprehensive primary and preventive health care and social services to the communities we serve. We are committed to serving the uninsured and underinsured."

Jackson-Hinds Comprehensive Health Center provides primary healthcare and behavioral health services in 17 locations. Locations include several stand-alone clinics. Other locations include college campuses, apartment complexes, and a shopping mall.

The services provided include (1) adult medicine, (2) pediatric care, (3) obstetrics and gynecology, (4) dentistry, (5) optometry, (6) pharmacy, (7) social services, (8) behavioral health, (9) laboratory services, (10) radiology/x-ray, (11) WIC (Women, Infant, and Children Nutrition); (12) Healthy Start; and (13) transportation services.

### Young Men's Christian Association

Young Men's Christian Association's (YMCA) United State Tagline: "For Youth Development. For Healthy Living. For Social Responsibility."

The YMCA is a worldwide nonprofit organization based in Geneva, Switzerland. The YMCA was founded in 1844 utilizing the concept of Christian principles to develop a healthy "body, mind, and sprit."

The USA's first YMCA opened in 1851 in Boston Massachusetts. Today the USA's national office is located in Chicago, Illinois, with 2700 local chapters across the country. Services offered at these locations include (1) children and youth; (2) health, fitness, and recreation; (3) childcare; (4) day and resident camping; (5) employment training; (6) community outreach and newcomer services; (7) international development and education; and (8) leadership development and recognition. Although there is a charge to use the services of YMCA, financial assistance is available to all.

Located approximately two miles from the state capital is the Downtown Family YMCA, one of four of Jackson Metropolitan area YMCAs. This location has all of the amenities of most wellness centers including a newly remodeled aerobics studio, a weight and cardio room, a fitness room, a yoga and pilates studio, and indoor and outdoor walking and running tracks. The YMCA is host to the Hardin Aquatics Center with swimming facilities available to its members.

The aforementioned nonprofits are only a few of the thousands that respond to the daily social needs of our society. In 2010, when President Obama signed the Affordable Care Act (ACA) into law to increase access to quality and affordable healthcare, nonprofit human service and healthcare organizations were at the forefront of implementing the program. Through grants with the government, nonprofits are responsible for much of the marketing and outreach, registration, and direct service provision of the ACA program.

## Conclusion

Nonprofits exemplify the best of our nation. They assist millions of individuals and families every day. They are oftentimes first responders during the worst of disasters, promote democracy, and

protect our tax dollars. They have been a critical factor in responding to the social ills in the USA. For many decades, they have not only been advocates for improved social policies but also have been in the forefront of improving social conditions. The services and goods provided to society by nonprofits are vital to the health of our nation ranging from the provision of a meal to quality affordable housing. Government has realized the positive impact nonprofits have on social policy and as a result has turned to them to deliver goods and services within their localities. Nonprofits provide quality, efficient, and cost-effective services. In 1912, nonprofits with government contracts in the USA were at 137,392 contracts totaling $736 million dollars. Of the 51 states, California had the highest number with 5172 contracts, South Carolina ranked 25 with 770 contracts, Nevada ranked last with 194 contracts, and Mississippi ranked 49 with 202 contracts. Grants and contracts were awarded to several types of organizations. The majority of government contracts/grants were to human service organizations at 53%. Table 1 shows the distribution of the types of organizations receiving government grants and contracts in the USA.

As reflected in the table above, human service organizations enter into contracts with government agencies to provide services more than any other type of organization. The practice of government turning to nonprofits to provide services that they are not able to provide directly is a longstanding practice. This has been an effective practice because nonprofits are on the forefront of societal personal and community needs that require government resources.

**Nonprofit Organizations and Social Policy, Table 1** Types of organizations with government grants and contracts

| Types of organizations with grants/contracts | |
|---|---|
| Arts culture and humanities | 13% |
| Education | 7% |
| Environment and animals | 4% |
| Health | 12% |
| Human services | 53% |
| Other | 11% |

## Introduction

For any nonprofit organization to advance its mission requires engagement with those who have a stake in its work, including program participants, donors, community members, and others. The rise of the Internet and social media have provided mechanisms to facilitate that engagement. At their core, the Internet and social media are communication tools that support information sharing and interaction with the public that have enabled nonprofit organizations to reform and improve aspects of management that involve stakeholder engagement. The management functions most affected by these developments are marketing,

fundraising, and advocacy. The ways in which nonprofit organizations use the Internet and social media continues to evolve, in recognition of the diverse capacities they provide for enhancing nonprofit management and leadership. This chapter reviews the evolution of Internet and social media use by nonprofit organizations. It also considers several theoretical frameworks that account for how they develop, implement, and use Internet and social media strategies. The chapter concludes with a brief discussion of the current status of Internet and social media use in the nonprofit sector.

In the early years of the Internet and prior to the development of widely-adopted social media tools, nonprofit organizations developed websites based on Web 1.0, utilizing its initial, limited functionality for information provision and one-way communication. Since the advent of social media and the dynamism and interactivity associated with Web 2.0, many nonprofit organizations have developed websites and social media capacities that offer more and deeper opportunities for stakeholder engagement; however, Internet presence and social media use has varied among nonprofit organizations, based on their organizational purpose and other important characteristics. Initially, many researchers and practitioners argued that the communication capacities of the Internet and social media would lead to an increase in dialogue between the leaders of nonprofit organizations and their stakeholders. Yet, recent studies suggest that stakeholder engagement is a more appropriate lens than dialogue through which to understand how nonprofit organizations use the Internet and social media. Nonprofit organizations have not yet fully realized the potential that social media and the Internet present.

## Web 1.0

The first 10 years of the Internet is often referred to as *Web 1.0*. During this time period, nonprofit organizations focused on developing websites designed to convey basic information to educate the public about their work. The websites created at that time were static; users accessed them to acquire information. The user experience was a passive one and did not involve direct engagement with the providers of content. In other words, Internet users read information on websites but had limited or no opportunity to engage with it or provide feedback. Research conducted at this time indicated substantial variation in the percentage of American nonprofit organizations with websites, ranging from 30% in one study (Powell et al. 2016) to 77% in another (Hackler and Saxton 2007). These early websites allowed organizations to provide stakeholders with a wide variety of information, such as mission statements, descriptions of programs and services, board and staff lists, annual reports and other publications. Many recognized the potential the Internet presented for nonprofit organizations, in areas such as online fundraising and marketing of the organization; however, the lack of interactivity on websites limited organizations' ability to take advantage of that potential.

## Web 2.0 and Social Media

The second phase of Internet development, Web 2.0 and the rise of social media, created greater opportunities for nonprofit organizations and their stakeholders to engage with each other, by enabling them to develop and react to different forms of material on the Internet. This newly developed capacity is what distinguished Web 2.0 from its predecessor. Specifically, Web 2.0 refers to the second generation of the Internet, specifically, the capacity for "the creation and exchange of User Generated Content" (Kaplan and Haenlein 2010, p. 61). This definition includes social media, which can be described more narrowly as web-based applications that use Web 2.0's capacities for creating and sharing material. Web 2.0 offers all people with Internet access, the opportunity to create content and share it with others easily, at little or no cost. In this way, Web 2.0 embodies the Internet's democratizing effect.

Nonprofit sector practitioners and researchers argued that Web 2.0's enhanced Internet capacities would make it possible for nonprofit

organizations to engage more directly with stakeholders and that they could use that engagement as an opportunity to participate in regular dialogue with them for organizational development purposes. For example, with Facebook nonprofit organizations can share information about activities and stakeholders can comment about it. Similarly, staff at nonprofit organizations managing Twitter accounts can engage with constituents by retweeting or replying to their tweets. Some evidence suggests that organizations capitalized on this opportunity. For example, the interactivity offered by Web 2.0 applications has made it possible for organizations' websites to include features such as online fundraising, blogs with commenting capacity, and other tools that allow stakeholders to provide direct feedback to the organization. One indicator of nonprofit organization success in the Web 2.0 era is the growth in online giving. Network for Good's Online Giving Index indicates relatively modest levels of online giving until 2006 (and the advent of Web 2.0), after which annual online giving increased consistently, from approximately $100 million that year to over $1.4 billion in 2015 (http://www.networkforgood.com/digitalgivingindex/).

In addition to websites, some organizations created YouTube channels as a way to engage with stakeholders. While not widely used, particularly among moderate-sized and smaller organizations, YouTube channels also provide opportunities for stakeholders to share and comment on videos. In terms of social media, Facebook emerged first as a tool for nonprofit organizations, soon followed by Twitter. These two have remained the most regularly used social media tools; other applications, such as Instagram and Snapchat, are popular with the general public, but nonprofit organizations have not yet widely adopted them.

Because nonprofit organizations are mission-driven, and in many cases act as agents of their key stakeholders, the interactive potential of Web 2.0 was particularly important because it provided tools to engage stakeholders directly. Facebook, for example, enables "fans" of organizations to share, comment on posts, and "tag" organizations; Twitter allows users to tweet at organizations and reply to or retweet messages. Comments on blogs and sharing video content on organizations' websites or YouTube channels also reflect Web 2.0's engagement potential. In the years immediately following the development of Web 2.0, many researchers and practitioners emphasized dialogue as the likely consequence of its content creation and exchange capacities. Practitioners have written several books designed to help nonprofit organization leaders to leverage this potential. For example, Kanter and Fine's *The Networked Nonprofit* (2010) emphasizes the way in which social media makes it possible for nonprofit organizations to build relationships with stakeholders, respond to public input, and use those relationships to fundraise. In addition, Kapin and Ward's *Social Change Anytime Everywhere* (2013) made the case that social media's interactive features also facilitated community building and advocacy.

## Internet Presence and Social Media Adoption

Studies of nonprofit organizations, the Internet, and social media reveal several patterns about the technology adoption choices they make. Organization characteristics and mission-specific needs may affect these choices. Table 1 provides a list of research papers that have incorporated surveys of Internet and social media use. The studies vary by date, form of Internet presence, and nonprofit setting. Although many may consider websites as necessary for any organization, not all nonprofit organizations have made the choice to have them. A 2014 sample of San Francisco Bay Area nonprofits found that 12% (mostly small organizations) did not have websites (Powell et al. 2016); in addition, only 46% of Church of Christ congregations had websites in 2015 (McMahon et al. 2015) – though many treat churches as different from other forms of nonprofit organization.

The data also show wide variability in social media adoption rates across populations of nonprofit organizations. These variations align with important characteristics about organizations and

social media. For example, community foundations use Facebook at a much higher rate than independent foundations (Maxwell and Carboni 2016). This result is consistent with the argument that nonprofit organizations primarily use social media for stakeholder engagement; community foundations rely on external constituents for financial resources, while private foundations do not. Further, Twitter had higher adoption rates in organizations that primarily engage in advocacy, 80% of one sample (Guo and Saxton 2013) and 94% of a later sample (Saxton et al. 2015). These adoption rates support the idea that nonprofit sector professionals see Twitter as an advocacy tool. Finally, the largest organizations which have the greatest capacity for technological innovation have the highest social media adoption rates. Social media use has also grown the most among these organizations. Facebook adoption among this population increased from 65% in 2009 (Nah and Saxton 2013) to nearly universal adoption (97%) in 2013 (Saxton and Waters 2014). In studies that reported multiple forms of Internet presence, Facebook was consistently the most popular, when compared to other forms of Internet use and social media, such as Twitter, YouTube, or blogs.

A study by the scholars Nah and Saxton (2013) further accounts for the way in which organizational characteristics shape social media adoption. They found that among the largest American nonprofit organizations, those that relied most on revenue from individual donors or program service fees were most likely to have adopted Facebook. These findings indicate that nonprofit organizations view social media as mechanisms

for supporting fundraising and marketing efforts. Facebook is more likely to be adopted in those organizations in which fundraising and marketing are most essential. On Facebook, nonprofit organizations can communicate with stakeholders in ways designed to encourage participation in the organization's activities and to make donations. Facebook can also convey important organizational information, which is consistent with nonprofit use of social media for marketing purposes.

Analyzing nonprofit organizations' demographics and engagement needs provides one way to understand the considerations that determine Internet and social media adoption; however, it is also possible to understand this phenomenon as one shaped by the nature of the staff in individual organizations. Mergel and Bretschneider (2013) suggest that the adoption of new technologies, like social media, depend on the presence of staff innovators. While they developed this theory for government organizations, some scholars have suggested that it is applicable to the nonprofit sector as well. Mergel and Bretschneider identify three stages organizations go through in the adoption of new technologies. The first is "intrapreneurship and experimentation" (p. 391), in which individual innovators introduce a new technology into the organization. In this stage, an employee may experiment with a new social media program in one part of the organization before it is adopted elsewhere or widely in that organization; the second phase is "order from chaos" (p. 392), in which managers begin to establish norms for the use of new technologies; and finally, "institutionalization" (p. 392), in which standards and policies for use of the technology are established for the whole organization.

## Social Media Use

Most of the early research on social media and nonprofit organizations, completed in the years following the advent of Web 2.0 (generally, through 2013), explored the extent to which nonprofit organizations have used social media to facilitate dialogues with stakeholders. These studies found nonprofits were generally not utilizing these applications in the way some scholars and practitioners had originally envisioned. Research by Lovejoy and Saxton (2012) suggests that social media use has evolved in a different way. The framework they developed moves beyond the binary discussion regarding whether nonprofit organizations use social media for dialogic purposes. Instead, it conceptualizes nonprofit organizations as using social media for three primary communication purposes: (1) to convey information (sharing news about the organization and its work or other mission-related news), (2) to build community (informing stakeholders about community events and recognizing those who are contributing either to the organization or the larger community), and (3) to encourage stakeholders to take action (asking fans or followers to do something in support of the organization, such as donating, volunteering, or contacting an elected official about relevant legislation). Although the framework was created as part of a study of Twitter, it has been applied to Facebook as well.

The three elements of Lovejoy and Saxton's framework comprise a "hierarchy of engagement" (p. 349) that captures how nonprofit organizations use social media to connect with stakeholders. Subsequent research on both Facebook and Twitter has shown that nonprofit organizations, across a wide variety of fields, use social media in these three ways. Further, within this framework, nonprofit organizations fall into three categories, based on the primary way in which they use social media, as "information sources," "community builders," or "promoters/mobilizers" (p. 348). Providing information, building community, and taking action are all tactics involved in carrying out core activities of nonprofit organizations, particularly those related to marketing, fundraising, and advocacy. In this way, the Internet and social media enhance the capacity of nonprofit organizations to perform essential management functions.

While the Internet and social media can help nonprofit organizations with a variety of tasks, as suggested above, some tools are more appropriate for achieving some goals. For example, nonprofit organizations tend to use websites and Facebook for marketing and fundraising, while Twitter is more popular for advocacy, though not

necessarily exclusively for that purpose. John McDermott, in his article *Why Facebook is for ice buckets, Twitter is for Ferguson* (2014), notes how two different simultaneous events, the Ice-Bucket Challenge and the Ferguson, Missouri protests, proliferated on different social media platforms. Facebook functions as a place to share information with family and friends, often in upbeat ways that are consistent with nonprofit organizations' fundraising and marketing messages. By contrast, Twitter acts as a news aggregator, and as such, a way to take action. The 140-character limit on Twitter, as well as the ease with which content links can be attached to tweets makes it simple to use for short, advocacy messages. In addition, its widespread adoption among journalists and political leaders, to whom it is easy to direct messages, make Twitter more effective for advocacy than other Internet-based tools.

## Conclusion and Future Direction

As noted, nonprofit organizations have made considerable use of the Internet and social media, particularly in ways reflective of the hierarchy of engagement developed by Lovejoy and Saxton (2012): they use them to convey information, build community, and ask constituents to take action. These activities are technology-based adaptations of core management functions, notably marketing, fundraising, and advocacy. At the same time, the nonprofit sector faces several enduring challenges with respect to social media use. Many nonprofit organizations have struggled to develop a strategy for Internet and social media use; and some researchers have noted that a lack of knowledge has led to uses that are either ad hoc or mimic the choices of other organizations.

Further, researchers have found only limited evidence that nonprofit organizations have realized the future envisioned by Kanter and Fine (2010) and Kapin and Ward (2013), in which nonprofit organizations use technology to create regular dialogue and achieve high levels of engagement with their stakeholders. The examples they use to make the case for this potential are mostly large, national organizations with significant capacity. Perhaps those organizations are leading the way in creating a future in which nonprofit organizations use the Internet and social media with greater sophistication. While the Internet and social media have clearly changed communication practices in nonprofit organizations, they have not yet realized the transformative dialogic potential envisioned by some researchers and practitioners.

# NPM and the Reform of the Civil Service System, Japan

Hiroaki Inatsugu
School of Political Science and Economics, Waseda University, Tokyo, Japan

## Synonyms

Civil service reform; New Public Management; NPM; Performance-related-pay; PRP

## Definition

NPM-type reforms started in late 1990s in Japan, and it facilitated civil service reform, especially introduction of performance-related-pay.

## Introduction

The Japanese academics as well as practitioners began to utilize the term, NPM (New Public Management), in the second half of the 1990s. In the meantime, notably, both the United Kingdom and New Zealand started to implement a NPM-type reform at the national level in the 1980s. In making a good contrast, the same type of reform started at the local level in Japan most probably from the second half of the 1990s onwards. In particular, Mie Prefecture (equivalent to province and state) was the first to discuss "NPM-type Reform of Local Government" in the Japanese administrative environment. This becoming as an initial attempt, the NPM reform developed popular to the extent that the Administrative Reform Council in the central government started to pay attention to NPM. This in turn facilitated the discussions among central government officials about the utility of this new type of government reform.

## NPM in Japan

Many scholars observe that NPM-type reforms were not promoted to a high degree in Japan until the first half of the 1990s. In the international comparison that Naschold made based on OECD data and his own survey data, Japan was one of the countries that incorporated NPM-type reforms the least (Naschold 1996, pp. 20–24). The reason for the nondiffusion of NPM policies in Japan includes relatively good economic performance until the late 1980s and linguistic and legal differences between Japan and Anglo-Saxon countries such as the UK and New Zealand.

However, the Japanese were exposed to the NPM-type reforms because economic performance began to decline in the early 1990s, and administrative inefficiency became a popular issue due to distrust in government bureaucracy. In this context, the Administrative Reform Council concluded that NPM-type reforms should be promoted in a report on the matter in 1998. Responding to this, reforms such as the establishment of independent administrative agencies,

the introduction of a policy evaluation system, and government reorganization started in 2001.

Regarding policy evaluation and information disclosure, local governments took more of a leadership role than the central government. Advanced local governments had already been proceeding with various NPM-type reforms since 1995. It can be reasonably inferred that efforts by the Mie Prefecture and other local governments had diffused into local governments in other areas of the country.

## Reform of the Civil Service System in Japan and NPM

Japan enacted the National Civil Service Act in 1947 immediately after the end of World War II. This was followed by a number of reforms including restrictions on basic labor rights with featuring the establishment of the National Personnel Authority (NPA) as a substitutive measure. Other than these changes, Japan's civil service system has not drastically changed for more than 60 years.

According to this law and related regulations, each appointee should perform work evaluations of individual staff and take necessary measures. The result of this evaluation should be linked with special pay raises and bonuses each year as a form of PRP (Performance Related Pay). Although Japan tried to implement PRP very early on, it was more of a formality and was not actually executed, as PRP has been unpopular in actual practice. Such performance-based payments have, therefore, generally been made equally to all employees without differentiating among them.

As a result, no short-term differences in pay based on achievement have been evident in Japan's civil service remuneration system until quite recently. Rather, pay increases are determined via long-term competition, and the variances show in workers' lifetime earnings. In the case of the career group (fast track group who passed the highly competitive type-I examination), promotions (or lack thereof) to top echelon posts determine retirement age, retirement allowance, and the location and conditions of their Amakudari posts, the second career posts after retirement guaranteed by each ministry. In the case of the noncareer group, pay differences are gradual and based on promotions and pay raises, or the lack thereof. The chief characteristic of the pay system of Japan's national civil service has been that each occupational arrangement functioned as an accumulated awards incentive system.

Although such a system continued for more than half a century, the movement toward a new system began in the late 1990s. During that time, career bureaucrats were frequently arrested due to various scandals, including the arrest of an administrative vice-minister. Many of these scandals were exposed simultaneously and heavily covered by the media, causing a loss of faith in the bureaucracy.

As a response to these scandals, the central government established study groups to examine the civil service system, which started a serious discussion about reform. The Administrative Reform Council established by the Hashimoto Cabinet in 1997 embraced bureaucratic reform as a central issue. Around the same time, an investigative committee on the civil service system was also established. However, the effects of full-scale reform were not seen until the beginning of the twenty-first century.

A new governmental office system started in 2001 that included elements of NPM policy and a broad outline for the reform of the civil service system determined by the Cabinet. Several years later in 2007, an amendment to the National Civil Service Act, including performance-based evaluations and the establishment of human resource banks, passed through the Diet. The government had already conducted a trial of the personnel evaluation, but official personnel evaluation began with the passage of this amendment.

PRP, left unexecuted for 60 years in Japan, was finally instituted, signaling that the movement toward NPM policy had come to Japan. The separation of policy implementation and execution from the policy-making sector, another aspect of NPM, also began in the early 2000s, as did the establishment of independent administrative agencies. Initially, there were only a few public officials transferred to independent administrative agencies. Gradually, however, larger departments such as national hospitals and universities were

transferred to these agencies. The status of the independent administrative agency's staff became noncivil servant, as illustrated by the privatization of the postal service in 2007. Because of these changes, the number of national civil servants has sharply declined, from about 820,000 people in 2000 to 285,000 people in 2015.

Following the Basic Act on Reform of National Civil Service Systems in 2008, there was an amendment to the National Civil Service Act in 2014. The amendment included articles aiming to strengthen the Cabinet's personnel management functions and establish an executive personnel system for recruiting various human resources and flexibly managing personnel affairs. It was decided that the Chief Cabinet Secretary should examine the eligibility of applicants and prepare a list of candidates when appointing top officials. Additionally, the Minister in charge should consult with the Prime Minister and the Chief Cabinet Secretary when appointing or dismissing top officials. The Cabinet Bureau of Personnel Affairs was also established to take charge of bureaucratic organization, illustrating the historic background of NPM reform movement.

## Conclusion

Although Japan's attempts at implementing NPM-style reforms occurred later than in other nations due to economic factors and language barriers, it nonetheless embraced NPM policies when confronted with the same circumstances faced by other countries. These reforms significantly reshaped governmental bureaucracies and the civil service sector of Japan, signaling a new direction in the organization of public service agencies.

## Synonyms

Controls; New Public Management; Public enterprise restructuring; Traditional context

## Definition

New Public Management has been the preferred model for the delivery of public services since 1980.

Public enterprise restructuring involves restructuring public enterprises in order to make them more commercially viable and better providers of public services.

Traditional context refers here to a nonwestern, developing island context.

N

## Introduction

New Public Management (NPM) has virtually replaced traditional public administration as the preferred model for the delivery of public value since 1979 and 1980 when the UK and the USA, respectively, adopted a radically different approach to management in the public sector. Small government with larger private sector participation in public service delivery has become the "blueprint" for economic development. Contemporary reforms have largely focused on the public sector with governments aiming to introduce greater economy, effectiveness, transparency, accountability, and efficiency in the public service. In the process, governments have attempted to reduce both their commitment to and participation in economic enterprise. Public sector reforms, and in particular the restructuring of Public Enterprises, have thus become a

worldwide phenomenon. NPM, which attempts to address deficiencies found in traditional public administration, assumes that the market is preferable to government as a coordinator of social relations and public service delivery "since it involves transactions that are voluntary, lateral and decentralized, in contrast to the compulsory, hierarchical and centralized activities of government" (Beetham 1987, p. 33). This reliance on the market as an automatic "adjuster" raises a number of issues in the use of NPM in traditional settings like Fiji. This paper analyzes critically the main features of the NPM "model" and questions its suitability in the restructuring of Public Enterprises in a traditional context like Fiji.

## The Fiji Context

Fiji has gone through five coups de 'tat since gaining its independence from Britain in 1970. It is a developing island economy comprising 14 provinces with persisting tribal and kinship relationships still influencing national decision-making. In addition to this, Fiji has a sizeable Indo-Fijian population (37%) who are largely descendants of indentured laborers who came from India from 1879–1916 to supply the labor needs of the colonial administration (Norton 1990, p. 22). Institutions of public accountability were disrupted, destroyed, and heavily compromised after the 1987 coup (Lal 2000). From 1987 to 1995, national focus was on stabilizing the political landscape, enacting the 1990 constitution, organizing the 1992 and 1994 general elections, and consolidating the Soqosoqo ni Vakavulewa ni Taukei (SVT) government and Prime Minister Sitiveni Rabuka's leadership. Only in 1996 was the Public Enterprise Act enacted. Thirteen years later, only five of which were dedicated to strengthening and reestablishing necessary accountability mechanisms, another coup in 2000 shattered all expectations of predictability in the institutions of accountability and good governance. Both the coups were justified in the name of protecting the Indigenous community from the hegemonic designs of the Indo-Fijians. Provincialism, paternalism, political patronage, and nepotism thus became a part of everyday life making it extremely difficult to identify and expect conventional objectivity in public decision-making. This was bolstered by affirmative action programs and Indigenous considerations which became elevated to unprecedented levels. The hallowed principles of meritocracy and considered objectivity, therefore, virtually ceased to operate in the public sector in Fiji. A coup was executed in December 2006 partly in reaction to this increasingly overwhelming tendency for compromising objectivity in government conduct. At this point in time, Fiji has an interim-government that operates in a constitutional vacuum with a standing promise to draft a constitution that ensures non-particularism in public decision-making. These factors, coupled with the fact that Fiji is not endowed with an abundance of potential service providers who could effectively deliver on competitively acquired government contracts, make it virtually impossible for the market mechanism to operate effectively in Fiji.

## The New Public Management Model

Public sector reforms have been part of discourse on management in the public sector for the past two decades even though the management and organization ideas contained in New Public Management (NPM) can be traced back to earlier debates in public administration (Savoie 1995, pp. 119–20). NPM attempts to introduce management structures, practices, and principles that are based on the precepts of freedom to choose and freedom to manage. It has been linked to the "New Right" in recognition of its attempts to incorporate normative concerns in what essentially remains the business philosophy of maximizing returns. This new ideology can also be referred to as the "Enlightened Left" in recognition of the fact that it has been embraced by traditionally left-leaning governments in their attempts to amalgamate the imperatives of both business and society (Appana 2003).

The literature on NPM does not exhibit uniformity on exactly what it constitutes, but the following ideas and initiatives appear to characterize NPM: use of hands-on professional management,

managerial autonomy, decentralization, use of explicit measures of performance that are output based, use of finance-based performance contracts and incentives systems, emphasis on discipline and parsimony in the use of resources, infusion of competition through disaggregation and delayering of government bureaus, use of contracts for public service provision by organizations external to the department/bureau in question, emphasis on citizen choice, and use of other private sector-type management practices (Hood 1991; Pollitt 1995; Boston, et al. 1996). On the other hand, there appears to be general unanimity on NPM's fundamental objectives of creating an innovative, flexible, problem-solving, and more entrepreneurial culture that is better adapted and more adaptable to a changing environment (Barzely 1992; Kettl 1997; Rosenbloom 1998). The NPM model, therefore, attempts to address the more obvious and disruptive shortcomings of traditional public administration. Its main features are analyzed in use in some detail in the next section.

## Professional Management

The emphasis of NPM is on the use of hands-on professional management where a successful manager with a proven track record is located and given active, visible, and discretionary control over a public entity with clear allocation of responsibilities, and corresponding accountability appears to place total reliance on the professional manager to meet performance expectations. In line with the tenet of "freedom to manage," the NPM manager can choose whatever approaches and techniques he considers appropriate in order to meet expectations. And in a clear attempt to move away from the rules/procedures focus of traditional public sector management, the evaluation focus is on output controls with the need to stress results rather than procedures. Thus, like in most private sector approaches, managerial performance is gauged ex post on the basis of results that are evaluated against targets that have been mutually spelt out prior to commencement of duties.

With the restructure of Civil Aviation Authority of Fiji (CAAF) into Airports Fiji Ltd. (AFL) and Civil Aviation Authority of the Fiji Islands (CAAFI) in 1998, Chief Executive Officers (CEOs) were sought for both entities in an attempt to recruit the best two people for the crucial positions on which the whole civil aviation industry and, therefore, tourism (Fiji's largest industry) hinged. A foreigner was recruited for AFL whereas a local filled the CAAFI post. A marked difference was seen in the degree of freedom that each demanded as CEO on their employment contracts. This created an immediate inequity in decision-making powers. Furthermore, as governments changed, new CEOs were recruited to meet the requirements and expectations of these governments. This was more so with AFL, which has now got its fourteenth CEO in twenty years, largely because it is a commercial entity with all its ramifications. CAAFI, on the other hand, has had a less turbulent history because it merely carries out the regulatory functions of civil aviation in Fiji and has no real commercial significance. Furthermore, NPM's insistence on recruiting managers with proven track records has repeatedly been compromised in the appointment of CEOs. The CEO/AFL appointed in July 2003 had been a dedicated bureaucrat in the Prime Minister's (PM's) office. The most potent justification for his appointment could be seen in the fact that AFL was a fragmented organization that needed an "outsider" with considerable human relations skills to refocus it. It is, however, difficult not to propose that the same qualifications could have been found in someone else with the necessary track record. Additionally, there was considerable appeal in speculations that his appointment had a lot to do with his proximity to the PM and the Soqosoqo Duavata ni Lewenivanua (SDL) government's "blueprint" objectives of the time. The CEO/AFL position is currently held by an acting appointee.

The adjunct issue of degree of managerial autonomy in NPM appears hazy in literature. On the one extreme, the rules and procedures-ensconced manager operates in a clearly prescribed, predictable work environment. On the other end, managers enjoy a strong form of

institutional autonomy where their decisions are not subject to either prior approval or retrospective appraisal. This form tends to raise the question of democratic accountability of governments as it weakens substantially the link between the public manager and government. The lack of clarity in this link between the bureaucrat and their political head in the traditional public administration model often led to "political interference" which has widely been cited as a "weakness" of that model. It also tends to weaken the ability of governments in using public entities to fulfill their roles as providers of public goods and custodians of the public good. Thus, somewhere in the middle of this continuum lies a third positioning of the public manager where he/she has some degree of discretionary powers in decision-making while being held answerable to politicians who can direct them within prescribed limits. This is the type that is used predominantly, largely because of its political appeal. Restrictions are placed mutually between the CEO and the government (or Board) via contracts, which also allocate risks of blame between politicians and managers. This intermediate form is a hybrid that attempts to strike a delicate, and at times politically problematic, balance in creating the "decision space" for the public manager.

In Fiji, this "decision space" is determined not only by the formally negotiated employment contract of the CEO, but also by a number of subjective considerations that are linked to the context. AFL's fourth CEO was appointed by a board that he had chosen earlier in his capacity as the then (2000) interim Minister for Civil Aviation. There would, therefore, have been no negotiations on his powers. He subsequently proved this by getting involved in a major row with the Fiji Public Service Association (FPSA) where he refused to entertain both negotiations and prounion court decisions. This refusal to implement court decisions stemmed from a firm belief that the AFL board would not act against him. There was silent acknowledgment of the reason for the paralysis of the board being the fact that the new Minister for Civil Aviation came from the same province as the controversial CEO. This embarrassment continued until 2003 when the government appeared to have been forced to appoint a new minister. Subsequent noncompliance by the CEO led to his belated dismissal in March 2003. Mechanisms for the evaluation of managerial performance are discussed later on in this entry.

## Private Sector Styles of Management

NPM goes on to prescribe a greater use of private sector styles of management practices in the public sector. It specifically mentions short-term employment contracts, strategic planning, performance agreements, performance-based pay systems, new Management Information Systems (MIS), and a greater concern for corporate image (Hood 1991; Boston, et al. 1996). These are clearly aimed at changing worker attitudes from a public sector type complacency and status quo orientation to a more private sector type vigorous and proactive orientation. Monetary incentives rather than non-monetary ones are emphasized in order to elicit compliance and generate worker enthusiasm. This was the primary source of motivation prescribed by scientific management which has a heavy influence on new institutional economics, which in turn, informed NPM. The prescriptions mentioned here are only a few in a whole range of options that the NPM manager is allowed to choose from in their efforts to deliver expected outcomes. In Fiji, the civil service culture was extremely difficult to supersede because it was heavily influenced by and imbued with traditional structures. Traditional chiefs, for instance, continued to be given precedence over commoners in public appointments. This was clearly an attempt to utilize traditional structures in a context of professional management. Even though this is not necessarily a weakness per se, a traditional chief is likely to raise potentially damaging traditional expectations within a modern workplace. This could compromise the professionalism required within NPM. The profit bottom-line, a distinguishing characteristic of private sector styles of management, is largely compromised in these instances. In addition to this, NPM does not prescribe clearly (apart from disaggregation and the use of contracts) the means to achieving its well-articulated ends. This opens up a host of

alternatives that the manager can choose from. And managers with bureaucratic backgrounds that are closely linked to traditional structures would be tempted not to use unfamiliar entrepreneurial approaches in unstable settings. NPM attempts to overcome these problems by featuring explicit standards and measures of performance with a preference for output-based controls.

## Performance Measures and Output Controls

NPM lays great emphasis on placing responsibility and accountability at the same point on the public organization in a direct departure from traditional public administration where the doctrine of ministerial responsibility renders the public manager/official anonymous. This doctrine of ministerial responsibility means that the minister accepts responsibility for both the actions of the public servant as well as contractors who may carry out public work. The anonymity operates as a major impediment in affecting accountability in the public sector. However, with NPM, the principle of alternative delivery makes agents like the CEO/AFL and the CEO/CAAFI responsible to the ministers as well as any other partners involved in the arrangement (Lindquist and Paquet 2000). NPM also features explicit standards and measures of performance with a preference for output-based controls. This links a person's actions more closely with consequences that are also direct and range from firing to unprecedented rewards.

The employment package of the first CEO/AFL was reported to have been well above the quarter million-dollar mark. All successive AFL/CEOs have enjoyed the same types of relatively astronomical employment packages. This has the tendency to create envy and resentment in a context like Fiji where similar paying jobs are rare in the private sector. On the other hand, widespread public service experience and knowledge make it extremely difficult to accept that the compensation packages are matched by commensurate effort. In fact, there was a growing perception that public enterprise postings were being used by government to "reward the boys" for services rendered during the pre-2000 coup upheavals, the coup itself, and its aftermath when some $25 million was disbursed without adequate control for agricultural assistance. These allegations also hound the post-2006 government even though the focus is largely on the appointment of military personnel to civilian posts.

On the other hand, for effectively evaluating the performance of CEOs as well as Public Enterprises, it is important to have explicit standards and measures of performance that are clearly spelt out. Clear objectives and timeframes need to be set for effective control as necessitated by the accountability provisions of NPM. Setting clear objectives in the public sector is a task fraught with difficulties and contradictions. First, it is difficult to lay out and quantify sociopolitical objectives. Second, it is often politically imprudent to specify economic objectives especially if they are likely to prove unpopular. And third, political concerns of governments and economic concerns of Public Enterprises might not be compatible as is seen in the requirement of Fiji's "Blueprint" that 50% of all public contracts be awarded to ethnic Fijian businesses (Fiji live 2002; Te Karere 2000). The "Blueprint hoped to bring about 50/50 parity in the participation of ethnic-Fijians in Fiji's business sector by the year 2020; Public Contracts were seen as a major means of accomplishing this. This not only makes it difficult for the CEO to meet set economic targets, but it also makes it difficult for government to enforce the performance provisions of the contract if targets are not met. On the other hand, traditional positions and affiliations made it extremely difficult to punish or remove CEOs (and other public officials) for non- or questionable performance as seen earlier in the case of the AFL/CEO who was removed after performing without any controls from January 2001 to March 2003.

## Disaggregation and Competition

Furthermore, in an attempt to ensure the adaptability of private sector styles of management in the public sector, NPM proposes disaggregating

large public sector organizations into "corporatized units around products" funded separately and interacting with one another on an "arms-length" basis. This is clearly aimed at streamlining and removing size complications from cumbersome public entities so that it becomes easier to manage them in a private sector manner. However, in order to disaggregate effectively, governments' commercial and noncommercial activities need to be clearly identified, demarcated, and separated. Justification for this is seen in the need to create manageable units and "to gain the efficiency advantages of franchise arrangements inside as well as outside the public sector" (Boston et al. 1996). Improved reporting, monitoring, and accountability mechanisms need to accompany this shift. There are a number of problems associated with this especially in developing country contexts. First, it is not easy to demarcate exactly what government activities can be classified as "commercial" because private sector provision might not be feasible. Some activities like providing water are more problematic to commercialize than providing electricity. Second, disaggregation could easily lead to duplication in the use of scarce public resources that countries like Fiji can ill afford. The creation of AFL and CAAFI from CAAF in Fiji highlights this phenomenon to some extent as lots of new equipment was either "lost" or had to be purchased during the restructure. In an interesting twist, AFL's state-of-the-art air traffic control equipment was being used by Strategic Air Services Ltd. (SASL) to provide air traffic management services to AFL under extremely unclear and "uncommercial" terms. This stemmed from an over-emphasis on the requirements of the "Blueprint" to "assist" Ethnic-Fijian entry into the commercial sector. Here, state assets paid for and held by AFL were being used by a private company with virtually no returns for resource use to AFL.

## Contractualism

NPM proposes the introduction of more competition in the public sector through the use of competitive public-tendering procedures, term contracts, and devolution so that costs are lowered and delivery standards improved through the introduction of market stimulus. Therefore, it exhibits a preference for private ownership, contestable provision, and contracting out of public services. However, despite the intentions of contractualism and the structures that have been put in place to facilitate its use, principal/agent relationships are fraught with complications that inevitably affect the restructuring process as well as organizational performance. Agency Theory, a key theory behind NPM, says that social and political life can be understood as a series of contractual arrangements between principals (parliament, ministers, CEOs, etc.), and agents (CEOs, workers, suppliers, etc.). These contracts should be professional rather than relational in nature for maximum benefits.

Information asymmetry arises when agents have access to information that principals do not, or vice versa. This creates an incentive to exploit the information gap for personal gains, which could be detrimental to the greater good. When Fiji Post and Telecommunications Ltd. (FPTL) was disaggregated into Post Fiji and Telecom Fiji Ltd. (PFL) in 1996, the first Chief Operating Officer (COO) was an Israeli with dubious American academic qualifications. The fact that his Master's Business Administration (MBA) was not authentic only came to light after questions emerged within the organization due to tightening tension between the then Managing Director (MD) (Emori Naqova) and the COO (Aharon Amit). This case serves to highlight the fact that governments usually do not have the means to verify personal data provided by aspirants to key positions in Public Enterprises. They may even choose to ignore the verification process because of covertly articulated preferences from positions of power. This can lead to the problem of adverse selection, which consequently begins to plague the organization. In the case of Telecom Fiji Ltd. (TFL), COO Amit left the organization in disgrace before his contract had expired. There were unconfirmed reports that in a baffling twist, government paid him $5 m for the unserved portion of his contract and "services rendered."

It is obvious that contractualism is used in NPM partly to place restrictions and controls on the behavior of agents (and to some extent principals). The assumption is that market forces would enhance this control requirement in a free environment where contracts can be both contested and enforced. Unfortunately, a joint economic study by the Reserve Bank of Fiji (RBF) and the University of the South Pacific (USP) found that the nonenforceability of contracts and corruption are a major impediment to investment in Fiji (Fiji live 2003). Furthermore, Public Enterprises in Fiji do not have access to sizeable numbers of service providers. SASL, for instance, was awarded the contract to provide Air Traffic Management (ATM) services without having to go through a truly competitive public-tendering process. Air Terminal Services (ATS) provides ground-handling services based on a preferential contract that was signed prior to the restructure but continues to be operational because 51% of ATS shares are held by CAAFI. Furthermore, contracts tend to attempt to constrict the ambit within which service providers can operate. These centralizing tendencies grate against the devolutionary focus of managerialism creating tensions and confusions. In order to attempt to overcome these shortfalls, focus has to move on to the governance structures of NPM and the wider environment, but that falls beyond the ambit of this entry.

## Conclusions

It can be seen here that NPM is faced with a multitude of unique and not so unique problems when it is used for the restructuring of public enterprises in a traditional context like Fiji. Its emphasis, on using private sector styles of management with a professional manager hired on contract, faces distinct problems. First, the hiring process itself can be compromised by uncontestable subjective considerations. Second, it is difficult to determine and prescribe exactly how much "freedom" the manager should have. Third, political objectives that governments are preoccupied with cannot be articulated in concrete terms for various reasons. They are also often difficult to align with the economic imperatives of management. This makes the appraisal of management performance an exercise fraught with difficulties. On the other hand, it is extremely difficult to punish unacceptable performance because of traditional considerations that may mitigate against taking a hard-line approach.

Furthermore, NPM's emphasis on market control of organizational performance does not operate in the expected manner for a number of reasons. First, it is difficult to clearly demarcate government's commercial and noncommercial activities for effective restructuring. Second, the setting up of separate entities incurs additional costs emanating from a forced duplication of resources. And third, the monitoring and accountability mechanisms that are then needed become very complex and difficult to implement. In addition to this, market forces are introduced via competitive public-tendering processes. This is an exercise fraught with difficulties because of the pitfalls of information asymmetry, uncertainty, adverse selection, and moral hazard. On the other hand, the fact that the Fiji economy is not endowed with an abundance of specialist service providers makes NPM's reliance on the market, and the use of public-tendering processes as well as service contracts, virtually meaningless at times. Thus, there exist a range of factors that render the use of NPM in public enterprise restructuring an extremely problematic proposition in a traditional context like Fiji.

## Obstacles to Collaborative Decision-Making Among Counterterrorism Organizations

Nancy Achieng Odhiambo, Nixon Muganda Ochara and Armstrong Kadyamatimba
Department of Business Information Systems, University of Venda, Thohoyandou, South Africa

### Synonyms

Collaborative decision-making; Counterterrorism; Interagency information sharing; Terrorism; Wicked problems

### Definitions

The following definitions are adopted in relation to this contribution. *Collaboration* is the coming together of different stakeholders and arriving at a decision (consensus) based on all the stakeholders (decision-makers) preferences. *Collaborative decision-making (CDM)* is a collective process of decision-making which results in arriving at a unanimous decision. *Counterterrorism organizations* are national and international agencies that seek to detect, prevent, and respond to terrorism acts.

### Introduction

Collaborative decision-making (CDM), according to Owen (2015), is a participatory process which involves multiple stakeholders/decision-makers acting collectively as one, to analyze a problem situation and to evaluate and consider alternative course of action. Rittel and Webber (1973) refer to problems whose resolution require CDM as complex and "wicked," since they are ill-structured, ill-defined, dynamic, and messy in nature. For instance, the rapid increase in population growth, the emergence of new technologies and globalization has resulted in numerous challenges and opportunities to the society that are complex and *wicked* (e.g., terrorism, corona virus, global warming, climate change, and poverty) and to organizations (e.g., increased competitiveness, changes in business environment, and increased travel costs) (Adla et al. 2012; Heslin 2009; Jung et al. 2010; Turban et al. 2011). To address these challenges, organizations and governments are compelled to bring multiple decision-makers/stakeholders together from different organizations with different experiences, skills and creativity, regardless of their geographical location, to jointly work together collaboratively to address these "wicked" problems (Jung et al. 2010).

The increased use of CDM practices among policymakers, academicians, and decision-makers

© Springer Nature Switzerland AG 2022
A. Farazmand (ed.), *Global Encyclopedia of Public Administration, Public Policy, and Governance*,
https://doi.org/10.1007/978-3-030-66252-3

can be attributed to the increasingly widespread perspective that partnerships could be hardy in addressing the current complex and "wicked" problems which calls for multisectoral collaborations (Dentoni et al. 2018). This is because conventional and traditional decision-making approaches that were characterized by individuality, unilaterality, centralization, and hierarchy are nowadays outdated (Kapucu and Garayev 2011). However, despite the attractiveness of CDM in complex and "wicked" problem situations, its attainment is inhibited by a number of factors presented in literature by various scholars (see Bond-Barnard et al. 2018; Gil-Garcia and Sayogo 2016; Howes et al. 2015; Islam et al. 2015; Prichard and Moore 2016)). Thus, to contribute to this debate of gleaning the factors influencing inter- and intra-CDM processes especially between and among counterterrorism stakeholders/organizations a conceptual framework is proposed and tested in this research study. The rest of the study is organized as follows: In section literature review is presented followed by underpinning theory in section "Theoretical Approach." Section "Methodology" provides the methodology adopted and thereafter followed by a presentation of results in section "Results" and a conclusion in section "Conclusion."

## Literature Review

The increased adoption and use of CDM practices between and among organizations/decision-makers/stakeholders is largely attributed to the complex and the "wicked" nature of problems that organizations and the society are plague with of late (Dentoni et al. 2018; Kapucu and Hu 2016). Successful CDM practices are usually predicated upon by collective decision-making, information and resource sharing and coordinated intervention (Office 2014; Wu and Chang 2018). Studies have shown successful CDM practices are essential in healthcare (Stiggelbout et al. 2015), emergency and disaster management (Kapucu and Garayev 2011; Wu and Chang 2018), supply chain (Neubert et al. 2018), governance (Klievink et al. 2016), construction (Oppl 2017), etc. However, although CDM practices are stated as successful and instrumental in addressing complex and *wicked* problems such as counter terrorism, its successful implementation is influenced by several factors some of which are described here in.

### Organizational Form

Every organization regardless of its location (region, country, or sector) has organizational characteristics that are peculiar to itself (Rus and Rusu 2015). These characteristics entails the culture in the organization, leadership styles, beliefs, values, rules and regulations, norms, perceptions, structure, etc. Smircich (1983) pinpoints that organizational culture, for instance, is strong and consistent and often has an overwhelming influence of an organization and on the employees behavior (p. 21). This therefore can influence the effectiveness of CDM process in intra- and interorganizational collaborations (Kapucu and Garayev 2011). This is mainly caused by the fact that every organization has its own unique modus operandi that may be either at variance or at odds with each other and hence inhibiting smooth flow of CDM processes (Glomseth et al. 2007).

### Information and Knowledge Sharing

For effective CDM process to occur, there is need for easy flow and exchange of information and knowledge among and between the involved decision-makers/stakeholders/organizations.

Abbas et al. (2018) pinpoint that this can easily be achieved if there are guiding rules and policies on how information and knowledge is to be shared. Equally, free movement of information and knowledge is attached to open communication among and between the involved stakeholders in inter- and intra-CDM process. However, factors including lack of policies and guidelines (Abbas et al. 2018), information technologies (IT) capability, usability and interoperability, stakeholders differences, privacy, confidentiality, and security (Holen-Rabbersvik et al. 2018) are mentioned in literature as a hindrance to information and knowledge sharing in collaborative process and therefore impedes the effectiveness of inter- and inter-CDM processes.

### Trust

Trust-based partnerships are essential for the overall success of CDM processes (inter and intra) (Hassan et al. 2012; Kapucu and Garayev 2011; Martins et al. 2017). This is because mutual trust between and among decision-makers/stakeholders is important for information and knowledge sharing (Akbulut et al. 2009; Praditya and Janssen 2015). Thus, trust promotes better working partnerships and environments for different organizations and decision-makers working collectively in a group as collaborators (Agranoff 2007). Equally, trust is vital for CDM processes as it can reduce transaction costs, strengthen network ties, and enable collective actions (Isett et al. 2011). Unfortunately, determining the level of trust among participating stakeholders in CDM process is challenging (Kapucu and Garayev 2011). Pardo et al. (2008) state that clarity of roles and responsibilities, appropriate roles of authority and respect of authority could be used to build trust within and across organizations, which can thereby result into the success of inter- and intra-CDM processes.

### Organizational Cooperation

Effective achievement of CDM processes requires both cooperation and coordination of the involved stakeholders/decision-makers/organizations (Tee et al. 2019). In complex and *wicked* problem situations where CDM is vital, presence and absence of mutual trust (Bond-Barnard et al. 2018), divergent organizational goals and time horizons (Fürstenau et al. 2019), and stakeholders needs can either promote or inhibit stakeholders cooperation, and yet organizational cooperation has been shown to be instrumental in enhancing innovative capabilities for addressing complex and "wicked" problems (Drasch et al. 2018). Nevertheless, poor cooperation, as evidenced by failures in 9/11 terrorist attacks, is linked to poor response times, planning, and more fatality (Prezelj and Airey 2016). Hence for effective CDM especially in complex problem situations such as terrorism, there is need for better cooperative practices among and between the involved organizations/stakeholders/decision-makers.

### Technological Infrastructure and Interoperability

Technological infrastructure is not only a core component of inter and intraorganizational collaborations but also plays a critical role in relaying, sharing, and passing information from one point to the other in CDM processes. However, one of the biggest challenges plaguing technological infrastructure in CDM instances is the technical infrastructure in place as well as, how an organization has adopted and implemented technologies (Abbas et al. 2018; Fedorowicz et al. 2007). Due to outsourcing practices by many organizations, different organizations use different technological infrastructure which leads to the challenge of interoperability during inter- and intra-collaborative processes and hence an impediment to the success of CDM processes.

### Informal Relationships

Informal relationships among and between stakeholders are good for effective CDM processes. This is because informal relationships remove communication constraints and build trust among workmates which is good for collaborative practices (Amjad et al. 2015). In absence, could be a hindrance to an effectiveness of inter- and intra-CDM process.

Figure 1 gives the conceptual framework proposed in this paper presenting the hypothesized relationship between CDM and organizational form (OF), information and knowledge sharing

**Obstacles to Collaborative Decision-Making Among Counterterrorism Organizations, Fig. 1** Conceptual model representing CDM obstacles

(IKS), informal relationships (IR), organizational cooperation (OC), and technological infrastructure and interoperability (TI).

## Theoretical Approach

Institutional theory is adopted in this study as a guiding lens in explaining how institutional environment influences and establishes an organization's structure, norms, and rules, and how these become resilient, legitimatized guidelines for social behavior in an organization (DiMaggio and Powell 1983; Meyer and Rowan 1977). In employing institutional theory in this research, the argument is that organizations are variously comprised of "cultural-cognitive, normative and regulative elements that, together with associated activities and resources, provide stability and meaning to social life" (Scott 2001, p. 48). *Cognitive-cultural pillar* – relies on shared beliefs (culture) and is dependent on individual cognition. *Normative pillar* – consist of values, standards, norms, etc. which shapes organizational activities and processes. *Regulative pillar* – consists of regulations and laws (informal and formal) which structure organizations activities. Thus, to understand the extent in which organizational behavior influences intra- and inter-CDM processes especially among counterterrorism organizations, institutional theory was used.

## Methodology

### Research Design

Using cross-sectional survey design, semi-structured questionnaires were administered to counterterrorism organizations in three African countries (Kenya, South Africa, and Nigeria) both physically and electronically. Kenya and Nigeria formed part of the study due to the increasing terrorist attacks in the two regions. South Africa formed part of the study because it is one of the major economies with a significant advancement in ICT in the African continent. The sampling technique followed was purposive.

### Validity and Reliability

In order to ensure face and content validity, a group of fellow researchers went through the developed research instrument to check for errors in terms of structure, grammar, sentence construction, and relevancy of the items to the constructs being measured. In addition, to ensure construct validity in other words, if the instrument measured what it was intended to measure a pilot study was done. Further, following Rovai et al.'s (2013) advice, the degree of homogeneity (internal consistency) among the items used in the questionnaire was also assessed (see Table 1).

## Results

Cronbach's alpha values and multiple linear regression technique was used in this study to determine the homogeneity of the items used in the questionnaire and the influence of OF, TI, OC, DGR, and IR on CDM, respectively. The analysis was done using the statistical software R version 3.6.2.

### Reliability Analysis Results

As depicted in Table 1, the six constructs used in this study abided by the rules as the Cronbach's alpha values had a reliability value >0.7, which is acceptable (see George and Mallery 2003) guidelines.

### Multiple Regression Results

As shown from Table 2, OF significantly influences CDM ($p = 0.0012$) which is in agreement with previous studies that have shown a significant relationship between inter- and intra-CDM with the OF (e.g., structure, leadership, governance) (Andrews et al. 2015; Islam et al. 2018; Nutt 2006). In addition, organizational cooperation (OC) also significantly influences CDM ($p = 0.0000$). This is in line with previous discussions which have shown an association between CDM challenges and organizational cooperation (Liu and Zheng 2018; Tee et al. 2019). Table 2 gives the coefficients and the p-values of the fitted model.

**Obstacles to Collaborative Decision-Making Among Counterterrorism Organizations, Table 1** Reliability analysis results

| Constructs | Cronbach's alpha | No of items |
|---|---|---|
| Information and knowledge sharing (IKS) | 0.9 | 4 |
| Organizational form (OF) | 0.7 | 9 |
| Group/departmental relationships (GDR) | 0.9 | 4 |
| Organizational cooperation (OC) | 0.7 | 4 |
| Technical infrastructure and interoperability (TI) | 0.9 | 7 |
| Optimal CDM (OCDM) | 0.7 | 5 |

**Obstacles to Collaborative Decision-Making Among Counterterrorism Organizations, Table 2** Coefficients and p-values of the fitted multiple regression model

| | Estimate | Std. error | P-value |
|---|---|---|---|
| Intercept | 6.33947 | 2.48563 | 0.0116 |
| Organizational form (OF) | 0.15594 | 0.04718 | 0.0012 |
| Organizational cooperation (OC) | 0.61326 | 0.07693 | 0.0000 |

## Conclusion

CDM is one of the buzzwords of the twentieth century and is adopted mostly in complex and *wicked* problems solution, mitigation, and prevention lately. This can be attributed to the complex nature of problems the society and organizations are faced with nowadays which call for multi-dimensional skill sets. However, in situations where many stakeholders/decision-makers are involved, successful implementation of CDM processes is challenging especially in inter- and intraorganizational contexts. The findings from this study illustrate that CDM, among counterterrorism organizations, is influenced by the organization form ($p = 0.0012$) of the involved stakeholders and the extent of cooperation between and among them ($p = 0.000$). Therefore, for successful implementation and mitigation of terrorism-related incidences, counterterrorism organizations need to take the findings from this study into consideration.

# Occupational Safety and Health in Organizational Strategy

Marcia Nathai-Balkissoon
Department of Management Studies, The University of the West Indies, St. Augustine, Trinidad and Tobago

## Synonyms

Health and safety at work; Occupational health; Occupational health and safety; Workplace health and safety

## Definition

Matters related to protecting the safety, health, and welfare of employees, the public, and other groups who might be affected by work operations, often by reducing occupational risk to levels that are as low as practicably possible.

## Introduction

Organizational strategy is used by companies to plan how to achieve competitive advantage and then to implement that plan so that the company's ultimate goals can be met. The strategic goals of a company are likely to revolve around two interconnected themes: customer value and profitability. The better the customer's perception of value, the more likely profitability will result. Satisfied external customers support financial success. Satisfied employees (the company's internal customers) are also critical influencers of company success.

Occupational safety and health (OSH) supports business strategy in significant ways. Every day an organization does business, it faces risk. An employee or visitor could be injured, equipment could be damaged during the course of operations, or the company's customer could be hurt during the use of the company's goods. When such accidents or incidents occur, there are workmen's compensation, medical, and insurance expenses and other direct costs. The traditional view has been that safety is at odds with business strategy, since too many valuable resources are expended to set up a safety program, respond to accidents that have both financial and human price tags, and track safety performance statistics. However, the more modern perspective is that an OSH program is an investment that contributes to organizational success. Such an OSH program establishes organization-wide involvement in and ownership of the OSHMS and proper systems and structures that focus on continually improving OSH for the benefit of all stakeholders. The result of a progressive OSH program (USDOL 2016) is fewer and less severe accidents lowering insurance claims, medical costs, and workmen's compensation expenditure. In terms of indirect costs, the company experiences less lost time, lower staff turnover, higher employee morale and loyalty, lower overheads, and ultimately improved productivity. Thus, a good OSH program is not only morally advisable; it makes good economic sense (Fernández-Muñiz et al. 2009) because it promotes business success.

This article outlines many of the traditional parts of an OSH program, but it also looks at some newer points of view and practices being incorporated into OSH management systems so that OSH performance supports organizational success.

## OSH Oversight

### Emergence of Occupational Safety and Health as a Field of Practice

Around the beginning of the nineteenth century, countries including the UK and USA had been developing and adopting technology to churn out greater output volumes more efficiently. Such use of machines (in settings like mines, granaries, and factories) marked the Industrial Revolution's shift to mechanization. The use of different technology, untrained or undertrained workers, and even child workers resulted in great stresses on the systems and occupational safety and health fallout resulted. It was a common phenomenon for these low-paid workers to suffer from work-induced illness and disease, as well as injury and loss of life and limb. As word of the horrible work conditions and damage being suffered by the workers made its way into the newspapers, a public outcry eventually precipitated the emergence of occupational safety and health (OSH) as a field of practice.

### OSH Legislation and Supporting Documents

The high human cost of the Industrial Revolution influenced the UK to proclaim its Factory Act, promoting safe systems of work and establishing oversight measures including inspections and legal sanctions. By the latter half of the nineteenth century, improved OSH legislation was being put into effect. The USA launched its Occupational Safety and Health Act (OSHA) in 1970 and the UK followed in 1974 with the Health and Safety at Work Act.

Today, a large number of countries have enacted their own OSH legislation. To support the main OSH legislation, many also have further documents and systems such as standards, codes of practice, guidelines, and even e-government systems. OSH leadership for Europe is provided from EU-OSHA, with well-established OSH systems being in place in the long-industrialized nations like Germany and the UK. In Australasia, Australia, New Zealand, and China have focused on systems development and OSH research as well. In the Americas, the USA and Canada have strong systems. Both the UK and USA, for example, make resources available to companies and the public via their online OSH websites. These e-government systems use a range of social media modalities to connect with and involve the public, share accident statistics, guidelines, templates, e-links for reporting and querying, and a myriad of other content (Nathai-Balkissoon and Pun 2016).

However, the need for a focus on decent standards of work continues to be advocated by both the United Nations (UN) and the International Labour Organization (ILO). The UN has called for a focus on decent work in its Sustainable Development Goal Number 8 (UN 2016), while the ILO has structured accessible guidelines in its ILO-OSH 2001 guidelines (ILO 2009). This encourages many less-developed nations to advance their OSH systems, though some have made admirable steps forward. For example, a leading industrial nation in the Caribbean, Trinidad and Tobago, saw its OSH Act effected in 2004 and the highest-risk sectors such as construction being focused upon. Countries such as India have developed significantly, but OSH systems have not kept pace.

The strength or weakness of OSH implementation in companies and countries can be traced in part to the provision of support and enforcement by governments. The strongest OSH systems administer a combination of guidance materials, training and education, e-government systems, support staff, enforcement programs, and voluntary protection programs. While some of these elements are provided free of charge, many are extra services available at a cost to companies that opt-in or that desire extra services such as consultation, training, certification, or even copies of documents.

### The PDCA Cycle

Whether or not individual countries have strong OSH legislation and support systems, every country has companies at all levels of the safety continuum. A major determinant of company safety performance is its safety management system. A focus on continual improvement is widely accepted as key to excellent safety performance, and one advocated continual improvement model is the plan-do-check-act cycle (see Fig. 1).

**Occupational Safety and Health in Organizational Strategy, Fig. 1** The PDCA cycle applied within a safety management system

The *plan* stage includes definition of core values, and a clear safety policy complete with SMART safety objectives, as well as structuring of the organization to support effectiveness. A good organization structure includes hiring of competent OSH leaders and structuring relationships to prioritize safety (e.g., establishing a safety committee, promoting a safety culture, establishing teams). OSH arrangements to promote OSH must also be put in place, and these would include safe systems of work, such as OSH procedures and practices.

The *do* stage involves thorough implementation of action plans, such as the conduct of risk assessments, mitigation of risks, training of staff, writing of procedures, and so on. The *check* phase revolves around measurement of OSH outcomes and comparison of those outcomes with preset OSH objectives. The company then takes stock of where performance levels have met objectives, exceeded targets, or fell short. Finally, in the *act* stage, the company responds to the checked outcomes. Examples of actions would be celebrating success, adjusting objectives upward or downward, delivering training, and taking administering disciplinary measures. The **plan** is then revisited and revised as needed, and the cycle begins again.

## OSH Hazards and Risks

### Hazard Versus Risk

A hazard is a factor that has the potential to cause harm. A risk is a combined evaluation of the likelihood that such harm will occur and the expected severity of damage if harm results from the hazard. A risk evaluation may be qualitative (e.g., high, medium, or low risk), or it may be quantitative (using number ranges to relate risk likelihood and severity).

### Risk Assessment

OSH legislation typically mandates the identification of hazards present in the workplace, the evaluation of risks posed by those hazards, and the implementation of measures to suitably and sufficiently mitigate those risks. This is the role of "risk assessment." According to the HSE (2014), a risk assessment can be conducted in just five steps:

1. Identify potential hazards in the workplace.
2. Determine the persons or groups who might be harmed by each hazard and how they might be harmed.
3. Evaluate the risk level and how to reasonably mitigate (eliminate or reduce) the risk so that any residual (remaining) risk is low.
4. Record the risk assessment findings.
5. Perform regular reviews and update the risk assessment in response to changes within the workplace.

### Hazard Identification

Work environments typically contain a myriad of hazards, potentially spanning all categories. Therefore, comprehensive reviews should be undertaken by a diverse team to thoroughly identify hazards.

**Physical Hazards** The widest ranging group of hazards is the "physical hazards" category. These include factors such as mechanical, automation, and technology hazards; slip, trip, and fall hazards; lifting hazards; temperature (heat and cold) and pressure hazards; electrical hazards; fire hazards; noise and vibration hazards; and light hazards. From this list, it can be recognized that physical hazards are factors that can cause harm to the body, sometimes even without touching the body.

The design of workspaces and the nature of the work itself might pose "ergonomic hazards" yet another type of physical hazard. Ergonomic hazards include the use of unsuitable work methods, poor posture at a workstation, improperly designed tools, and exposure to vibration from using tools. Exposure to ergonomic hazards might result in damage to a worker's musculoskeletal system, for example, muscles, ligaments, nerves, bones, and tendons. A worker sitting at a desk, for example, might have to stretch or work at an unnatural angle. A typist whose wrists are unnaturally curved while typing documents day after day could develop carpal tunnel syndrome, a type of repetitive strain injury. A mechanic bending over to work on a car engine for a long duration of time would find that his back muscles become tight and muscle strain and spasms might result. He would be susceptible to develop a range of musculoskeletal disorders because of the ergonomic hazards inherent in his work.

**Chemical Hazards** The "chemical hazards" category includes hazardous materials that could pose danger because of their reactive, toxic, carcinogenic, radioactive, flammable, explosive, irritant, asphyxiant, or other properties. Chemicals that could cause physical harm to the body are considered to be chemical hazards. For example, a lab worker could receive an acid burn if acid spills onto the skin during a procedure. The acid would be considered a chemical hazard. Someone using dishwashing liquid may become sensitized to cleaning agents or fragrances in the fluid, and this could result in acute or chronic eczema or other skin diseases. Also, some chemicals might localize in certain tissues and build up in concentration over time, with severe negative consequences. For example, lead in lead-acid car batteries dumped in a landfill can leach into soil and groundwater, thereby poisoning plants and livestock, which might then be ingested by humans. Children are most susceptible to lead poisoning (WHO 2016), which affects all organs and especially the brain, causing neurological damage, decreased IQ, and learning difficulties.

**Biological Hazards** "Biological hazards," also called biohazards, focus on microbiological agents that can cause disease or illness. Microbes could include bacteria, viruses, molds, fungi, algae, and parasites, some of which may be blood-borne pathogens carried in the blood and other body fluids. However, biological hazards can also include plants, animals, humans, and even toxins from biological sources. Exposure to biological hazards often happens through contact with infected persons or absorption of droplets (from coughing or sneezing) containing

microbes. Other means include transmission of an infectious agent when consuming contaminated food or using contaminated utensils, inhalation of infectious agents like spores, or infection when an insect bites or stings a person or microbes are introduced via an injection.

Biological hazards may cause a wide range of signs and symptoms in affected persons, including skin irritation, infection, acute illness, and chronic disease. One phenomenon, "sick building syndrome," comes about when there is contamination by mold, mildew, or other microorganisms (like viruses) and an issue such as poor ventilation compromises the air quality in the work space. Such infestations can lead to short-term and/or long-term health problems for building occupants, such as the development of allergies and respiratory illnesses.

**Psychosocial Hazards** "Psychosocial hazards" are a fairly new category of hazard that is being taken into account in workplaces. This category includes the threat of workplace violence (whether physical, verbal, or psychological) and the presence of high levels of negative stress on the job. Bullying, threats, battery, and other violent actions are examples of concerning behaviors in this group. Psychosocial hazards can negatively affect people, facilities, or even the functioning of the work operations, whether by causing overt damage to their short-term or long-term health and well-being or by reducing their effectiveness in less visible ways.

## Routes of Entry

Particularly with regard to chemical and biological hazards, routes of entry of a hazard into the body may need to be considered. As Fig. 2 illustrates, the most likely entry modes include inhalation through the nose or mouth; ingestion through the mouth; injection, including stings through the barrier of the skin; and absorption through membranes such as respiratory membranes, alimentary membranes, the conjunctiva of the eyes, and the skin. Foreign bodies or

**Occupational Safety and Health in Organizational Strategy, Fig. 2** The most common routes of entry of hazards into the body. (Image source: CC0 public domain image obtained at https://pixabay.com/en/man-tube-isolated-fig-pose-1076149/)

pathogens may enter when the skin is pierced by scratches, bites, etc., and entry may also take place through body orifices including the anus and urogenital tracts.

## At-Risk Groups

Many different persons may be harmed as a result of hazards caused by a company's work operations. These persons include, but would not be limited to, company employees. Therefore, the company must consider how harm may come about and those who may be affected, inclusive of non-employees such as contractors, visitors, customers, and the public. Within the employee category, special attention must be paid to those most susceptible to harm, for example, disabled workers, women (including new and expectant mothers for whom there may be risks to mother and/or a nursing child), lone workers (who may be at greater risk especially because they are working alone), young workers (who may be at risk due to their inexperience or immaturity), and aging workers (who could experience declining physical, cognitive, and sensory capabilities). When at-risk persons are identified, the circumstances in which they may be harmed should be carefully noted so actions can be implemented to adequately mitigate risks.

## Risk Evaluation

Risk levels must be evaluated by considering both the likelihood of harm and the expected severity of damage if such harm does occur. Such evaluations may be qualitative (e.g., deciding if likelihood of harm is low, medium, or high and if severity would be low, medium, or high), or they may be quantitative. Risk assessment matrices, used for quantitative evaluation of risk, are typically customized to suit the needs and priorities of each organization. A simple quantitative approach could be to assign numbers to each possible likelihood (L) and severity (S) level, then determine the ultimate risk level by multiplying L by S (see Fig. 3 for one approach to interpreting ultimate quantitative risk level).

## Risk Control: Including Safe Systems of Work

Once risk has been assessed, control measures need to be selected and implemented in order to eliminate or reduce risk within the organization. An effective safety system requires safe systems of work (SSWs) to be established for all

| (1-3) Low risk – manage using simple procedures<br>(4-7) Medium risk – continual improvement actions needed<br>(8-11) High risk – top management focus, bring risk as low as reasonably practicable<br>(12-16) Extreme risk – urgent action, top management intervention critical | | Level of Severity (S) of injury or damage | | | |
|---|---|---|---|---|---|
| | | Negligible = 1<br>Negligible injury and /or property damage | Minor = 2<br>Minor injuries requiring medical treatment / slight property damage | Major = 3<br>Major injuries, hospitalisation, permanent impairment / critical property damage | Catastrophic = 4<br>Fatalities and /or extreme business loss |
| Likelihood (L) of Harm | Improbable = 1 | 1 | 2 | 3 | 4 |
| | Occasional = 2 | 2 | 4 | 6 | 8 |
| | Likely = 3 | 3 | 6 | 9 | 12 |
| | Frequent = 4 | 4 | 8 | 12 | 16 |

Note: To calculate Risk Level (in colored spaces), multiply L by S

**Occupational Safety and Health in Organizational Strategy, Fig. 3** One example of a quantitative risk assessment matrix

operations carried out in the organization. This means that the organization would have carefully evaluated every job and task that it undertakes; developed an understanding of how people, processes, materials, equipment, and other variables interact in the course of the work; and clarified legal and performance requirements applicable to the work. A number of elements come together in good SSWs, and several of these are presented in this section.

**Accident Reporting and Investigation** Whenever accidents occur, a proper reporting and investigation practice is critical to help the company track accident occurrences, identify root causes, and take corrective action so that recurrence of the issue might hopefully be eliminated. Some companies also undertake reporting and investigation for near misses, negative safety occurrences that fall short of being accidents but whose causes could result in a future accident.

**Emergency Preparation** Preplanning should be undertaken to decide how to handle a crisis or disaster. This is a very involved element and is often wrongly judged as unimportant because emergency planning is not an urgent task. However, good emergency planning is critical to save lives, reduce resource expenditure, and get a company back in working shape as quickly as possible after a disaster occurs. Emergency preparation is most often undertaken for occurrences such as earthquakes, floods, bomb threats, fires, and hurricanes/storms. This aspect of safety management should involve all levels of the company hierarchy in creating plans, documenting procedures, and conducting drills. Further, resources should be procured and made available at accessible and secure locations, since many disasters occur without notice.

**Information and Communication** Training, information, instruction, and supervision are elements of a safety system that ensure that people know what is expected and that the system is designed so that regular interventions are made to realign any behaviors that stray from expected standards. Information and instruction could come from standard operating procedures, work instructions, material safety data sheets, safety signs, safety meetings, memoranda, orientation and other training programs, mentoring, and oversight from supervisors. Signs where pictures are used to communicate complex ideas are especially valuable in communicating with migrant workers who do not speak a country's native language. For example, it would be easy for all workers to understand the instruction from a no smoking symbol posted in an area where there is a fire risk.

**Medical Management** Medical surveillance programs can add value within safety systems. Screening for health risk factors and pre-existing conditions can be conducted prior to hiring new employees. Existing employee cases can be continuously reviewed to identify progression of previously noted challenges or to recognize emergent issues. With this knowledge, new employees can be assigned to do work that will not exacerbate existing risk factors, or existing employees can be relocated to lower-risk activities. This approach to managing medical risk would reduce occurrence of occupational exposure levels and occupational illnesses.

**Work Permits** It is critical to be aware of situations in which safety risks are heightened. Confined spaces are especially important in this regard. A confined space is an enclosed space where entry and egress (exit) are difficult and in which dangerous conditions and/or hazardous substances are present, posing risk of injury or death to workers and rescuers due to fire, explosion, asphyxiation, or loss of consciousness. A confined space could include biological or chemical hazards present in the space, which may or may not be known to the worker. For example, when entering an abandoned mine shaft, snakes could have made a den there. Also, when entering a hole in the ground, there could be pockets of dangerous gases, oxygen levels that are too high or too low, or even concentrations of bacteria that could endanger worker health or life.

Some companies believe that undertaking certain types of work poses such high risk that special permits to work must be used to control the work. These works often include work at heights, hot

work (including welding), work in confined spaces, high voltage electrical work, complex maintenance work, and contracted work. Permits control the work by specifying when and where the work is to be done; what work is to be done and on which equipment; hazards inherent in the work; control measures to be taken before, during, and after the work; procedures to be followed; who is responsible for the work; who is supervising the work; and who is to sign off on the work as evidence of satisfactory completion.

**Lockout-tagout** Before maintenance or service work is done in any area, it is critical to ensure that work systems are completely de-energized and that reenergizing cannot take place without the knowledge and consent of those performing the work. Lockout-tagout uses multiple locks (affixed by those performing the work) to lock the energizing mechanism in its "off" position and affixes a tag bearing information about the job that is about to be undertaken. The tag and locks would not be removed until the work is complete and each key holder removes his/her lock. In this way, it would not be possible to mistakenly reenergize a system while work is still in progress, and workers would be protected from untoward risk.

**PPE and the Hierarchy of Controls** PPE is often the first course of action to which people turn when risks are identified. However, according to the "hierarchy of control" decision-making framework, PPE should be the last port of call when selecting which type of mitigation action to apply for risk control. As shown in Fig. 4, in order of preference, five main action categories exist: (1) elimination, (2) substitution, (3) engineering, (4) administrative controls, and (5) personal protective equipment (PPE).

PPE includes popular gear such as gloves, safety glasses, safety shoes, earplugs, and hard hats. However, there is no standard type or design of PPE for use across all jobs, so care must be taken to select the most suitable type and design of PPE for each specific application. Careful attention is necessary to ensure that PPE fits each individual properly; for example, if a respirator is improperly sized and does not seal against a worker's face, leaking of poisonous fumes could lead to injury or even death of that worker. Workers must also be trained to understand how

**Occupational Safety and Health in Organizational Strategy, Fig. 4** The hierarchy of controls

to use, store, maintain, and monitor performance of their PPE. Finally, it must be noted that PPE has been found to be the least effective risk control measure, because workers expend considerable effort (and often bear discomfort) when using them. Also PPE only protects one worker at a time, where groups of workers benefit from every other measure in the hierarchy of controls.

## Safety Performance and Continual Improvement

Increasingly, OSH systems are being embedded within a single overarching business management system, instead of standing alone. This allows the company to maintain a single instance of common management practices such as performance measurement, nonconformance management, auditing, risk management, and continual improvement, instead of duplicating such processes in a safety management system, quality management system, environmental management system, and so on. This is treated with in greater detail in the chapter on integrated management systems.

Within OSH, performance management and continual improvement contribute to strategic success and the bottom line of the company. Setting objectives that align with company values and vision are necessary to stretch the company to raise its safety performance levels. In safety performance measurement, downstream, trailing, or lagging indicators (such as accident statistics) are popularly used, but it has increasingly been recognized that this approach to performance measurement is subject to misinterpretation and manipulation and too reactive to be used alone. Safety management should be strategic in nature, and therefore proactive, upstream, or leading approaches should be included, as these measure actions, behaviors, and processes that enable or promote safety (Podgórski 2015). Reactive or lagging indicators have little power to change safety performance since measurement is only done after problems, including accidents, have already taken place. In contrast, proactive or leading indicators drive positive change since they track interventions (such as safety training or mitigation actions implemented) that were designed to change safety behaviors and performance (Blair and O'Toole 2010).

Safety walkthroughs, inspections, and audits are observational activities that critically assess the extent to which selected elements of a safety system are in place, identify where shortcomings may exist, and direct responsive actions to improve the system accordingly. Improvement is also enabled by the practice of accident and incident reporting and investigation, since accident causation factors are ultimately identified, trended, and targeted for elimination.

Finally, companies have been establishing knowledge management and organizational learning mechanisms more formally in recent years (Pun and Nathai-Balkissoon 2011). This approach is also being applied within safety systems, so that the company is able to reflect on its experiences, learn from its successes and mistakes, and adapt its methods and leap ahead.

## Conclusion

Managing a company is fraught with risk. One major aspect of that risk is the occupational safety and health risk posed to employees and other stakeholders in the conduct of the company's work. This article has looked at major hazard types present in the course of everyday work activities, as well as approaches to evaluating and mitigating OSH risks that may be present in the workplace. Considerations for risk control were presented, including elements popularly included within safe systems of work. Finally, the importance of proactive performance measurement and several enablers of continual improvement were shared. It is clear that crafting and implementing a company's OSH management system is a complex and worthwhile endeavor. Further, a well-managed OSH management system would make valuable contributions to the operations of any organization and have a positive effect on its strategic success.

## Synonyms

Government monitoring; Government oversight; Government "watchdog"

## Introduction

Jurisdictions in the United States establish Offices of Inspector General (OIGs) to address issues of ineffectiveness, inefficiency, fraud, waste, abuse, and corruption in government. OIGs are not alone in performing a "watchdog" role in government. They perform their oversight alongside the legislative branch, the free press, civil society organizations, and citizens themselves. Nevertheless, all levels of government in the United States have increasingly turned to OIGs to provide oversight through the monitoring of the activities of their employees, contractors, and others by performing audits, investigations, inspections, and/or evaluations.

This entry reviews the history of OIGs in the United States and discusses the important issue of OIG independence as it affects their ability to perform their monitoring role. It then reviews what OIGs do (their role) and how they do it (their powers). While this entry mostly focuses on federal OIGs, it also offers some discussion of state and local OIGs as well.

## The History of Offices of Inspector General

In the United States, the title of inspector general dates to 1778, when Baron Friedrich von Steuben was assigned to assess and assure the competence of the Continental Army. Although inspectors general have continued to exist in the military, the modern history of the federal civilian OIG starts in 1959. At that time, Congress and certain federal agencies began to recycle the term with broader implications, imbuing the role with a measure of independence, auditing and investigatory powers, and the responsibility to promote efficiency and effectiveness (Feldman and Eichenthal 2013).

An independent, stand-alone audit agency had long provided oversight to executive agencies in the United States federal government. In 1921, Congress had created the General Accounting Office (GAO) to audit the "books" of federal spending transactions, with the goal of assuring that money allocated for specific public purposes was in fact spent for those purposes. With the enormous growth of federal government in subsequent decades, the GAO changed its role from financial oversight to performance audits and evaluations of federal government programs – often of those about which members of Congress have suspicions or questions. To reflect its new role, Congress renamed it "The Government Accountability Office" in 2004. Financial auditing duties no longer performed by the GAO were largely transferred to internal auditors located inside the executive branch agencies. In the meantime, the agencies also generally maintained separate internal investigative units focused on preventing fraud in the agencies' public programs. The first prototypical OIGs took on oversight duties in an effort to elevate accountability and program integrity as a priority within agencies that had been plagued with scandal and allegations of mismanagement (id.)

Experimentation with the idea of an OIG solidified in the 1970s. The atmosphere in Washington D.C. in the aftermath of the Watergate scandal, which led to the resignation of President Richard Nixon and increased demands for government oversight, sets the stage for Congress to create a system of OIGs. Thus, Congress passed the Inspector General Act of 1978 (the 1978 Act). The 1978 Act established new federal OIGs in each of 12 agencies. In doing so, Congress brought together two different approaches to oversight – audit and investigation – by merging existing auditing and investigations units into a semi-independent unit tasked to provide increased accountability from the agencies they oversaw (id.)

Today, the US federal government has 73 OIGs. As of 2018, federal offices of inspectors general collectively employ more than 13,000 employees and have a budget of more than $2 billion annually (Ginsberg 2017). They provide oversight of most large agencies along with many smaller regulatory boards. OIG oversight is not restricted to executive agencies, as there are several OIGs that have jurisdiction over legislative agencies. Further, special inspectors general have been created for multiagency programs, such as for the reconstruction of Afghanistan (Ginsberg and Greene 2016).

As the concept of the OIG has spread across the federal government, it has also trickled down to state and local governments as well. Although state and local OIGs are not as common, their numbers have been growing steadily. Furthermore, while the federal government OIG has been an influential model, states and localities have experimented with the concept (Kempf 2015). For example, with a few exceptions, federal inspectors general oversee only one specific agency. Some state governments have preferred the federal model and have created inspectors general for specific departments, like Corrections or Transportation, or for specific topics, like welfare fraud or long-term care. California created its OIG solely to oversee its correctional institutions (California Office of the Inspector General 2018). However, several states, counties, and cities have created OIGs with comprehensive oversight over all governmental functions, such as the Massachusetts OIG, which oversees the expenditure of all

public funds, whether federal, state, or local (Feldman and Eichenthal 2013).

Likewise, at the local level, the structures of OIGs vary. In the nation's largest city, New York, the City's Department of Investigation (DOI) is an umbrella organization for multiple inspectors general who oversee 45 municipal agencies, boards, and commissions (City of New York 2018). In Chicago, Illinois, an OIG oversees much of the city's activities; however, separate OIGs have been created for other functions such as the city's community colleges, parks, and housing authority (Association of Inspectors General 2018a). The Los Angeles OIG monitors the incarceration and policing operations of the County's Sheriff's Department (County of Los Angeles Office of Inspector General 2018). Seattle created its OIG to facilitate reform and integrity in that City's police practices (City of Seattle Office of the Inspector General for Public Safety 2018).

The growth of the number of OIGs across the country has given rise to a level of professionalism in the oversight sector. In 1996, the Association of Inspectors General was created. It provides training to OIG practitioners at an annual conference, provides support to regional associations, and offers certifications for inspectors general, OIG auditors, and OIG investigators (Association of Inspectors General 2018b). In short, the creation of a system of OIGs by Congress in 1978 has turned into a system of oversight across the country that few could have predicted.

## The Independence of Offices of Inspector General

Although federal, state, and local OIGs have varying mandates, the concept is the same: OIGs are to monitor the public agencies and programs within their jurisdiction. Ideally, this oversight is done with some independence from the agencies being overseen. Independence safeguards the objectivity of OIG findings, conclusions, and recommendations so that they may be relied upon by decision-makers. If this independence is not protected, it does not necessarily compromise the quality of an OIG's work, but it does invite challenges from critics. For instance, an inspector general who is subject to easy removal by an executive – who may be the subject of investigation or oversight by that same inspector general – is open to the charge of "pulling punches" to safeguard continued employment. On the other hand, an inspector general with a fixed term or one who can only be removed with the assent of the legislative branch cannot be accused of favoritism on these grounds (Feldman 2017).

OIG independence can be safeguarded in many ways. Besides protecting an inspector general from retaliatory firing, rules may require that an inspector general must be hired based on professional expertise and without regard to political party or other political connections. Hiring may be controlled by an external commission or other entity not subject to oversight by the OIG. Such hiring protections are intended to help minimize political influence over OIG activities. Also, the agency subject to oversight should not set the budget of its own OIG. This ensures that the agency cannot impose a monetary penalty in retaliation for an unfavorable report by the OIG. Further, an OIG should be prohibited from exercising line authority in the chain of command at the agency under review, because it would be difficult if not impossible for the OIG to be objective in reviewing its own operations (id.)

Some examples of independence protections afforded to federal inspectors general can be found in the 1978 Act. Certain inspectors general of large agencies are appointed by the president but also confirmed by the Senate, which provides a check on the president's actions. Inspectors general can be removed by their appointing authority, the president or an agency head, for any reason, but the appointing authority must give Congress 30 days' notice and an explanation, which exposes the removal to political and public criticism. In addition, by law, the OIGs are somewhat autonomous within their agencies, working with, but not controlled by, their respective agency heads. They hire and fire their own staffs, regardless of the preferences of their agency heads (id.). The 2008 Amendments to the 1978 Act further enhanced the independence of the OIGs by

eliminating the power of agency heads to make financial awards to inspectors general for "merit" via bonuses and gave OIGs their own counsel, so they were no longer dependent on agency counsel, who might experience a conflict of interest between the agency and the OIG who is criticizing it (Feldman and Eichenthal 2013).

Another important element that safeguards federal OIGs' independence is their reporting structure. The OIGs report their activities to their agency heads, but they also report to the Congress twice a year. This ensures that OIG activities are made public. If an agency is resistant to critical recommendations by the OIG, pressure can be brought to bear on the agency by Congress or the public. Further, relying on Congress for their authority and funding, inspectors general have considerable incentive to satisfy its demands as much as those of their executive branch agency heads or the president. Thus, the usual institutional rivalry between the branches provides a space for inspectors general to exercise an unusual degree of independence (Feldman 2017).

State and local OIGs are not created under a uniform statute. As a result, the levels of independence vary from jurisdiction to jurisdiction. In fact, some OIGs are not created under a statute at all but may be established by executive order or administrative fiat. The latter approaches mean that the OIG can be abolished without warning (Feldman and Eichenthal 2013).

Some state and local OIGs have less independence than their federal counterparts. For example, in Florida, a 1994 state law created a system of inspectors general in state agencies. While the Chief Inspector General reports to the governor, agency inspectors general report to and can be removed by individual agency heads. In New York City, the Commissioner of the Department of Investigation (DOI) is appointed by the Mayor, and the appointment of any agency Inspector General is subject to the approval of the DOI Commissioner. Agency inspectors general report to both the head of the agency that they oversee and to the DOI Commissioner. As both agency heads and the DOI Commissioner report only to the Mayor, New York City inspectors general do not enjoy interbranch "space" analogous to those of their federal counterparts, and thus in the Giuliani administration, for example, their work often appeared compromised by indirect mayoral control (Feldman and Eichenthal 2013). However, Section 801 of the New York City Charter requires a public explanation from any mayor who chooses to remove a DOI Commissioner and assures the Commissioner an opportunity to respond, thus potentially imposing a political cost should a mayor retaliate against unwelcome investigations (New York City Charter 2004). In this particular regard, the Charter does assure a measure of independence somewhat similar to that enjoyed by federal OIGs.

Some local and state OIGs, however, have more independence than the federal OIGs. For example, the New Orleans inspector general is appointed by the City Ethics Board, not the Mayor or City Council, and inspectors general serve a 4-year term and may only be removed from office by a two-thirds vote of the Ethics Board. The City Council could abolish the inspector general but only with a two-thirds vote (Feldman and Eichenthal 2013). Also, the OIG's budget is set as a percentage of the total budget of the City's General Fund and, therefore, not subject to the political appropriation process (New Orleans Office of Inspector General Annual Report 2017).

## Offices of Inspector General as Investigators and Auditors

Under the 1978 Act, federal OIGs are mandated to conduct independent, objective audits, investigations, and inspections. In fact, previously existing investigative units and internal audit offices were merged into new OIGs to work together in their oversight. Placing auditors and investigators in the same unit was one of the major innovations of the 1978 Act, which has important implications for OIG oversight. Auditing is a *pre-factum* activity, which means its goal is to prevent fraud, waste, and abuse before it happens. The audit function is intended to identify systemic flaws and vulnerabilities, whether or not any individual exploits those weaknesses or even if those weaknesses simply impede efficiency and

effectiveness. Audits that do identify such weaknesses also include recommendations for amelioration. On the other hand, investigating is a *post-factum* activity, focusing on identifying bad acts that have already occurred. The investigative function is intended to identify perpetrators who do exploit program weaknesses for their own gain (Feldman and Eichenthal 2013).

When working well, the two functions can be symbiotic: an investigation, likely based on suspicion arising from a "tip" or a "red flag" of some sort, after resulting in the identification and exposure of a perpetrator, can then lead to an audit that fully explains the systemic weakness allowing for the exploitation. In parallel fashion, an audit exposing systemic weaknesses may lead to an investigation identifying those who exploited the weakness. Other times, an inherent tension across these different roles arises in that investigations, which identify bad actors, often take precedent. In part, this is because investigations tend to reflect a "compliance monitoring" mind-set: they identify a target or targets who have failed to comply with the law or at least with ethical or professional standards. In contrast, audits more likely reflect a "performance monitoring" or "capacity-building" approach: they reveal that the agency does not have systems or resources in place that would allow efficient and effective pursuit of the agency's goals. As such, a high-profile criminal investigation may be more likely to generate the type of headlines and attention that win continued public and legislative support for the OIG than a systems audit. In addition, it is usually easier to develop an investigation that can lead to potential criminal charges or civil penalties than it is to win lasting reforms that would result from the adoption of an audit recommendation (id.)

The tension between audit and investigations and between compliance and performance places the OIG in a challenging position regarding the department or agency that it is monitoring. Ideally, the inspector general must attack the agency when it fails to meet legal, ethical, and professional standards, forthrightly condemning the agency's misbehavior in reports and testimony to the legislative branch, press, and public. At the same time, the inspector general must be able and willing to advocate for the agency, with equal force and effect, to a legislature and to a public hitherto unwilling to provide the agency with the tools it needs to achieve its mission. This balance is often very difficult to achieve while striving to maintain strict independence (id.)

Like the federal system of OIGs, state and local OIGs usually have to deal with a similar tension. However, not all state and local OIGs perform both audits and investigations. Some such offices perform only audits and some perform only investigations. If a state or local OIG does not have both responsibilities, it is more likely to investigate than to audit (id.)

## The Powers of Offices of Inspector General

The ability of OIGs to audit and investigate effectively is often dependent upon the tools that they have available to carry out their role. First and foremost, an OIG's power depends on the level of resources available to carry out its functions. Staffing and budget are important in defining both the type and number of investigations and audits that can be completed. OIGs with robust budget and staffing authority can take on complex investigations and audits that would be impossible for OIGs with more limited resources.

Nevertheless, OIGs budgets are usually only a very small percentage of the budgets of the agencies they oversee. For example, in Fiscal Year 2016, federal OIGs had a combined budget of approximately $2.7 billion and 13,000 employees (Council of the Inspectors General on Integrity and Efficiency 2017). Overall federal spending totaled $4.5 trillion (U.S. Department of the Treasury 2017), and there were approximately two million federal employees, not including federal contractors (Jennings and Nagel 2018). Thus, spending on federal OIGs amounted to 0.00006% of total federal spending.

Second, for OIG staff to draw conclusions about others' conduct, they must be able to access relevant information. For example, the ability of an inspector general to compel testimony and materials by subpoena can be a crucial tool in

the exercise of power. The ability to do so is dependent on the specific statutory authority vested in an inspector general.

For federal OIGs, the 1978 Act provides a variety of access tools. The agencies under their jurisdiction must provide any documents they seek, under threat of subpoena, and although the inspectors' general subpoena power does not extend to witnesses, agency personnel who refuse a request to testify surely bring further suspicion upon themselves. Some OIG personnel also are granted law enforcement power. These individuals are authorized to carry firearms, make arrests, and obtain and enforce warrants. Even though OIGs do not engage in criminal prosecution but must refer any criminal complaints to the Department of Justice, they often assist the Federal Bureau of Investigation in the investigation of fraud cases (Feldman and Eichenthal 2013).

The resources and authorities granted to the state and local inspector general function vary greatly and are generally far fewer than the resources devoted at the federal level. For Fiscal Year 2019, the New York State budget allocates $7.4 million to its inspector general, with a staff of 109 (New York State Division of Budget 2018): by comparison, the Georgia inspector general had a budget of about $700,000 (Georgia Office of the Inspector General 2016) and a staff of just 6 professionals (Georgia Inspector General web site undated). New York City provides more staff and more resources to its inspectors general than any other city: as of 2017, DOI had a budget of $54.8 million and a staff of 400 (Council of the City of New York 2017). By comparison, the Chicago OIG has a budget of about $8.6 million and a staff of 96 (City of Chicago 2017).

## Conclusion

OIGs monitor only. They can't make changes. They don't prosecute or participate in the management of the agencies they oversee. Thus, they are dependent on making a convincing argument for prosecutors, legislatures, agency heads, or the public to act on. Yet, the role and powers vested in OIGs give them a unique ability to both prevent and reduce government corruption and enhance government efficiency and effectiveness by identifying and shining a light on problems.

An individual OIG's effectiveness often depends on how it uses its powers and the degree of independence it has. Some OIGs focus on generating headlines at the cost of achieving real change. Other OIGs lack adequate independence or are lured into passivity. But an OIG who is able to avoid becoming a "headline hunter" or a "lapdog" has the position and the power to effect valuable and significant change.

OIGs' monitoring can deter those who seek to abuse power or defraud taxpayers. They can work to ensure that taxpayer dollars are invested in a way that achieves important outcomes, from basic local service delivery to ensuring national security. Ultimately, they can become both a bulwark against corruption and a force for better government. They have already become an important institution in the pursuit of government accountability.

# Ombudsmanship

Mehmet Zahid Sobaci and Ibrahim Hatipoğlu
Uludag University, Bursa, Turkey

## Synonyms

Conciliator; Moderator; Negotiator

## Definition

Ombudsman is an independent public institution, generally established by parliaments, to supervise the administrative activities by acting upon complaints received from citizens or ex officio.

## Introduction

Protecting human rights and eliminating maladministration are one of the essential functions of democratic governments. Ombudsman is an institution established to contribute the fulfillment of these functions by democratic government and has spread around the world at national, state, and local level. Increased sensitivity for human

rights, challenges and problems experienced in the judicial area, expansion of public administration, and rising values such as transparency, accountability, and participation in public administration have an impact on the spread of the ombudsman idea. Today only few countries have not adopted the ombudsman institution. Across the world today, there are a total of 945 ombudsman institutions in 140 different countries in 6 continents (Ayeni 2014).

Ombudsman receives, investigates, and resolves the complaints of citizens about actions or inactions of public administration. In addition to parliamentary control and judicial review, ombudsman is a control mechanism on public administration. Ombudsman is not a judicial body and cannot replace it. Ombudsman plays a complementary role to judicial organs.

The basic aim of ombudsman institution is to improve the functioning of public administration and to contribute to the construction of good governance. Therefore, ombudsman institution serves for the improvement of democratic standards in a country. In this context, ombudsman institution is expected to strengthen transparency and accountability in public administration, contribute to the process of citizen education, encourage citizen participation, transform the relationships between public administration and citizens, and increase confidence in public institutions.

## Historical Development of Ombudsman

There are some views that institutions or officials similar to the modern ombudsman have been seen in the Roman, Chinese, Islamic, and Spanish systems throughout history (Reif 2004). However, the origins of the ombudsman institution are found in Sweden. The king of Sweden, Charles XII, took refuge in the Ottoman Empire after a military defeat by the Russia in 1709. In this period, the king established an office to monitor the conduct of Swedish administration on his behalf in 1713. The emergence process of modern ombudsman started with the establishment of this office. The first modern ombudsman institution was established in Sweden in 1809 (Stern 2008).

After Sweden, ombudsman institution was established in Finland (1919), followed by the one established in Norway (1952), then in Denmark (1955) and West Germany (1956). As is clearly seen, ombudsman existed as an institution unique in Northern European countries until 1960s. In the beginning of 1960s, Commonwealth countries adopted the ombudsman idea. This institution was firstly created in New Zealand in 1962 (Rowat 1964). The collapse of totalitarian regimes in such countries as Portugal, Spain and Greece, and the process of democratization in the Central and Eastern European countries after the Cold War have an impact on the spread of ombudsman model to this region. As part of the recent democratization movements, the ombudsman institution was established in these countries (Kucsko-Stadlmayer 2008a).

One of the most important reasons underlying the spread of ombudsman in 1950s is that the idea of welfare state gripped the whole world. As a result of the idea of welfare state, the public administration mechanisms have overgrown and the issue of protecting citizens' rights against the public administration has come into prominence. The fact that ombudsman is readily accessible to the citizens, free of charge, and relatively fast in comparison to the judicial system played a role in the adoption of this institution by the countries (Rowat 1964). In fact, the ombudsman institutions are considered a valuable alternative for situations where judicial proceedings are unavailable or unrealistic (Reif 2004). In addition, the fact that the ombudsman institution has flexibility and is therefore adaptable countries with different political and administrative cultures facilitated the spread of the institution (Cheng 1968).

## Ombudsman: Essential Characteristics

Ombudsman "means only that a citizen aggrieved by an official's action or inaction should be able to state his grievance to an influential functionary, empowered to investigate and to express conclusions" (Gellhorn 1967: 93). Ombudsman institutions have been incorporated into different national context. Therefore, ombudsman institutions may

possess different organizational structures and functions within the context of political and administrative culture of the countries. However, it is possible to talk about some defining characteristics in relation to ombudsman institution. According to Hill (1974: 1077), "ombudsman is (1) legally established, (2) functionally autonomous, (3) external to the administration, (4) operationally independent of both the legislature and the executive, (5) specialist, (6) expert, (7) nonpartisan, (8) normatively universalistic, (9) client-centered but not anti-administration, and (10) both popularly accessible and visible."

The naming of the institution, its status, duties and powers, jurisdiction, and complaint handling procedure may differ from country to country. Countries such as Norway, Netherlands, Australia, New Zealand, Ireland, Canada, and Malta use the original name of the institution. Ombudsman institution is referred to as "Parliamentary Commissioner for Administration" in United Kingdom and Sri Lanka; as "Mediator of the Republic" in Francophone countries such as France, Senegal, and Burkina Faso; and as "Defender of People" in Spain, Argentina, Peru, and Bolivia where human rights ombudsman exists (Reif 2004).

While ombudsman institution is constitutionally embodied in such countries as Sweden, Norway, Spain, and the Netherlands, it has been established by a law adopted by the parliament in some countries such as France, Belgium, and United Kingdom. In Kazakhstan, on the other hand, it has been established, unlike those in other countries, by a decree (Kucsko-Stadlmayer 2008b).

Ombudsman institution is regularly granted more or less close organizational relations to parliament to ensure independence from the executive branch (Kucsko-Stadlmayer 2008a). Moreover, ombudsman is appointed, in general, by the parliament and removed by the parliament as well. However, ombudsman is appointed by the executive branch in United Kingdom (Queen), France (Council of Ministers), and Kazakhstan (State President). Exceptionally, it may be removed by the judicial organ in France and by the president in Kazakhstan and Uzbekistan. In Austria, on the other hand, the ombudsman cannot be removed from office before completion of his/her period of office. In many countries across the world, the ombudsman can be reappointed. While there is no limitation regarding the reappointment of the ombudsman in such countries as Sweden, Norway, and Finland, the ombudsman may be appointed one more time in such countries as Russia, Portugal, and Ireland. It is not possible for the ombudsman to be reappointed in France, Israel, and Azerbaijan (Kucsko-Stadlmayer 2008b).

Classical mandate of the ombudsman is to investigate the complaints of citizens against executive branch by acting upon a complaint or ex officio. However, in recent years, new mandates have been given to the ombudsman across the world. Therefore, hybrid ombudsman institutions have emerged. In addition to investigating the complaints, hybrid ombudsman institutions are also given new roles such as protecting human rights, fighting corruption, preventing the elected and senior public officials from abusing their powers, eliminating interest conflict, and preventing nepotism. Hybrid ombudsmen are found especially in Latin America, Caribbean Region, Asia, and Africa (Reif 2004).

The jurisdictions (scope of control) of Ombudsmen differ from country to country. The jurisdictions of ombudsmen are generally shaped up by the political and administrative traditions of countries. For instance, central government and local governments, the army, and judicial organs in Sweden are under the control of Swedish ombudsman (Capozzola 1968). However, the local governments, the decisions of the council of ministers, judicial decisions, and the works of auditors are outside the jurisdiction of ombudsman in Norway (Gellhorn 1967). Ombudsmen have, in general, authority to investigate, ask for the relevant documents, listening to the people, and releasing the decisions or reports to the public and relevant public institutions. However, the ombudsmen do not have the power to impose sanctions on public institutions. Therefore, the ombudsman is seen as a watchdog (Letowska 1990). Ombudsman institution is not a judicial organ.

In general, no stipulation and fee is required to submit the complaints to the ombudsman. Citizens are able to communicate their complaints directly to the ombudsman. However, in some countries such as United Kingdom and France, a complaint cannot be directly filed to ombudsman, and citizens need the mediation of a senator or MP to communicate their complaints to the ombudsman (Kucsko-Stadlmayer 2008b). With the exception of such countries as United Kingdom, Belgium, and Luxemburg, the ombudsmen have, in general, authority to act ex officio for investigation of complaints (Kucsko-Stadlmayer 2008b).

## Categories of Ombudsman

Gregory and Giddings (2000) argue that ombudsman institution today can be classified under five groups:

*General Purpose Ombudsman*: These ombudsmen are public sector offices receiving the complaints related to all the actions and activities of public institutions, regardless of the level of government and field of public service. Today, in most of the democratic countries, there are general-purpose ombudsmen at the national or subnational level.

*Single Purpose Ombudsman*: These ombudsmen monitor a particular policy area or are responsible for the protection of the interests of a specific group. The jurisdiction of these ombudsmen is confined to a particular field such as environment, health, prisons, and armed forces or the complaints of a specific group such as the disabled, children, and ethnic minorities. For instance, while there are military ombudsmen in such countries as Sweden, Norway, and Germany, there is a police ombudsman in such countries as Canada, United Kingdom, and Northern Ireland. Moreover, there are ombudsmen for data protection in Canada, Hungary, and Germany and for ethnic minorities and children in Sweden.

*International or Supranational Ombudsman*: Today, international organizations such as United Nations, World Bank, International Monetary Fund, and World Health Organization make use of ombudsman institution. The jurisdictions of these ombudsmen are confined to staff complaints in international organizations. The best example of a supranational ombudsman is the European Ombudsman.

*Human Rights Ombudsman*: This ombudsman also called as hybrid ombudsman institutions has been getting more important and spreading across the world. The jurisdictions of these ombudsmen, in addition to the conventional eliminating maladministration mandate, include the protecting human rights as well.

*Private Sector Ombudsman*: The private sector ombudsman that is spreading rapidly in such sectors as banking, pensions, insurance, and investment deals with the complaints of customers.

## Success Factors for a Powerful Ombudsman

Ombudsman is a flexible and dynamic institution. Many countries across the world have established the ombudsman institution at different levels of government (national, state, regional, and local), for different social groups (such as disabled, children, women and minorities) and in different sectors (such as universities, media, and healthcare services). However, it is difficult to say that the ombudsman institution is very powerful and functions successfully in every country. For a powerful ombudsman, some requirements have to be met.

*Maintaining Independence*: The independence of ombudsman institution has to do with to what extent the institution is away from institutions it investigates and the interventions of legislative, executive, and judicial branch. According to Gottehrer and Hostina (2000), in order to maintain the independence:

- Ombudsman institution should be guaranteed by the constitution and laws.
- Ombudsman should be appointed by the parliament via supermajority, but it should be free from the functional control of the parliament.

- The ombudsman should have a long and fixed term of office.
- There should be specific reasons of dismissal in order to guarantee not to be removed for political reasons.
- The ombudsman should have a high and fixed salary and sufficient human and financial resources.

*Maintaining Neutrality and Respectability of Ombudsman*: In order for ombudsman to be successful, citizens should believe that their complaints to the ombudsman produce a result and in parallel, the relevant public institution should believe that the investigation is neutrally carried out by the ombudsman. This belief has to do with maintaining the respectability of the ombudsman. In this context, the person appointed as an ombudsman should have deep knowledge and experience regarding the world of public administration. Ombudsman should be banned from the political activities. Ombudsman should be noted for its integrity.

*High Standard of Democracy*: In a country where the principles and values of democracy have been internalized and the citizens have awareness of active citizenship, ombudsman institution can be more successful. In a patrimonial state that consecrates the state over the individuals and views the public only as a mass to be governed, it is not easy for the ombudsman institution to be successful.

*Media Support*: Since the ombudsman is not authorized to take binding decisions and impose sanctions, the most important power available to the ombudsman is to release the reports to the public, thus, to create pressure on the public institution investigated by ombudsman. Therefore, the ombudsman needs a powerful media support. The media may help the ombudsman institution to create public opinion about the institutions that have been unfair to the citizens, focus the attention on the relevant issue, and therefore, correct their mistakes.

*Recognition of the Ombudsman Institution*: Citizens should have high awareness of the ombudsman institution and the institution should be accessible. If citizens are unable to take advantage of this institution, existence of the ombudsman will not make any sense. Therefore, the citizens should be informed regarding the ombudsman institution and the complaint procedures; the ombudsman should be accessible for the citizens and if need be, regional or local units should be established; its services should be free of charge and awareness of this institution should be increased through promotional activities.

## Ombudsman and ICTs

The strength and effectiveness of ombudsman and achieving of its mission depend on high level of the institution's visibility and reliability, accessibility of the institution, high level of prestige of the institution and its staff, and collaborative interaction between ombudsman and governmental and social actors (Ayeni 2000). Today, public institutions use information and communication technologies in order to provide effective and efficient services and communicate with their stakeholders. The ombudsman institution highlighted by the features such as accessibility, being close to the public and free of charge to complain, is one of the institutions that need to benefit from the opportunities offered by the information and communication technologies. It can be specified that ombudsmen have a certain kind of awareness regarding these opportunities. In fact, the ombudsmen across the world established websites to promote themselves and get in touch with the citizens; they have implemented e-application systems by which citizens can submit their complaints online; and they have set up Ombudsman TV and adopted the technological developments.

However, the recent technological developments offer new opportunities and channels for the public institutions. Social media tools, as of today, reflect the latest development in the field of Internet. Ombudsmen may utilize the social media tools to introduce themselves to the public; inform the public about their decisions, investigations, and conflicts they have reconciliated; encourage citizen participation; promote the citizens for

consultation and complaints; and improve the relationships with the stakeholder. For instance, by uploading promotion videos, educational videos, press conferences, and speeches, video sharing sites such as YouTube may be used to promote the institution and inform the public. A microblog like Twitter can be a new channel for the ombudsman to disseminate the information regarding its decisions and activities to thousands of people with few tweets and communicate with the public. The ombudsman can answer the citizens' questions via Twitter. Facebook as a social network can be a tool to announce a press conference and a completed report of the ombudsman and improve the relations with the media. Ombudsmen can benefit from the professional networks such as LinkedIn in the recruitment of personnel (Sobaci and Köseoğlu 2016).

## Conclusion

Today, the establishment of an ombudsman institution is an investment in good governance in a country. Ombudsman institutions have potential to contribute to transparency and accountability in public administration mechanisms. Therefore, ombudsman institutions have been adopted by a large number of countries around the world. However, duties and powers of ombudsman institutions, their jurisdictions, and complaint handling procedure differ from country to country.

There are emerging issues regarding ombudsman institutions. One of the recent developments regarding the ombudsman is to develop international standards for these institutions. The emergence of national human rights institutions as a result of increased awareness of human rights and the spread of the ombudsman institution across the world have paved way for the efforts aimed at specifying the international standards regarding the structures and duties of these institutions. Some international organizations play an important role in this process.

Another emerging issue regarding ombudsman is the evaluation of ombudsman's effectiveness. In recent times, a trend has emerged to analyze the effectiveness of ombudsmen in different countries. Such an effectiveness analysis is necessary for the ombudsman institution. As stated earlier, the establishment of ombudsman institution in a country alone does not guarantee its successful operation. In that case, it is necessary to analyze whether the institution functions effectively and has materialized its reasons of existence (raison d'être).

# One-Step-Shop in Service Delivery in Kenya

Gedion Onyango
Department of Political Science and Public Administration, University of Nairobi, Nairobi, Kenya

## Synonyms

Customer-centered service delivery; E-government; Integrated service delivery; One-stop government; Single-window service delivery

## Definition

One-stop-shop model involves integration or amalgamation of related public services to someway render these services seem seamless to service seekers.

## Introduction

Contemporary public organizations have increasingly become expressive and complex. This mainly arises from, among others, the pursuit of similarly complex reform approaches in efforts to stay in contact with their environments and in the attempts to ensure control, foster efficiency, coordination, legality, and legitimacy (cf. Christensen and Lægreid 2011; Meyer and Rowan 1977). The adoption of one-stop-shop model should therefore be seen as one of such organizational forms pursued by modern government to respond to the complex needs or interests, environments, and goals faced by public organizations. Indeed, there is a particular global trend with modern governments establishing one-stop-shop model in the pursuit of efficient, accessible, coordinated, and seamless cost-effective public service delivery mechanisms in public organizations. However, despite becoming popular with service delivery across the globe, one-stop-shop model is actually still underdeveloped as a concept in public administration (Askim et al. 2011). For example, there is confusion whether one-stop-shop and e-governance should be considered as separate models or one in the same. This essay even so aligns toward the latter conceptualization. Similarly, there is some degree of knowledge gap regarding essential successes and barriers drawing on the fact that one-stop-shop models are still a few in numbers (Hagen and Kubicek 2000).

This essay accordingly interrogates implications of one-stop-shop model for organizational environments, i.e., technical and institutional of public organizations as far as service delivery and needed institutional changes are concerned (cf. Meyer and Rowan 1977). The technical organizational environments concern issues of productivity, exchange, and efficiency of the bureaucracy, which often arise from environmental pressure amounted on the organizations to perform. Conversely, institutional environment has a little to do with instrumental characters of the bureaucracy and more to do with assumptions on the appropriate bureaucratic design, administrative culture, recruitment policy, and demography, among others (cf. Christensen and Lægreid 2011). Altogether, these environmental aspects should improve organizational legitimacy.

Actually, in public policy the one-stop-shop model largely stems from concerns with organizational environments regarding the performance of public organizations insofar as service delivery is concerned. Even so, just like any other de-bureaucratization efforts, its functionality may

be informed by a complex interaction of other variables falling within instrumental, cultural, and environmental dimensions of public organizations.

That said, in this essay the feasibility of one-stop-shop model in ensuring effective service delivery in public organizations within intergovernmental governance structures is explored. In particular, the data draws mainly on interviews with county government administrators and executives, as well as with the staff of oversight institutions in Kenya's Kisumu, Migori, and Nairobi counties. These interviews were conducted in the period between January 2015 and May 2016. The qualitative analysis of these findings indeed illuminates the functionality of one-stop-shop, especially success and possible barriers faced by the model in situations where the bureaucracy has been established to largely suffer from administrative ills and constrains such as shirking, lethargy, red tape, nepotism, and corruption.

In so doing, the essay explores:

(a) Whether the feasibility of one-stop-shop model has a correlation to a change of administrative culture toward service delivery and organizational design or whether it merely entails dimensions of organizational hypocrisy as administrative symbols
(b) Whether one-stop-shop model reduces complexity and improves coordination of service delivery in devolved public organizations or whether it is simply utilized as a front desk by public entities
(c) Whether one-stop-shop can remedy accountability ills common in public organizations or it simply avails accessibility to public services less prone to corruption

These areas will be generally dealt with in the course of discussion in the case of one-stop-shop model in Kenya.

## Overview of One-Stop-Shop Model in Kenya

The one-stop-shop model may generally range from "frontlines of complex singular agencies to umbrella structures for several agencies" (Askim et al. 2011: 1452), to integrated technological platforms granting access to a number of governmental agencies and services, and to a wholly integrated and physically colocated services within one building or on one floor to ensure a single point of access. In short, one-stop-shop model features isomorphic characteristics of customer service model known for business organizations, which include physical locations, Internet or web-oriented services, service center kiosks spread to various locations, and call centers (cf. Bent et al. 1999). In this way, accessibility to public services shifts from the traditionally predominant face-to-face service delivery to other devices such as mobile phones or fax and the Internet. One-stop-shop as organizational model should essentially broaden reachability or the contact between governmental institutions with citizens to increase efficiency and productivity so that service delivery can be offered in one contact.

In Kenya, one-stop-shop model (or *Huduma* center) was launched in November 2013 following coming to power of the Jubilee government. It began with access to a few services, which expanded over time, including the spread of kiosks across the country. Indeed, the government has thus far established 45 one-stop-shop kiosks in many counties across the country. *Huduma* centers are mandated to deliver governmental services from "a single location, online e-Huduma web and mobile portal to provide integrated services offered by various government ministries, departments and agencies and a unified and integrated channel Huduma payment gateway to facilitate ease of payment for government services" (Huduma Kenya, http://www.hudumakenya.go.ke/).

The services offered include the issuance of national identity cards and birth certificates, applications of business licenses and registration of business names, issuance of police abstracts, and application or renewal of drivers' licenses, among others. This is nevertheless insufficient or unevenly distributed across 47 counties. The model is coordinated by the Ministry of Public Service Youth and Gender Affairs through the *Huduma* Secretariat. In addition, different

agencies, particularly Kenya Power and Lighting Company (KPLC), Kisumu Water and Sewerage Company Limited, Kenya Revenue Authority (KRA), and Anti-Corruption Agency (ACA), have established notable online and phone-oriented services somehow independent of the one-stop-shop's online platform.

### The Influence of One-Stop-Shop Model on Bureaucratic Design and Culture

Findings from the studied counties indicate that one-stop-shop kiosks in Kenya have actually improved the *technical environments* of public organizations. This is especially in terms of public service delivery in Ministries, Departments and Agencies (MDAs). Therefore, one-stop-shop has somehow improved efficiency, coordination, and productivity by reducing the red tape in service delivery. Indeed, the red tape and poor coordination of service delivery mechanisms have often been cited as key in the underperformance of MDAs in the country. They have been similarly correlated to the prevalence of corrupt practices in public organizations.

By addressing such technical dimensions of public organizations, one-stop-shop model fosters citizen's accessibility to some essential public services. Indeed, despite being drawn from their respective line ministries or departments, bureaucrats at one-stop-shop service centers portray attitudes of commitment, service-mindedness, and professional identities commonly characterized with service delivery in the private sector. This was reportedly in contrary to experiences with service delivery in MDAs. It was particularly stated that *know-whom attitude or informal networks* hitherto predominant in the accessibility of public services were fading with adoption of one-stop-shops model in service delivery across the country. This may explain why one-stop-shop initiative in Kenya was awarded the *United Nations Award in 2015* under *Improving the Delivery of Public Services* category.

Indeed, such a positive development proves important for the discourse on policy reforms and functionality of public institutions in sub-Saharan Africa. That is, the literature on administrative reforms in the subcontinent has often overlooked gains made by such internal initiatives as one-stop-shops in the pursuit of bureaucratic changes. Instead, there is often an obnubilating emphasis on redundancy or path-dependent related implications for bureaucratic reforms. In this way, the case of one-stop-shop in Kenya can partly demonstrate that despite unfavorable conditions for bureaucratic reforms such as New Public Management (NPM) in the region, there are also success stories (cf. Grindle 1997). As a policy implication, therefore, one-stop-shop model shows that reformers in such contexts "need to keep an open mind as to what may work and what may not, and to be guided by the needs of the situation" (Polidano 1999: 2–3). It is actually upon such needs across the globe that one-stop-shop model has often been founded by modern governments in response to demands by citizens and pressure on politicians to create effective and efficient service delivery mechanisms (cf. Hagen and Kubicek 2000).

Nevertheless, one-stop-shop hardly resolves key administrative problems relating to service delivery. In the Kenyan case, for example, the model has remained more of the urban experience than it is in the rural settings. That is, one-stop-shop kiosks or its online platforms hardly cover the larger population in the country residing in the rural settings. It was established that one-stop-shop kiosks are instead largely based in some key towns or county headquarters and are similarly not available in all counties. As such, service seekers outside the proximity of these towns are either forced to travel to urban centers to access services or are served by the mainstream MDAs in areas without service centers. This means that one-stop-shop model is characterized by demand for resources and other infrastructures, which may pose both the short- and long-term challenges for governments pursuing such changes. This includes ensuring accessibility to affordable connectivity to the Internet and other urban-related physical infrastructures. These are relatively still a challenge in most rural settings in Kenya.

As a consequence, it can be assumed that the larger part of the public service in the country remains characterized by inefficiency, corruption, shirking, and lethargy. These have often been

established to negatively impact on accessibility and efficiency to service delivery in the country. However, county administration has reportedly substantively reduced shirking by bureaucrats because of the closer supervision and changed dimensions of administration. The county governance factor correlates or explains the increased establishment of one-stop-shop kiosks across the country. Secondly, the e-citizen platform is hardly accessible to majority of service seekers drawing on inaccessibility of ICT services arising from the lack of financial resources and ICT skills.

The consequence is inconsistency and decreased public service uptake by majority of potential service seekers residing in rural areas with little access to one-stop-shop kiosks. This indeed correlates to the persistent disconnect between the state or the government and the society creating governance gap. This gap can also be used by many commentators to explain path-dependent roles of parochial cultural dimensions like kinship or tribalism, which have characterized political-administrative structures and the culture of service delivery in Kenya since independence. In other words, citizens tend to conceive the government based not on effective public services delivery, but on issues of demographic identities and their perceived representativeness in the composition of the government or administration. This implies that the legitimacy or trust in government by the rural population cannot be entirely evaluated basing on the effectiveness of public service delivery (cf. Brinkerhoff et al. 2017).

More research may therefore be needed to interrogate why governments, where majority of the population resides in rural settings, still pursue internal initiatives to improve service delivery mechanisms like one-stop-shop. More particularly, given the relatively less environmental pressure arising from such contexts, in the case of Kenya, the pursuit of one-stop-shop model may arise from the combination of:

(a) The assumption of office and forming the new political leadership by the Jubilee government
(b) The high rate of urbanization across the country and the subsequent lifestyle, which comes with the demand for convenience, including, in the public service delivery
(c) Implementation of devolution that has brought governance structures closer to the citizens and which has created pressure for the local governments to deliver
(d) The mimetic tendencies of modern governments to pursue similar administrative symbols or reform myths in addressing somehow similar governance problems

Nevertheless, both the central and county governments in Kenya still need to conduct intensive public sensitization on how one-stop-shop model operates. This is because the majority of citizens were reportedly not fully knowledgeable of one-stop-shops, in particular as pertains to the electronic platforms of the one-stop-shop. For instance, in most cases majority of service seekers to KRA counters were referred to seek their services online in different one-stop-shops visited.

Moreover, one-stop-shops in Kenya witness inadequate number of public officials in some counties to provide public services. That is, as was reported in Kisumu County, heads of department are neither committed to assigning their staff to serve in the one-stop-shop kiosks nor are the majority of bureaucrats interested in working at these centers. More so, if there are no allowances accruing for serving at the centers, the consequence is inaccessibility to essential governmental services or delay thereof.

Relatedly, some MDAs tend to use these service centers as mere queue management points or prescriptive counters for service delivery. That is, some MDAs hardly offer substantive service delivery at the one-stop-shop kiosks at one go, which may lead to delay if the user fails to follow up at the main office. For example, besides the allocation of a service number, issuance of birth certificates can only be offered in the main offices taking on the normal bureaucratic procedures. Reportedly, this may come with extortion, bribery, or delays. The same applies to other services such as those offered by authorities like the National Transport Authority and Kenya Revenue Authority. Indeed, to this extent, adoption of service

delivery centers has done little toward changing perceptions, attitudes, and beliefs of bureaucrats or how the latter relate with the bureaucracy. However, this may also partly stem from either the technicality or the sensitivity involved in the delivery of some services. In particular, services offered by institutions of accountability such as ACA or the ombudsman, for example, those dealing with issues of administrative wrongdoing, can hardly be handled at the service centers.

In addition, some bureaucrats placed at these service centers were reported to have inadequate knowledge of the processes involved in accessing some services offered by their departments. This arises both from problems with institutional recruitment policies, which are often characterized by parochialism ideologies rather than on merit. This may as well as stem from the rank and level of experience of concerned bureaucrats. In other words, besides some junior officers, more experienced and knowledgeable or senior bureaucrats hardly serve at the one-stop-shops. Thus, service seekers may be referred to the main offices to be served.

Moreover, despite the gains made by adoption of one-stop-shop in Kenya, exceptions were still reported regarding corruption-prone services, e.g., application of driving or business operation licenses for car inspection certificates offered by regulatory authorities and security agencies. Therefore, more research is needed to verify whether one-stop-shop model can substantively reduce spiral opportunities for corruption in settings like Kenya where patronage and other socio-economic structures have perennially influenced the pursuit of institutional change and informed organizational behavior in public organizations. That is, does one-stop-shop model avail adequate institutional change or change of bureaucratic culture that is likely to facilitate or reduce corrupt practices in public organizations? And can de-bureaucratization and/or bureaucratic efficiency equals to less bureaucratic malpractices? There are however high chances that one-stop-shop model may reduce cases of maladministration, which are particularly stemming from issues of ineffective coordination and red tape with regard to service delivery. Concerns with accountability will be briefly illuminated as follows.

### The One-Stop-Shop Model and Bureaucratic Accountability Problems

Many studies across the globe on one-stop-shop have credited the model for increased efficiency in public service delivery through enhanced accessibility and coordination (cf. e.g., Askim et al. 2011). Indeed, inasmuch as one-stop-shop in Kenya does not explicitly form accountability or even policy reforms to this end, the model has to a minimal degree reduced cases of extortion and bribery in MDAs. This has been particularly through the elimination of personal contact or *know who* (either in forms of a broker or a relative), which to service seekers has always been essential to get quick services or to attain reliable services within the needed time frame (cf. Onyango 2012). As such, there were reportedly reduced efforts to have personal contacts with bureaucrats in MDAs. Indeed, public services such as application for identity cards and other related documents, business names and police abstracts, which have often been associated with extortions and bribery, have become easily accessible to users. The one-stop-shop has therefore reduced contacts between bureaucrats and service seekers subsequently reducing chances for corrupt transactions in MDAs. In short, the discretionary powers, the shift in information asymmetry on public service delivery, and authority hitherto abused by corrupt bureaucrats has been substantively reduced or eliminated altogether.

However, there were similarly reported exceptions. For example, one-stop-shops have hardly addressed accountability problems arising from *institutional environments* of MDAs. That is, recruitment processes, internal culture, and questions of organizational identity have been hardly touched. On top of this, it was established that one-stop-shop kiosks outside Nairobi County have not been effective in attracting potential complainants against administrative wrongdoing or injustice. The counters allocated to ACA and the ombudsman at Kisumu and Migori counties'

one-stop-shops were rarely operational. Part of this was reportedly based on the fact these institutions do not have adequate staff to serve at the service centers in some days. Secondly, potential complainants of administrative wrongdoing did not feel comfortable with making reports of this nature at the one-stop-shop kiosks. In fact, probably basing on the absence of adequate activity, ACA's counter in Kisumu service center was accordingly reallocated to KRA. At the same time, however, rare operations by oversight institutions in one-stop-shop kiosks can as well be used to interrogate the extent to which external environments assert pressure on the government in dealing with corruption and other forms of maladministration in the public sector.

In addition, even though application for government procurement opportunities has been made easier through one-stop-shop, the procurement process is reportedly still characterized by incidences of kickbacks to bureaucrats who influence the awarding of government tenders. The commission phenomenon – i.e., the (10%) kickback of the tender value – common in MDAs has not been affected by the adoption of one-stop-shop. That said, the political-administrative corrupt cartels said to dominate bureaucratic financial structures in the country are seemingly untouched by the operations of one-stop shop. It was indeed established that structures of decision-making and management with regard to service delivery have hardly changed despite adoption of one-stop-shop.

Further to this, it was reportedly stated that some of the call centers were hardly reliable. KPLC calling center was particularly described as a mere public relations stance as they hardly get back to their customers, or they often delay if they decide to get back. This is so despite the agency of the complaint. Indeed, the concern with responsiveness of call centers affected many agencies, including KRA and ACA. Some respondents in Kisumu and Nairobi also alluded that KPLC's prepaid service payment system, often done through mobile money services, tends to be compromised from within. They are also generally unreliable and often tampered with by even the users themselves. That is, there are concerns with accountability as it is hardly trusted by majority of consumers. In fact, there were perceptions by those interviewed implying the existence of possible manipulation of the payment systems in generating illegal revenues for some individuals within KPLC. This may also explain concerns by KPLC on the accuracy or transparency of prepaid payment services back in 2014.

As such, insofar as service centers tend to improve aspects of technical environment of public organizations, dimensions of institutional environment, which are also essential for effective bureaucratic oversight, are rarely affected. Indeed, dimensions such as perceptions of bureaucratic and demographic representativeness in MDAs or concerns with organizational identity, interorganizational trust, organizational communication, and commitment are shadowy factors, which may affect implementation of such administrative initiatives. Studies indicate that such institutional environments can hardly be addressed through de-bureaucratization efforts as one-stop-shop model. In consequence, one-stop-shop model may be described more as some of those administrative changes pursued by political-administrative executives to improve performance rather than to change organizational values, which are often hard to come by (cf. Brunsson 2006).

Similarly, such concerns with dimensions of institutional environments of the bureaucracy indicate that even though external organizational environments may be important drivers for bureaucratic changes in regard to improving efficiency, a focus on organizational members is indeed important. In particular, the latter is very essential as far as institutionalization and internalization of administrative reforms or implementation of one-stop-shop model is concerned. It defines, for example, bureaucratic capacity, accessibility, sustainability, and even development of particular institutional changes in countering both anticipated and unexpected outcomes.

Therefore, the complexity of institutional environments may explain the wicked problems of accountability reforms such as bureaucratic corruption that has been a common phenomenon in

Kenyan public organizations since independence. Indeed, this path-dependent explanation matters as far as perceptions toward the effectiveness and sustainability of one-stop-shop model in public organizations and its analysis thereof are concerned. In particular, the short-term barriers to one-stop-shop on service delivery may arise from *problematics of attention* or details of definition of programs (March and Olson 1983). That is, one-stop-shop as a de-bureaucratization initiative should similarly involve "formulating clear intentions and in explaining how to organize the implementation of those intentions, co-ordinate the reforms, etc." (Christensen and Lægreid 2003: 21). This is also because one-shop-model can hardly be delinked from reform realities as they are embedded onto broad public sector reform programs and designs, including the general efforts of reorganizing county administration and the implementation of accountability reforms in public entities.

In Kenya, for example, one-stop-shop is explicitly situated as a flagship project for achieving *Vision 2030*, instituted under the Mid-Term Plan for 2013–2017. The *Vision 2030* entails series of reforms including devolution. Indeed, studies on one-stop-shop model in the country fail to recognize that one-stop-shop model may not be sustainable if not balanced with other more sector-oriented policy areas (cf. Christensen and Lægreid 2003). Instead, there is a tendency by both the Kenyan government to conceive one-stop-shop model as detached from bureaucratic structures and culture, where it is actually deeply embedded upon.

Accordingly, there is a tendency to focus more on how current structures of service delivery or approach to issues of maladministration have addressed the past problems than on whether these structures are immune from structural problems of the bureaucracy. Additionally, one-stop-shops are conceptualized in a manner, which tends to detach it from realities faced in public organizations such as concerns with resources, capacity and skills, or motivation of bureaucrats. The consequence of this may be obnubilation of a focus on the dynamism of new structures including inherent barriers, as well as the resiliency of past structures and culture in as far as issues of organizational performance in public organizations are concerned.

For example, the fact that counters of ACA and the ombudsman at the service kiosks in some counties were rarely operational may indicate concerns with inadequate institutional environments in terms of staff capacity, culture, and limited resources. Similarly, this may indicate the nature of the relationship between accountability institutions and the society or the extent to which the latter are knowledgeable about the responsibilities of the former. These have been particularly some of the key challenges for anti-corruption efforts in Kenya from the 1990s.

To this extent, it can be argued that the pursuit of one-stop-shop in Kenya in fostering efficient service delivery features some levels of organizational inconsistencies between the idea and accountability norms or actions in some individual agencies or by bureaucrats (cf. Brunsson 1993). That is, some MDAs in the bid to comply with this kind of collective organizational action have presented inconsistent and hypocritical responses to concerns with efficiency, transparency, and accessibility while at the same time cooperating with the implementation of one-stop-shop.

The procurement processes, for example, emphasize accessibility and efficiency and, on one hand, while on the other, reflect hypocrisy or problematic compliance with issues of accountability and transparency. As such, there are inconsistent organizational characteristics in terms of accountability norms, processes, and structure, more especially, when it comes to assumptions of service seekers and ideas presented by MDAs concerning efficiency of one-stop-shops, on one hand, and actions of administrative executives in pursuing those ideas, on the other. Therefore, as far as accountability implications are concerned, there is an inherent gap between values and structures with regard to institutionalization or implementation of one-stop-shop model in Kenya. The solution lies with interrogation of the general and specific policy implementation problems and how these can impact on the effectiveness and sustainability of one-stop-shops in the country.

## Conclusion

Discussions advanced above demonstrate that one-stop-shop as an organizational form should be seen more as a reform myth than administrative reforms in themselves. This draws on their less ideological inclination and incremental implications with regard to service delivery in public organizations. This is in addition to the fact the model is only but part of comprehensive administrative reforms in the public sector, because, as a reform symbol, one-stop-shop model stems from the pressure and efforts by public organizations to foster contact with their environments through technology and in a cost-effective manner. As such, one-stop-shop in Kenya illustrates the mimetic tendency of modern governments to implement initiatives, often mythicized to address particular administrative challenges such as red tape, wicked policy problems, or concerns with coordination in public organizations. Indeed, one-stop-shop model in Kenya has increased accessibility and efficiency, as well as some levels of accountability in this regard. Common cases of bribery, shirking, and extortion, which previously characterized Kenyan public organizations, have been substantively reduced through limited implications for the face-to-face service delivery or contact between bureaucrats and service seekers.

Nevertheless, there are still some path-dependent related challenges to accountability aspects in public organizations arising from institutional environment and other instrumental-cultural related factors. These may as well affect the functionality of one-stop-shop model in the long run, especially, if they become more prevalent or resistant to instrumental bureaucratic changes. Therefore, one-stop-shop, like any other form of institutional change, must be structurally supported to remain sustainable.

Indeed, drawing on the fact that one-stop-shop model in Kenya is largely a product of regime change, it stems more from political rather than from organizational learning and internal bureaucratic processes. This means it is likely to suffer from issues of political will with the change of government, particularly, if the model is not effectively institutionalized and internalized by county governments. Certainly, this also brings to fore concerns with bureaucratic capacity and organizational commitment toward the realization of effective service delivery in the long run. Therefore, inasmuch as one-stop-shop may foster technical environments as pertains to service delivery, it may be similarly politicized or get caught in the political tug-of-wars, which ostensibly may flop its implementation process. In the same way, bureaucratic oversight can only be sustained through the change of institutional environments, as well as instrumental-cultural dimensions of the bureaucracy.

The above discussion also demonstrates that one-stop-shop in Kenya has remained more of urban than rural experience. This implies that one-stop-shop can be more successful in situations where both ICT and urban infrastructures are relatively well developed. That said, one-stop-shop model in Kenya is relatively not accessible to majority of citizens residing outside key cities or county headquarters. This challenge with location proximity of one-stop-shop kiosks also applies to accessibility to *e-citizen* platform in Kenya.

All in all, it is emphasized that the sustainability of one-stop-shop model like in the case of Kenya may embody a combination of resource capacity for establishment of relevant infrastructures, sensitization of both citizens and bureaucrats, as well as a focus on how to address structural challenges to organizational performance of the bureaucracy. Otherwise, one-stop-shop may end up like one of the many administrative reform routines common in reform processes (cf. Brunsson 2006). As a consequence, when evaluating the effectiveness of one-stop-shop in public service delivery, the contextual specific means-end designs or goals-outcomes dichotomies, inherent power relations, and political will, as well as how these shape up during implementation process, can hardly be overlooked. That is, just like any other policy reform, one-stop-shop model may as well go through instrumental-cultural compatibility test in the public sector, which is oftentimes characterized by trade-offs and conflicting power relations

between some key actors during the implementation process.

# Online Higher Education Marketing: A Call for Renewal

Osama Hazzi[1] and Sami Aldejwi[2]
[1]FrontiersToday, Vienna, Austria
[2]Management Department, College of Business Administration, Taibah University, Al-Madinah, Saudi Arabia

## Synonyms

Educational marketing; Higher education organizations; Online higher education

## Definitions

From the current reference work entry standpoint:

Online higher education organizations are those whose typical activity is to online provide post-high school education and award higher education degrees (e.g., associate degree, bachelor's degree, postgraduate diploma, master's degree, and doctorate).

Educational marketing is a strategy based on marketing practices educational organizations consider to market curricula (degree-awarding mode, accreditation, website, tuition fees, marketing costs, and culture).

## Introduction

Demographic and technological changes – not to mention the current global pandemic – are among other things that impose a fait accompli on online higher education organizations to regularly reconsider their marketing strategies. Unfortunately, there are mindsets that go against this grain – disorienting their marketing compass and ending up with closedown.

The current entry translates personal experience with online higher education organizations, whose disciplines are related to business, into practice – hoping to consider.

## Trends and Practices

Online higher education organizations, whose disciplines are related to business, have the chance to online award publication-based higher degrees (e.g., master's/doctorate degrees by publications on human resource management/organizational behavior). Tens of courses in programs such as Bachelor of Arts (BA) in Business and Management/Master of Business Administration (MBA) new established American online business schools offer do not always fulfill market expectations. Should this course load be necessary, the online fast-track MBA/doctorate blended with key courses (field visits, if possible) and publications could be alternative instead. A master-level teaching experience shows that going beyond the memorization-based learning mode to include field visits (where students meet human resource managers, HRMs) and inviting HR seniors (where they share their experiences with students) helps students to match between the theory and practice and may pave the way for employment (an end graduates looks for).

This degree-awarding mode (online higher degrees by publications) could be in demand by those with the intention of translating their professional experiences into publications. Such practice "Education by Publication" could advance the publishing culture at the public and contribute to the society welfare – not to mention that it could be alternative to get academic credit for work experience. Concerning the society welfare, online higher education organizations could orient this degree-awarding mode to focus on those, whose business philosophies contribute to sustaining the society welfare – awarding online higher degrees by publications on business sustainability, for example.

The belief here is that online higher degrees by publications (aforementioned), for example, in journals listed in quality databases could lend credibility to the degree-awarding-working mechanism and hold true as an efficient alternative for the accreditation issue instead, where the latter is a marathon and requires time and effort – not to mention fees quality assurance agencies charge (e.g., more than USD 8000 for few-week processing time to offer the accreditation). In this view, learners would publish in company with professors (supervisors), whose publications are present in quality publishers.

In the online higher education industry, the website is indispensable. It is the imprint where learners recognize the extent to which the education offered is quality. Online higher education organizations should consider this practice. It holds primarily concerned with usability: easy and free use of the website – not to mention factual information. Online higher education organizations that use websites exaggerating the advertising/with deceptive marketing practices/deceptive appearance (e.g., "high quality," "affordable price," false information on staff/benefits graduates would get) should reconsider their website marketing practices.

New established online higher education organizations should not overlook the fact that the world is rich with well-established universities that online offer quality accredited curricula with reasonable tuition fees. Also, there are online platforms that offer free and affordable self-paced learning from quality universities and organizations. However, there are working philosophies of new established American online business schools that much consider the American business degree as an excellence (above any consideration, so to speak) – overestimating tuition fees. Should this be necessary, support low and lower middle-income country participants (e.g., scholarships/tuition fee waivers/local currency payment) and flexibility to pay tuition fees in installments are among other win-win practices that could pay off for such those online business schools (e.g., quality corporate social responsibility, CSR) and that make a significant difference for learners, whose concerns are about affordability.

To well carry out these practices (aforementioned), online higher education organizations should consider the educational marketing costs-related practice as it is a double-edged sword. Educational marketing costs spent without return are an unfavorable consequence for online higher education organizations, especially new established. New established American online business schools claim that a typical US MBA program spends on average USD 8000 to get

one student. Should this practice be necessary, it should consider the marketing budget and organize campaigns (especially, online) to attract a more diverse student population – considering balance between expectations of the outcomes and reality (competition).

From a marketing perspective, online higher education organizations need to consider the cultural dimension to further gain a market share. Pew Research Center (2017) projections show that, by 2060, Muslims (3.0 billion, or 31% of the population) will near the Christians (3.2 billion, or 32%); that, in 2070, Muslims are expected to reach parity with the latter; that, by 2075, Muslims are expected to outnumber Christians; and that, by 2100, Muslims are expected to make up 34.9% of the world's population and Christians to make up 33.8%. Globally, there are universities that have considered the culture issue in their curricula. Islamic Economics is a real-life example.

## Conclusion

The higher education industry has a unique culture that sets it apart from other industries, and higher education institutions often face unexpected changes due to shifting external economic and political conditions (Aldejwi 2014); however, the online higher education industry is promising, and those in charge could consider practices (aforementioned) to develop marketing strategies that maintain competitive advantages – noting that not all these practices hold true for other online higher education organizations (online non-business schools).

The current entry believes that other experiences are rich with various philosophies on the online higher education industry, and so this entry calls for a renewal of this industry – hoping to well orient the prevailing online higher education compass.

# Online Teaching in Higher Education During the COVID-19 Crisis

A. Vyas
Division of Science, Engineering and Health Studies, SPEED, The Hong Kong Polytechnic University, Hong Kong, China

## Synonyms

COVID-19; Higher education; Online education; Self-directed learning; Technological advantage

## Definitions

The unsettling consequences of the COVID-19 outbreak is no exception as it has impacted all sectors including higher education. Online courses and livestreaming classes have been adopted by colleges and universities to ensure the continuity of teaching and learning at a time when campuses are forced to shut down owing to COVID-19. This defines online teaching in higher education during the COVID-19 crisis.

## Introduction

The novel coronavirus (COVID-19) pandemic has created and continues to bring exceptional disturbances to precisely all facets of life. The higher education (HE) sector is no exclusion, as demonstrated by majority of the HE organizations compelled to shut down physical facilities and

move all teaching and learning activities to being online, forcing them to bring in courses through online portals. The education sector are utilizing technology resources that are available such as digital video conferencing platforms like Zoom, Google Meets, and Google Classroom, among many others. While many in the HE sector may have preceding involvement with online education before COVID-19, not many have embraced it at a level and concentration as demanded by the pandemic situation. Confirming successful commitment in online education has thus become an urgent priority in higher education in the episode of COVID-19.

The need to create a learning environment particularly for students under the science or engineering major poses more challenges as the requirements of effective learning involves access to both classroom instruction (which can be substituted with online lecturers), as well as laboratory-based practical activities. Remote laboratories are no doubt an option and do allow students to carry out experiments and laboratory tasks over the Internet without being physically present, but they do require planning and might not be a feasible option for all kinds of experiments especially of the levels required in HE. Unfortunately, the COVID-19 outbreak neither gave people enough time nor did they have the experience and know-how to carry out remote experiments.

## Online Teaching During COVID-19: Experiences and Challenges

While the online teaching and learning are rapidly adopted during the crisis, there are still discussions on the effectiveness, barriers, and challenges of such the platform. Many scholars have studied online education as the response to the pandemic and examined its advantages and challenges. Hussein et al. (2020) revealed that cost-effectiveness, time-effectiveness, convenience, and safety are positive attributes of online learning especially during the pandemic. Chakraborty et al. (2020) disclosed students' opinion on online teaching and learning amid the pandemic and uncovered that students appreciated the use of learning materials and software to support online learning. Maier et al. (2020) also discovered that online learning has made it easier for students to complete their tasks more easily, improve the quality of their work, and enjoy their studies.

However, the online learning research by Ferri et al. (2020) revealed that there are three main barriers to online teaching and learning including (i) technological challenges relating to the Internet and electronic devices; (ii) pedagogical challenges such as lack of digital skills and online resources; and (iii) social challenges, e.g., human interaction and physical spaces at home for online learning. Similarly, some barriers, i.e., lack of resources such as the Internet facilities, have been highlighted (Adarkwah 2020; Adnan and Anwar 2020; Ferri et al. 2020). Hussein et al. (2020) that studied emergency online learning during COVID-19 in the United Arab Emirates found that online learning experience has been distracted by technological problems, Internet, and insufficient support.

Moreover, the readiness in online teaching and learning of teachers and students is also crucial for adopting such a platform. Callo and Yazon (2020) examined the factors that influence readiness in online teaching and learning. The study found that students and teachers' readiness in online teaching and learning is determined by their capability, accessibility, and confidence to use the technology. In the same vein, König et al. (2020) argued that information and communication technologies (ICT) tools are important for teachers in digital competence and online teaching during the pandemic. Chakraborty et al. (2020) also discovered that students felt online learning was stressful and affected their health and social life.

While online teaching and learning might be a potential emergency response from the education sector in the midst of a crisis such as the COVID-19 pandemic, there are some impacts on teachers and students and factors that influence online education as well. Moreover, there are multiple challenges that need to be overcome. On many occasions, students do not have reliable Internet access and/or appropriate technology; therefore they struggle to fully partake in digital education.

Such technological disruptions are seen across universities and between various disciplines within universities. According to OECD data, while approximately 95% of students in Switzerland, Norway, and Austria possess computers to utilize for their coursework and learning, only 34% in Indonesia do. In large countries like the UK and the USA, there is a considerable gap among students from privileged and disadvantaged families, where children from a privileged background had their own computers to work on, while nearly 25% of those from underprivileged backgrounds did not. While some schools and governments have been providing digital equipment to students in need, such as in New South Wales, Australia, many fear that the pandemic will broaden the digital divide (OECD 2020).

Finally, in engineering and the sciences, there is a requirement for practical work. The laboratory experiments support students appreciate science subjects realistically and are an essential element of science education (Çepni et al. 1995). Occasionally, this necessitates expert advice and assistance, large equipment handling, and hands-on activities. Thus, while remote education and laboratories are an alternative to education during the pandemic, their environments do not offer students the opportunity of accurately managing laboratory instruments or learning to use more specialized software required for effective learning. Moreover, many remote labs do not offer or allow students to carrying out experiments that need teamwork and in-person management. Finally, working entirely by means of remote labs does not provide the same learning environment as the traditional labs do both in terms of competencies and collaborative learning. Undoubtedly, remote labs are good in blended learning in concurrence with conventional hands-on labs but not as the only mode of scientific experimental learning. If the practical experience continues to be remote, it might result in a compromise in the learning outcome.

## Recommendations

While most HE have moved to providing online teaching, it is essential for the governments around the world to ensure that the students have the accessibility in terms of resources and connectivity. Many countries have seen the government offering free equipment to the disadvantaged. The teachers as well as the students have been made to move their classes online with neither proper training nor additional budget. Callo and Yazon (2020) suggested that if online teaching and learning is well planned, it could be as effective as face-to-face learning. However, as teachers and students lack online teaching and learning resources, in order to enhance online education, they should be provided with electronic devices and Internet connection as needed for online teaching and learning. Also, educational institutions should facilitate the online delivery service system for both of them. Specifically, teachers need to be trained and provided with guidelines for using online system facilities. The materials for online teaching must be prepared, as well as policy guideline to evaluate the effectiveness and efficiency of online teaching and learning should be considered. Additional sessions related to computer literacy, especially when operating remote labs, must be offered for both teachers and students to ensure effective teaching and learning. It is ascertained that an accessible design of the online teaching platform and regular feedback mechanism from the user will enhance the acceptability of e-learning. In addition to that, educational institutions should be flexible and creative for creating policies and practices for effective online teaching and learning (Callo and Yazon 2020; Ferri et al. 2020). Adarkwah (2020) proposed that in low-income countries where there are electricity and Internet shortages, the use of solar power gadgets, blended learning, and electronic devices' facilitation, i.e., providing of mobile devices instead of costly laptops, could be some strategies that might be considered to improve the online education. Apart from that, diverse modalities should be adopted, e.g., online courses, TV, and radio, to provide learning to students in remote areas, and inclusive tools and platforms must be considered for making online resources for a broader audience with disabilities (Ferri et al. 2020).

Governments play a vital role in the provision of various public facilities, including education.

The education sector has been facing a sudden migration to online teaching and learning during the current crisis (Mohmmed et al. 2020). The governments might consider some suggestions to further improve policy and practice concerning online teaching and learning in emergency times. Mishra et al. (2020) and Zhang et al. (2020) suggested that governments should promote educational construction and assessment information to see whether it can meet the demand for online teaching and learn in emergency times. Simultaneously, some regulations might also be needed to support online teaching and learning concerning high-quality Internet connection. In addition, some researchers have also recommended offering standardized home-based teaching facilities to teachers, such as electronic online teaching devices, i.e., computer, laptop, and tablet, and considering students' basic need for online learning equipment as well (Adarkwah 2020; Dube 2020; Ferri et al. 2020; Zhang et al. 2020). According to Adarkwah (2020) and Dube (2020), the equality between the rich and the poor or rural and urban area should also be considered ensuring the effectiveness and accessibility of online teaching and learning. Zhang et al. (2020) also suggested that systematic training for teachers to utilize online teaching tools is essential to teaching quality. Plus, teachers should get assistance from governments, such as administrative, legal, and financial support for training. Governments should also be included in supporting and calling for online education research. The results of the research could be information to improve online teaching and learning.

## Conclusion

It is key to identify and reflect the ways in which HE organizations can enable effective online involvement as this would be essential to operate online education successfully. Tackling this issue is most crucial to handle the current situation of COVID-19, where online education is the most feasible, if not the only, alternate to traditional classroom teaching and learning. The lessons learned are also expected to have profound outcome and will offer appreciated and required direction to comparable emergency situations in the future, similar to how the experience of dealing with SARS (severe acute respiratory syndrome) or MERS (Middle East respiratory syndrome) previously proved to be helpful in some of the comparatively positive and effective responses to COVID-19 (Hartley and Jarvis 2020; Moon 2020). In spite of this effort, the compromise in science education will remain, and the establishment of remote laboratories in science and engineering education will, in spite of all efforts, continue to negatively impact the learning process of students. During the COVID-19 pandemic, the lack of campus access owing to the lockdown and online mode of classes could no doubt complete the syllabus; nevertheless, students faced irreplaceable challenges in completing the laboratory experiments.

# Open Data Policies and Practices in Local Governments

Younhee Kim
School of Public Affairs, Pennsylvania State University Harrisburg, Middletown, PA, USA

## Synonyms

Data sharing; Information disclosure

## Definition

- Open government data: freely accessible to use and reproduce nonprivacy-restricted and non-confidential data generated by public resources in a standardized, machine-readable format
- Open data portal: a digital repository to search and access government datasets
- Open formats: ways to publish data in machine-readable or machine-processable layouts for easy access, search capability, and advanced analysis

## Introduction

Open government data is considered as a parallel of the early effort of online information dissemination that helps citizens to understand what their governments do and how well they perform. As government has collected a large volume of various data, the use of government data has gained more attention to address complex problems in society, improve service delivery, evaluate policy outcomes, and promote transparency and citizen participation. Besides, releasing economic data is expected to create business opportunities and growth for civic-minded developers in innovative ways. These are directly related to the main reasons for opening government data, which are transparency, participatory governance, social and economic value, and internal use (Janssen 2012). Data are costly generated and collected, so broad access to sufficient-quality data will bring a visible impact of open data in and outside of government.

At the beginning of opening government data in the United States, data openness took a specific step to focus much on a physical format of data availability for its secondary use. The 250,743 datasets from federal, state, and local agencies have been released to the public by early November 2019 on Data.gov that is the online open data repository of the federal government launched in May 2009. Allowing broad access to government data provides higher returns on public investment, as external users can generate economic values out of the downstream use of outputs (Janssen et al. 2012). The paradigm of opening more government data became the baseline of the government-mandated responsibility for federal agencies after the passage of Open, Public, Electronic, and Necessary (OPEN) Government Data Act on January 14, 2019. The Act mandates

the key aspects of Open Data Policy announced in May 2013 to create the value of federal data assets in economic, political, and social contexts.

Local open data is most relevant to citizens daily. Given the increase in citizen connectivity through social media and mobile devices, local governments use citizen inputs to respond to their needs and improve service delivery. The US City Open Data Census has reported that the level of openness of key datasets has been increased over time. In 2019, 461 out of 864 datasets submitted to the Census were openly released from 266 cities. On Data.gov, 20,185 datasets (8%) were voluntarily submitted from city and county governments. Aligning with the federal open data project, local governments have operated open data portals to make datasets publicly available and accessible via own data portals or sites built by commercial or nonprofit providers. Data.gov has listed 48 US cities and counties' open data sites as of November 2019. Local governments have committed to releasing data in the past few years, but only a handful has initiated open data policies and invests in resources to open up data.

This chapter discusses how local governments in the United States leverage open data policies and practices to foster the open data movement. This chapter first reviews the meaning of open data in government and the main reasons to develop an open data policy for local government. The 31 guidelines developed by the Sunlight Foundation are introduced to help local governments initiate open data policies, categorizing into the administrative, legal, and technical aspects. The next section, then, analyzes the open data practices of local governments in topics, types, and formats of datasets that are on Data.gov, the US City Open Data Census, and the Code for America. This chapter concludes with the barriers to open data and the implications for promoting the use of open data in local government.

## Open Data Policy in Local Government

Government views data as a strategic asset and manages it to improve decision-making and produce more value. Open data is defined as "non-privacy-restricted and non-confidential data which is produced with public money and is made available without any restrictions on its usage or distribution" (Janssen et al. 2012, p. 258). Restriction free commonly refers to universal access, interoperability, and no copyright restriction, but not for personal data. The format of open data is standardized written in programing language and machine-readable processed by a computer so that datasets are convenient to be redistributed and reusable. The term open data broadly denotes opening government data freely available to anyone to use, reuse, and redistribute in a machine-readable format. The concept of open data is considered as "a tool of open government directives" to achieve three principles of transparency, participation, and collaboration (Kim 2017, p. 245). But it has been further evolved to formalize new rules and standards across governments.

Cities and counties have opened data to some extent, but not all have an open data policy or initiatives. Similar to benefits to federal and state governments, open data also helps local governments improve accountability, efficiency, and economic growth. Having an open data policy in local government is not a symbolic document, but functional action. It makes open data programs successfully implemented and continued without the impact of changes in administrative and political environments. Larrick (2015) interviewed city officials to identify practical reasons for developing an open data policy. The four main reasons to describe the need for an open data policy at the local level were as follows: setting a basic standard framework to unified different practices existing across departments; building a comprehensive data inventory at the department level; committing strong executive support and public engagement; and building a legal framework for accountability and enforcement (Larrick 2015). With an explicit open data policy, local government can foster a culture of open government and evaluate the quality of open data practices.

The Sunlight Foundation has collected 133 open data policies from 109 local governments in 40 states during the 2003–2018 period, including all types of policy, administrative

directive, executive order, legislation, ordinance, council resolution (Open Data Policy Hub 2019). 52.5 percent of the 40 states had one or two local governments to develop open data policies. California (22) had the highest number of local governments with open data policies, followed by Texas (10), Arizona (8), North Carolina (8), and New York (8). Seventy-two percent of the policies were released since the federal open data policy was announced in May 2013. Most formal open data policies at the local level stated definitions, portals, scopes, formats, designated teams, and requirements. The Sunlight Foundation (March 2014) developed comprehensive and practical open data policy guidelines to help local governments adopt sustainable policies in three categories of types of data, ways to make data, and ways to implement policy. The Foundation has continued to list its collected cases, matching to the 31 guidelines presented in Table 1. Existing local open data policies included key aspects of the guidelines to some degree.

The guidelines are involved in administrative, legal, and technical dimensions. All guidelines are not exclusively different. Some are featured in similar characters. Administrative motivations primarily focus on the values and goals of opening government data. In reviewing the cases on the Sunlight Foundation website related to Guideline 3 in Table 1, the values and goals of open data were similarly stated across cities and counties, which are transparency, accountability, social and economic benefits, participation, public knowledge, collaboration, public-private partnerships, innovation, performance improvement, and

accuracy of government operations. Interestingly, data policies in Portland, OR, and Raleigh, NC, stated the involvement of the local software community to develop software applications and tools to share government data. Guideline 5 offers reasonable justifications to determine dataset prioritization for data release aligning with resource availability and organizational priorities. The main influencing factors listed in cases are cost, a timeline, the attainment of open data values and goals, the quality of data, public interest and feedback, frequency of public requests, opportunities, and benefits.

The legal aspect mainly deals with accessibility, security, and authority issues. Guideline 7 in Table 1 specifies information sensitivity for privacy, security, confidentiality, and intellectual property concerns to determine information disclosure. Conceptually, data that has been created with public resources should be available to the public, so that any exemptions to data release should be carefully reviewed and regulated. Most local governments made explicit, straightforward statements in securing and releasing sensitive and protected data. Before the 2013 Open Data Policy, the Freedom of Information Act was the legal framework to outline the full or partial disclosure of government data for local governments. Chicago, IL, Nashville, TN, Denton, TX, and Waco, TX, defined the scope of releasing and not releasing data in detail. The City of Wichita, KS, mandated its data accessible to the public by default and required justification if agencies cannot release their data publicly in 2016. A chief data officer for the City is responsible for evaluating protected data categories from the release of data. In interpreting Guideline 11, the City of Austin, TX, ensured free use and reuse of the city's open data without legal requirements but applied some restrictions to compile or modify open data by nongovernmental parties or individuals. Nashville, TN, clarified no guaranty to claim the unrestricted use of the city's open data once open data is removed from the portal.

The technical aspect broadly covers formats, methods of data collection, and ways to publish data. Guidelines 8 and 9 indicate data types for easy access, search capability, and advanced analysis, including machine-readable and machine-processable data. It is vital to publish open data for reuse. Cities and counties stated that data were structured, following general open formats that are "be retrieved, downloaded, indexed, and searched by commonly used web search applications. . .platform independent, machine readable, and made available to the public" (Orszag 2009, p. 2). The data should be further formatted to be converted into commonly used software or web applications for new uses, such as CSV, XLS, XML, and JSON. Both CSV and XLS are a spreadsheet format, while XML and JSON are used to receive data from a web server. The CVS format will be a good starting point for most tabular open data in local government.

Guideline 20 suggests creating application programming interfaces (APIs) that allow computer programs to search, retrieve, or consume data via online, especially for bulk download. Minimum requirements for the standard metadata schema specified in Project Open Data (Burwell et al. 2013) are to make data downloadable as a single file (e.g., a CSV) or through APIs (e.g., a JSON). Local governments have mostly adopted the federal framework to create and maintain data inventory where the maturity areas are expandable, enriched, and open (Project Open Data 2013). Expanding refers to add additional datasets, and enriching denotes to advance the discoverability, management, and reusability of data assets. Examples of enriched cases are to enlarge the number of keyword tags, clarify descriptions of data, or add additional metadata fields (Project Open Data 2013). Eleven local governments (i.e., New York, NY, Honolulu, HI, Boston, MA, Washington, DC, Minneapolis, MN, Arlington County, VA, Anchorage, AK, Naperville, IL, Salina, CA, Modesto, CA, Wichita, KS) listed in Guideline 20 included the automated technology application showcase on open policies.

## Open Data Practice

The directions of open data policies in local government have been far more informative,

innovative, and inclusive to communication and collaboration with broader stakeholders in promoting the open government paradigm. Data demands have rapidly increased in and outside of government, as the increase in availability and convenience to government via electronic or mobile platforms offers a broad range of opportunities to various stakeholders. Local governments have created different types of data that might provide higher returns on public investment. On Data.gov searched in early November 2019, about 50% of local government data was geospatial datasets. The other half of data topics varied across parks, boundaries, transportation, budget, sustainability, recreation, education, school, police, construction, zoning, health, crime, parking, housing, ethics, pension, and other issues. The most common data format was CVS (8162), followed by JSON (7202), XML (5997), and RDF (5561). Datasets were also formatted by EXE, HTML, ZIP, and others (Data.gov 2019).

The top 10 viewed datasets in the city and county government types are presented in Table 2, including only non-geospatial datasets. The top 10 cities and counties proactively published open datasets on Data.gov are City of New York (2624), City of Austin (1589), City of Chicago (763), Cook County of Illinois (569), City of San Francisco (566), City of Baltimore (459), City of Seattle (450), City of Los Angeles (335), Montgomery County of Maryland (308), and Allegheny County/City of Pittsburg/Western PA Regional Data Center (249). The number of the total open datasets by each local government is ranged from 25 to 2624.

The US City Open Data Census measures public access to open datasets based on the level of openness across the 20 subject categories: budget, business listings, code violations, construction permits, crime reports, emergency calls, employee salaries, lobbyist activity, parcels, police use-of-force, procurement contracts, property assessment, property transfers, public facilities, restaurant inspections, service requests, spending, traffic crashes, website analytics, and zoning. If a municipality openly publishes all 20 subject areas of datasets, its openness score will be 100%. Only two cities, Las Vegas, NV, and City of Cincinnati, OH, published datasets across all 20 subject fields, and their overall scores were 99% each. The reason that two cities did not get 100% is lack of the open format or out-of-date. The City of Las Vegas received 83% in the traffic crashes due to the out-of-date issue. The City of Cincinnati scored 89% in the lobbying activity and 83% in the parcels because of not in open format and out-of-date, respectively. In reviewing the other six cities with over 80 percent of the overall score, the most common reasons to decrease a level of openness are lack of openly licensed data, out-of-date data, lack of available data in bulk, and lack of open format data (Open Data Census 2019).

The Code for America has worked with governments to promote openness and collaboration with communities and civic tech practitioners by building open source applications. In particular,

**Open Data Policies and Practices in Local Governments, Table 2** The most viewed datasets in local governments

| City | Dataset | Views | Updated date |
|---|---|---|---|
| City of New York | Demographic statistics by zip code | 1186 | March 29, 2019 |
| City of New York | Popular baby names | 211 | June 14, 2019 |
| City of Chicago | Average daily traffic counts | 122 | August 3, 2018 |
| Allegheny County | Allegheny County property sale transitions | 118 | February 3, 2018 |
| Allegheny County | Pittsburg neighborhoods map | 101 | March 2, 2017 |
| Town of Cary | Local weather archive | 89 | July 22, 2017 |
| Allegheny County | Allegheny County sheriff sales | 88 | August 3, 2018 |
| King County | 2016 general – election results by precinct | 73 | August 9, 2018 |
| City of Charlotte | City employee salaries March 2018 | 62 | August 3, 2018 |
| City of New York | Directory of homeless population by year | 60 | March 29, 2019 |

Code for America Brigade collaborates with local government to make local communities better, focusing on data, design, and technology. The 85 official brigades from 40 states are jointed on Code for America Brigade by early November 2019. California and North Carolina have the largest number of participating municipalities in this network, which are ten and eight, respectively. In the North Carolina network, the Open Raleigh portal aims to develop opportunities for economic development, commerce, increased investment, and public engagement by providing more on business and financial data. Open Raleigh has published 191 datasets by November 2019. The Open Durham portal has opened 207 datasets to users to explore, visualize, and download county and city data, so that citizens can have more interaction with government data.

A wide range of the datasets made publicly available online by local governments is informative and innovative. These open data practices at the local level have created valuable opportunities to communicate and collaborate with communities and beyond. Entrepreneurs, researchers, and civic tech practitioners have used open government data to develop, assess, and improve the quality of products and services at the local level. Like the Code for America case, government allows users to give feedback on or correct released data, which occurs mutual data exchange between government and users. It should not be an issue of whether municipalities have or have no open data. It is a matter of the quality and continuity of opening data practices. The framework for managing open data outlined by Project Open Data might be feasible approaches for local governments. Its suggested checklists to evaluate the maturity of open data practices in terms of the expanding, enriching, and opening categories will help local governments to identify a place where they should look at first.

## Discussion and Conclusion

Portals for linked local open data have been steadily grown in recent years. The foundations of open government data help the local government to be more transparent, participatory, and respond to internal and external stakeholders. Opening data itself does not guarantee to achieve these goals. Still, it is the first step to identify ways to publicize past, current, and future governments' work. The level and maturity of open data policies and practices have varied across local governments, so cities and counties have to commit to providing, maintaining, and updating the high quality of open data. Practical barriers of opening data in local government are primarily related to several pressing issues where municipalities have faced, such as insufficient financial and administrative resources, inadequate technological issues, privacy considerations, copyright restrictions, and legal issues. Besides, lack of public interest, lack of public awareness, or few public requests for data make local government away from publicly releasing data. As Conradie and Choenni (2014) suggested, local governments begin to release small-scale data and low-cost data to create open data culture.

Concerning the emerging trend of data-driven government nationwide, local governments should also focus on using data effectively to increase efficiency, accomplish a mission, and improve decision-making. The open data practice is an expensive and labor-intensive activity for municipalities, so the beneficial, proven use of released data should contribute to transparent government, participatory governance, and economic growth. To what extent do local governments use open data to be more approachable to communities and residents? The What Works Cities program launched by Bloomberg Philanthropies in 2015 (www.whatworkscities.bloomberg.org) is a case to accelerate cities' use of data and evidence to overcome challenges, such as fraud, waste, and abuse at the local level. Data collected from residents allows the government to respond to issues outlined explicitly for communities. The open data movement has evolved to not only opening data appropriately to the public but also using data smartly by internal and external stakeholders. With more open data, local governments can learn more about the needs

of residents, set priorities, and solve target problems transparently.

# Open Government

Bernd W. Wirtz, Peter Daiser and Steven Birkmeyer
German University of Administrative Sciences Speyer, Speyer, Germany

## Synonyms

Digital government; E-democracy; E-government; Government 2.0

## Definition

Open government is a concept that generates a transparent, participatory, collaborative, and innovative government environment by providing existing data and knowledge to third parties and integrating external knowledge into political and administrative processes.

## Introduction

Open government has become an important topic for governments all over the world (compare for the following Wirtz and Birkmeyer 2015; Wirtz and Daiser 2015, 2016; Wirtz et al. 2017). In particular, the benefits that are attributed to the concept, such as increased citizen trust, enhanced citizen-government communication, and improved internal efficiency, promote open government on a global scale. The growing importance of open government is underlined by the Open Government Partnership, which was established in 2011 and already counts 75 member countries (Open Government Partnership 2017).

In principle, open government refers to the transparency of public sector actions, the accessibility of public sector information, and the public sector responsiveness to third parties (OECD 2009). These developments cause significant transformation efforts since existing administrative structures do rather show bureaucratic, hierarchical, and rigid thinking patterns. Thus, despite

the paramount importance of open government, the concept's realization is still a major public administration challenge.

The open government idea itself – providing access to public sector data – is not a new or groundbreaking concept. This idea has already come up in varying contexts, such as freedom of information and anti-corruption initiatives. Nevertheless, the underlying concept of open government provides manifold opportunities to the government and its stakeholders. These opportunities result from the three building blocks of open government, the so-called pillars: transparency, participation, and collaboration (Reddick and Ganapati 2011).

The three open government pillars target at public value creation. Public value describes the value that governments contribute to society. The creation of public value is a key objective of governmental and administrative action (Moore 1995). Since transparency, participation, and collaboration have a positive influence on the relationships between the government and its stakeholders, open government is expected to contribute to public value creation.

While transparency, participation, and collaboration as well as public stakeholders and the relations with them are the main open government components, there are also external drivers (accountability, technology, acceptance/trust, and regulation/law), which have a strong impact on the design, realization, and evolution of open government. Reconciling these internal factors and external drivers in an integrated, coherent approach is a great challenge of any open government initiative.

Given their importance, it is necessary that governments consider these factors and drivers when preparing and conducting open government initiatives. Else, these initiatives may not deliver their full potential and may cause a deterioration of the relationship between the government and its public stakeholders. Against this background, Wirtz and Birkmeyer (2015) recommend the use of their Open Government Framework, which visualizes the interplay of the relevant open government factors and drivers and, thus, supports governments in open government endeavors. Since their framework, which is depicted in Fig. 1, presents a clear overview of relevant open government components, it is used to structure the succeeding explanatory section. The individual parts of the Open Government Framework are outlined in the following.

## Transparency

Transparency is one of the most frequently mentioned elements of open government. Following the suggestion of van Dooren et al. (2012), transparency consists of three key components: (1) systematic, timely release of information, (2) an effective monitoring and influencing role for legislature, and (3) an effective monitoring and influencing role of the public through media and nongovernmental organizations. Thus, the core elements of transparency in an open government context are public access to governmental information and timely publication of information. Against this background, transparency is often regarded as a trust-building concept. Such information policy principles can be traced back more than two centuries. "In fact, the first freedom-of-information law – Sweden's 1766 Freedom of the Press Act – was driven by party politics, as the new majority in parliament sought to see documents that the previous government had kept secret" (Blanton 2002, p. 52). However, the increasing importance of open government has again stimulated the attention devoted to transparency.

## Participation

Participation is another pillar of open government. By means of participation, public stakeholders become involved in public administration and policy-making through information exchange. Harrison et al. (2012), for instance, understand participation as involving citizens in civic affairs through discussion and deliberation. Given the additional input and engagement of public stakeholders, participation is supposed to encourage their commitment concerning decisions made. Furthermore, participation creates opportunities for the

**Open Government, Fig. 1** Open government framework

community to participate in public policy-making and provides the government with additional insights and knowledge. In summary, participation shall enhance public administration effectiveness and the quality of public policy-making.

## Collaboration

The third pillar of open government is collaboration. Collaboration aims at actively engaging the society in public decisions and policy-making through participation of citizens and organizations in administrative and policy procedures as well as enhancing the cooperation among different agencies and departments within public administration. In other words, in an open government context, governments shall actively involve the public in creating solutions to governmental and societal challenges and promote cooperation among distinctive governmental and public administration entities.

## Open Government Drivers

The internal part of the Open Government Framework (transparency, participation, collaboration, government/public administration, stakeholders) is constantly influenced by external factors (accountability, technology, acceptance/trust, and regulation/law), the so-called open government drivers.

Accountability is a key element of democratic governance. It refers to the obligation of the government and its representatives that they are accountable and responsible for their actions and decisions (Schillemans et al. 2013). Accountability is an important driver for open government since it is directly linked with transparency: transparent policies ensure accountability, and accountability promotes transparency (Ball 2009).

Technology is a further key driver of open government. In particular, the rise of the Internet and social media technologies has facilitated

social online interaction and data exchange. These developments have accelerated the impetus for open government. On the other hand, open government implementation also requires significant technology and network infrastructure investments. A further point that needs to be addressed when speaking about technology in an open government context is social media.

Social media are regarded a cornerstone of open government (for this passage compare Wirtz et al. 2017). Kaplan and Haenlein (2010) divide social media into four groups: weblogs (e.g., blogs), collaborative projects (e.g., wikis, online forums), social networking sites (e.g., Facebook), and content communities (e.g., YouTube). Each of these groups possesses particular advantages that support their use for open government. In summary, social media can complement existing open government approaches by reaching new target groups and by optimizing existing services or providing entirely new application areas. Thus, social media technologies can be effective instruments to support specific open government targets, improve citizen-stakeholder interaction, and foster open government initiatives in general.

Acceptance and trust are further important conditions for open government. In this context, acceptance reflects the degree of consent of the public concerning the open government initiatives and trusts the level of confidence of the public in their government. If the citizens do not accept the open government initiatives or the associated technologies, they will not participate or collaborate. Similarly, they need to have a certain level of trust, because, otherwise, they may not believe the information offered.

Regulations and laws provide the legal framework for open government. Since regulations and laws are different in distinctive countries, the design and delivery of open government vary from country to country and sometimes also from region to region or city to city. For example, open government in China is in many ways different from western countries, which generally place greater emphasis on freedom of information (Piotrowski et al. 2009). Apart from that, administrative action also requires clear laws and regulations. A common legal and regulatory basis supports transparency and provides the fundament for consistent and legitimate actions (Ball 2009).

Summarizing, the external open government drivers (accountability, technology, acceptance/trust, and regulation/law) have a constituting, conditioning, supporting, and/or promoting impact on open government. A further important aspect of the Open Government Framework is the relationships between the government and its stakeholders, which are outlined in the following section.

## G2C, G2B, and G2G Relationships

The government-to-citizen (G2C), government-to-business (G2B), and government-to-government (G2G) relationships are important open government facets that are influenced by several factors. From an internal perspective, transparency, for instance, possesses great potential to enhance the relationships between the government and its stakeholders. And participatory and/or collaborative actions promote the joint commitment of the parties involved (Chun et al. 2010). From an external perspective, the G2C, G2B, and G2G relationships are also affected by the open government drivers. Taking technology as an example, modern information and communication as well as social media technologies have massively altered the relationships between the government and its stakeholders. Associated factors, such as availability of information, rapid data transmission, new participation possibilities, and changing citizen behavior, have reshaped stakeholder demands, expectations, and attitude toward government service.

## Conclusion

Open government is a concept that generates a transparent, participatory, collaborative, and innovative government environment by providing existing data and knowledge to third parties and integrating external knowledge into political and administrative processes. In this context, transparency, participation, and collaboration form the core of open government. These pillars are seen as the key levers to increase citizen trust into the

government, enhance government-stakeholder communication, and improve the efficiency and the effectiveness of public policy-making and administrative actions.

Although the idea of sharing public information with citizens is not a novel, groundbreaking idea, the technological developments concerning modern information and communication technologies have paved the way for more effective participation and collaboration settings between the government and its stakeholders. In the future, especially social media can take an important open government role. On the one hand, social media provides manifold opportunities to (further) develop open government tools, methods, and systems. On the other hand, the broad dissemination of social media applications may influence citizen behavior, demands, and expectations on a global scale, supporting worldwide open government progress and harmonization.

## Synonyms

Citizen; E-government; Open data; Open government; Smart government; Transparency

## Definition

Open government is responsible for providing access to a large amount of data, responsible for providing transparent accounts to society. E-government, on the other hand, is the means by which citizens or other spheres that need information start to have access and, in addition, it is a tool capable of providing services to the community.

## Introduction

Making a "smart" city comes up as a strategy to mitigate the problems that come from urban population growth. The use of technology is associated to the concept of a smart city as well as to the objective of its execution, which is life quality.

Some elements that are necessary for the development of a smart city are smart economy, smart people, smart governance, smart mobility, smart environment, and smart life.

Among the aspects mentioned, this entry addresses governance from the perspective of smart cities with an eye on the process of open government, E-government, and their contributions to a good performance of such governance.

In order to understand the proposition of the open government, attention that, through the relationship between Big Data and Open Data, there will be a great amount of open information, which guarantees a set of accessible data about government activities and social actions. This way, the open government's image is seen as a measure that aims at the transparency of governmental actions through data openness, enabling the population to know the work of their respective governments.

E-government, on the other hand, is characterized as a government with intensive or generalized use of information technology applied to public service delivery, the improvement of managerial efficacy, the promotion of values and democratic mechanisms. E-government introduction aims at simplifying and improving the relationships and transactions between public administrations and their users or clients.

From this conceptual view, it is possible to see a complementarity of the open government and E-government elements, for that a big and open database is essential not only for the development of E-government but also for the construction of an open and transparent government, and to enable a good interaction between governments, citizens, and the entrepreneurial environment.

This way, the union of open government with E-government means smart governance objectives that include transparency, open data by using Information and communication technolog (ICT), and E-government when taking participative decisions, and in the co-created e-services, such as applications.

Thus, it is possible to see that the open government enables access to a number of data, which is responsible for the accountability that is transparent to society. On the other hand, E-government is the way through which the citizen or the other spheres that need information have access, which is seen as a tool that is able to offer community services, thus contributing with the development of governance from the smart citizen's perspective.

By taking a look at the connection that exists among these smart cities' government elements and by trying to understand how they are addressed in previous studies, by helping with such comprehension as well as identifying gaps and trends, casting some light on the topics that refer to the issue, the present entry aims at mapping the international production about E-government and open government.

## Stages in the Development of This Entry

In order for this study to be accomplished, a bibliometric analysis was developed with the use of the ISI Web of Science (WoS) database, regarded by Oliveira et al. (2017) and Ceretta et al. (2016) as a multidisciplinary indexing source that gathers renowned journals.

The procedures for data collection considered the time period from 2009 to 2019, totaling 10 years. The collection took place between January 21 and 28, 2019. As a search criterion, the first selection adopted the key words

"E-government" and "open government." In the second selection among the articles that addressed E-government and open government, the term "governance" was used in order to filter those that dealt with the topic from the cities' governance perspective.

Based on these criteria, accuracy elements and word variation were used, with the use of an asterisk (∗) to include the possibility of plural words, and quotes (") for search accuracy. Sample identification was done from these words in the article titles, abstracts, and key words.

Once the search was performed, the following filters were applied: type of document, among which article and review were selected, and areas of study, selected as "Public Administration." The reason for choosing such area was the capability to contribute in detail to this area of interest (Table 1).

The refinement identified 92 works, so their bibliometric analysis was performed, presented as "bibliometric results" and "beyond bibliometrics," which evaluated the contributions given by the 10 most cited articles in the WoS in each area in detail (Tables 2 and 3).

Finally, with the objective to identify the words with highest hits and relevance that show the trends of the researches related to the topics studied, the VOSviewer software was used.

## Bibliometric Results

Concerning the bibliometric analysis, the first observation refers to the number of article publications by country, according to Table 4.

The United States and Spain are among the countries with the highest percentage, with 16.9% and 7.2%, respectively. Despite the strong influence of the first place, Europe has a meaningful participation of countries which publish about open government and E-government, with a total

| 9 | Canada | 3 | 1.50 |
| 10 | Australia | 2 | 1.00 |

Source: Research data (2019)

of 4 (Spain, Holland, England, and Scotland), and an established percentage of 16%. The reason why the United States ranks first in the list of publications on open government lies on the fact that, from 2009, with Barack Obama in the presidency, there was the adoption of the Memorandum on Transparency and Open Government, enabling the Open Government Directive. Following this perspective, three principles were introduced in order to foster open government: transparency, participation, and collaboration (Orszag 2009).

Spain stands out due to the development of the Public Administration Reform (CORA), which started in 2012, as well as to the Plan of Thrust Measures of Information Reuse of the Finance and Public Administration Department 2012–2014 (MINISTERIO DE HACIENDA 2019).

On E-government, both the United States and Spain have a high number of publications. In the United States, the Office of E-government and Information Technology, led by the Chief Information Officer (CIO) of the Federal Government, tries to boost citizens and companies' interaction with government (WHITE HOUSE 2019). In Spain, such topic is under discussion for, in 2005, the Plan of Advance for the Development

of the Information Society and Convergence with Europe and between Autonomous Communities, which establishes E-government and undergoes the 2006–2008 Modernize Plan, the 2011–2015 Plan of Advance 2, the creation of the Digital Agenda for Spain (AGE) in 2013, and the AGE's Plan of Digital Transformation, which explains the number of publications.

The top 5 institutions with the highest number of publications feature the University of Granada (5%) and the University of Zaragoza (5%), both in Spain. They share the same top position with exclusive publications on E-government (Table 5).

Only the Tilburg University (4%), located in Holland, presents articles in the area concerning open government. The ranking of the respective universities in the top 5 supports the position of their countries concerning publications. Table 6 presents the Top 5 authors with the highest number of publications.

**Open Government and E-Government: Concepts, Gaps, Interfaces, and Trends, Table 5** Top 5 institutions with the highest number of publications

| Institutions | Number of articles | % |
|---|---|---|
| University of Granada | 4 | 5 |
| University of Zaragoza | 4 | 5 |
| University of Texas at San Antonio UTSA | 3 | 4 |
| University of Texas System | 3 | 4 |
| Tilburg University | 3 | 4 |

Source: Research Data (2019)

**Open Government and E-Government: Concepts, Gaps, Interfaces, and Trends, Table 6** Top 5 authors with the highest number of publications

| Authors | Number of publications | Authors' institutions |
|---|---|---|
| Bolivar, M.P.R. | 3 | University of Granada |
| Reddick, C.G. | 3 | University of Texas at San Antonio |
| Royo, S. | 3 | University of Zaragoza |
| Ingrams, A. | 3 | Tilburg University |
| Braga, L. V. | 2 | Fundação Getúlio Vargas |

Source: Research data (2019)

Concerning the authors with the highest number of publications, it is possible to see that Bolivar, Reddick, Royo, and Ingrams have all published the same number of articles. However, only Ingrams fully devoted time to the area concerning open government, whereas the remaining authors are limited to the area concerning E-government. As for the author Braga, he is a Brazilian researcher who also devoted time to publications on E-government.

The top 5 journals with the highest numbers of publications are presented in Table 7.

The scientific journal with the highest number of articles published was *Public Management Review* (11%), with all the publications dedicated to the area concerning E-government. *Administration Society* (8%) was the second journal with the highest number of articles published about the topics analyzed, as well as the remaining journals.

One of the possible reasons these journals were chosen for publication may be related to the impact factor, since *Administration Society* holds an impact factor of 1,762 over a 2-year period, ranking 21st out of 47 positions, and *Public Administration*, with an impact factor of 1,646 over a 5-year period, ranking 27th out of 47 positions for the same group (SAGE JOURNALS 2019).

*Public Management Review* ranked 3rd in the Academic Journal Guide (2018) of the Chartered Association of Business Schools (CABS). This ranking is directed to journals that received and

**Open Government and E-Government: Concepts, Gaps, Interfaces, and Trends, Table 7** Top 5 journals with the highest number of publications

| Journals | Number of articles | % |
|---|---|---|
| *Public Management Review* | 9 | 11 |
| *Administration Society* | 7 | 8 |

published original and well-prepared papers that underwent a severe evaluation (CABS 2018).

## Beyond Bibliometrics

### E-government and Open Government Concepts

This section will deal with E-government and open government concepts from the 10 most cited publications in the WoS.

Upon starting the E-government conceptualization, Jun and Weare (2010) state that E-government is a generic set of technologies and services employed by a range of public organizations.

On the other hand, Ahn (2011) states that the purpose of E-government is to improve citizens' participation and government's liability and transparency by enabling a higher level of communication and flow of public information between citizens and government. Moreover, it is highlighted to save financial resources and enable citizen's participation of e-democracy (Norris and Reddick 2012).

To Jun and Weare (2010), the E-government practice is considered an interesting and useful case for the study on innovation dissemination in public organizations. Likewise, to Meijer and Bolívar (2016), previous studies on success and failure factors for E-government benefit the research on smart city governance, thus showing the relevance of the topic.

The open government concept was practically unexplorable when comparing 9 out of the 10 publications. However, the study performed by Schmidthuber and Hilgers (2018) offers no conceptualization of open government in its solid or integrated state, but draws near the ideas that enable conceptual foundations. To the authors, the open government approach is suitable to the external environment during the proactive application, data accessibility, and support to the participative decisive process. Notwithstanding, open government would not be limited to the idea of making the process of decision taking participative or enable information, but to the capability of developing openings in administrative structures for the externalities by integrating government processes and bringing in cooperative services.

### Gaps and Insights for Future Researches

At this point, gaps and ideas for future researches are reported, starting from E-government and highlighting the need to continue with studies turned to E-government analysis, regarded by Norris and Reddick (2012), with the objective to observe the pace of their path and future impacts. The study identifies two gaps. The first one concerns the need for studies turned to the intention of use of service transaction (e.g., service request, public service bill payments), since such practices are difficult and expensive to perform. There is also the users' concern about not being attracted by such services. The second research gap lies on the issue concerning social media, since part of the governments have such tool but the impact they bring upon E-government is still not understood.

The research by Pina, Torres, and Royo (Pina and Torres 2010) assessed the capability that E-government has to affect the European Union's government liability, and pointed the continuous Internet development. Thus, future researches must update the results achieved. Likewise, other studies can be carried out by expanding the number of cases studied by country, including other types of public administration.

The contribution by Jun and Weare (2010) refers to the observance about the motivations to innovate in public organizations, to the changes along the process and how they influence the quality and efficacy of innovative practices in public management.

Based on the above, it was possible to see that there are a small number of approaches taken by open government in relation to E-government when the number of works defined in the study method is observed: E-government (70) and open government (22). In this sense, it is possible to conclude that this topic yearns for the development of new studies.

It is possible to see that the open government terminology is linked to the government's transparency and responsive capability. Therefore, the study by Mabillard and Zumofen (2016) indicates that new approaches can be developed for the

conceptual relationship between transparency and accountability. For example, the institutional contextualization is a factor that can promote comprehension about future researches. Likewise, other elements can be taken into account, such as political occasion, citizens' accountability, and reputation factors.

The study by Bearfield and Bowman (2016) shows the fulfillment of analyses and comparisons of the local transparency measurement by checking whether the information available in smart cities are capable to produce the act of monitoring and the public's capability to evaluate the local transparency. It also suggests the use of social media (especially Facebook and Twitter) as a way to reach public involvement and extent concerning transparency.

The approach by Oztoprak and Ruijer (2016) pointed out that few studies involve transparency in local governments. Thus, there are opportunities for researchers that are able to analyze impacts, weaknesses, and improvements caused by transparency policies in these governments.

Then, Schmidthuber and Hilgers (2018) point to the possibility of performing investigations in order to understand new collaborative services based on public and external agents' platforms, besides the maximization of practice participation practices and their improvements. There is also the suggestion to carry investigations in order to check how citizens contribute with initiatives and policies in the long run.

Other research suggest studies on citizens' behaviors in the public sector, for example, by identifying the individuals' attitudes toward the appearance of opportunities to participate in administrative processes or at the moment knowledge and experiences are capable to impact the government perception by the citizens. Another suggestion is similar to the way the public administration can capture good knowledge that comes from the external environment and integrate it into organizational processes in a more advantageous way (Schmidthuber and Hilgers 2018).

## Interfaces

The interfaces' analysis aimed at checking the relationship between E-government, open government, and other areas of knowledge by showing their contextualization and relevance (Table 8).

Concerning E-government, the study by Jun and Weare (2010) worked out on innovation by involving E-government and highlighting the institutional motivations for innovation and the development of E-government services offered through those sites.

The approach by Ganapati (2011), on the other hand, related e-governance with geographic information system (GIS), a technological tool to visually portray spatial information and to perform spatial analyses, allowing local governments to use web services, such as Google Maps, in order to give information on traffic and transportation. Google Transit is the main example for such use. Second, the Internet allowed a meaningful growth of voluntary geographic information; local agencies may use the local knowledge in order to increase the participation for several means. In other words, GIS made it possible for local governments to manage the relationship with the

**Open Government and E-Government: Concepts, Gaps, Interfaces, and Trends, Table 8** Interfaces between E-government, open government, and other areas of knowledge

| Approaches involving E-government | Authors | Approaches involving open government | Authors |
|---|---|---|---|
| E-government and innovation in public administration | Jun and Weare (2010) | Open government and learning, ways of accountability and their innovations | Schillemans et al. (2013) |
| E-government and geographic information system (GIS) | Ganapati (2011) | Open government and fiscal transparency | Deng et al. (2013) |
| E-government and citizens' trust in the government and the use of internet | Im et al. (2012) | Open government and citizenship and open innovation | Schmidthuber and Hilgers (2018) |

Source: Research data (2019)

citizens more efficiently. The citizens may report local problems online, which are sent to the right department.

Im et al. (2012) emphasized E-government and the use of Internet with citizens' trust in the government. From the premise that this information is a key factor in the public opinion and citizen's behavior, this research explored how the time the citizens spend on the Internet affect their trust in the government and the observance of policies, in comparison with the influence of the traditional, off-line, mass media, and newspaper modes.

Concerning open government, Schillemans et al. (2013) pointed to the issue about learning, accountability ways, and accountability and their innovations with open government. Due to the fact public accountability is linked to accountability, in a scheme that shares benefits and burdens because of the traditional reasons of how reliability and accountability can be approached, bureaucracy and shocks were created in the good governance, affecting the way accountability is done. Thus, with the introduction of alternatives for accountability, three types of innovations were created in order to complement the existing traditionalism: interactive accountability, dynamic accountability, and accountability started by the citizens.

Deng et al. (2013) related open government with fiscal transparency in the provincial Chinese government. The study's motivation encloses demands imposed in several parts of the world by asking for more transparency, in general, budgetary information from countries that are already developed (the United States, for example), as well as those from emerging economies (China, which is this study's objective). The study evaluated the level of fiscal transparency of 31 provincial Chinese governments between 2009 and 2012.

The approach taken by Schmidthuber and Hilgers (2018) related citizenship and open innovation with open government. The study analyzed the open government practices in Austria through citizenship projects, cataloging four examples of citizenship there: "App Challenge Tyrol '15," "MyLinz," "Digital Agenda Vienna," and "Lookalinz."

**Trend Analysis**

At this point, terms that are repeated in the studies are analyzed, as well as the relevance that shows the capability of relationship with the remaining terms.

Upon observing the most common terms (Table 9), it is possible to see that terms such as Government (68), E-government (58), Level (43), Participation (41), Citizen (40), and Transparency (35) are frequently cited in studies about E-government, which shows that citizen's participation, level, and transparency process in public entities are topics that are frequently explored.

As a complement to this understanding, Table 9 also presents the relevance of the terms, which shows that, despite the fact they have less hits, terms such as Internet (3.47) and ICTs (2.13) have a high relevance in studies on E-government since this is a topic that is very present in the technological environment. Terms such as Trust (2.66) also stand out, which shows the relationship of the studies on E-government application with information accountability, as studied by Im et al. (2012), who noticed that the citizens' level of trust in the government and conformity are affected by the citizens' use of Internet, and the term Accountability (2.13), approached by Pina, Torres, and Royo (Pina and Torres 2010).

After performing the analysis on E-government, there is the same observation strategy for open government. Upon checking the hits, according to Table 10, the most frequent term is transparency (41), followed by openness (17), information (16), and open government (12). All these terms are within the concept of open government, and the most expressive term, concerning transparency, can be understood as the open government's major objective.

Concerning term relevance, people (4.33), implementation (3.80), and quality (2.07) stand out and represent the main study focus on open government, which is the implementation process, population access to information, and quality generated by data openness.

By analyzing the terms that appear in the works on open government and E-government simultaneously, it was possible to see that the terms follow a trend: transparency, citizen/crowd, and

**Open Government and E-Government: Concepts, Gaps, Interfaces, and Trends, Table 9** Terms, hits, and relevance

| Term | Hit | Relevance |
|---|---|---|
| Government | 68 | 0.46 |

Source: VOSviewer® (2018)

information, for they are present in both research, which shows that both procedures have information transparency, social participation, and government information disclosure as the focus of their researches. Moreover, the two topics also present terms related to technology, such as Internet and ICTs, which shows that both E-government and open government use technology for their development.

## Final Remarks

Based on this study's findings, it was possible to see that the countries with the highest number of publications are the United States and Spain. The University of Granada and the University of Zaragoza, both in Spain, have the highest number of studies developed, with the authors Bolivar, Reddick, Royo, and Ingrams.

Concerning the concepts, it is possible to see that both tools have a relationship with transparency, social participation, and government information disclosure in their conceptual essence.

As research gaps, the topic concerning open government lacks more research in the area; studies that address the observance of transparency through the two topics are suggested; the use of social media for a stronger connection

**Open Government and E-Government: Concepts, Gaps, Interfaces, and Trends, Table 10** Terms, hits, and relevance

| Terms | Hits | Relevance |
|---|---|---|
| Transparency | 41 | 0.64 |
| Article | 20 | 0.32 |
| Government | 18 | 0.27 |
| Openness | 17 | 1.65 |
| Information | 16 | 0.28 |

between government and citizen, E-government path studies, the assessment of government accountability to the metrics of E-government and open government; innovation in public service through E-government; analysis of information capability disclosed by the government and whether they are capable of providing monitoring from the citizens; observation of the impacts, frailties, and improvements caused by transparency policies; validation of citizen's contribution to improvements and how they take place.

Concerning the interfaces, it is possible to see that the E-government topic agrees with the studies turned to citizen's access to public information, and the open government works to align transparency with government responsibilities. Both tools bring a higher responsibility and trust to management. They also introduce innovation processes into the public administration. Such interfaces are confirmed when the research trends are analyzed through the VOSviewer software, which leads to the conclusion that the topic interfaces of open government and E-government with other topics of knowledge area can be seen as research trends, that is, topics that are being studied as this analysis takes place.

From the conclusions presented, this work suggests an academic and scientific contribution in order to identify research concepts, gaps, interfaces, and trends in the area concerning E-government and open government. As for the

managerial contributions, the study collaborates with the identification of possible gaps and future efforts of studies which may take place empirically, thus contributing to the market.

This study's limitation lies on its generalization, since the study time period comprehended the years of 2009 to 2019, with data collection in the WoS taking place up to January 28, 2019. Therefore, the findings and suggestions for futures studies lie within the research limit established in the method.

## Synonyms

Information disclosure; Institutional trust; Open data policies; Political trust

## Definition

Open government data is freely accessible, nonprivacy-restricted, and nonconfidential data that public institutions make available without restrictions on its usage or distribution, in a standardized and machine-readable format.

Trust is the cognitive assessment of the relationship between trustors (citizens) and the trustee (public institutions) based on the expected utility of the latter performing satisfactorily.

## Introduction

Citizens in liberal democracies feel increasingly unconfident about their public institutions. Indeed, there is a general fall in trust during the last decades and, especially, since the Great Recession and sovereign-debt crisis. However, it is necessary to keep a certain level of trust to make the political system work, so that this loss of trust may have a negative impact on democracy and its legitimacy. Public officers, politicians, and academia are giving increasing attention to trust promotion and citizens' reengagement.

Open government data (OGD) is the basis of one of the most promising approaches. The implementation of open government data policies may lead to different positive outcomes, such as more transparent governments, the boost of citizens' participation, or the development of innovative and more efficient public services that are expected to increase trust in institutions. Accordingly, the Organization for Economic Cooperation and Development (OECD) and the European Union (EU), among other supranational institutions, together with different international organizations like Open Knowledge Foundation and Open Government Partnership, are encouraging national governments to adopt open data strategies in order to improve quality of democracy and promote economic development and, prominently, citizen trust in institutions. Consequently, it is of high interest for politicians, public officers, and academia to explore if the open disclosure of public data helps to bridge the widening gap between citizens and institutions.

## Institutional Trust

In a global context in which citizens are increasingly distrusting in public institutions, world leaders are seeking new strategies to reconnect with their citizens, by promoting a range of social public values through participation and collaboration (Bryson et al. 2014). Then, governments are moving to new management methods that are focused not only on economic efficiency, but also on other social, political, and ecological dimensions that create value for citizens beyond financial performance. The literature recognizes that trust is one of the potential benefits of this approach based on public values.

Trust is a link between a trustor and a trustee. In the context of this entry, the citizens are the trustors and the public institutions are the trustees. Trust in political institutions is a cognitive evaluation that the citizens make about that relationship in terms of what the trustors expect from the trustees (Bauer and Freitag 2018). This leads to the following question: how do citizens build trust in public institutions? People trust in a certain institution according to their past experience, after assessing public outcomes and processes associated to that institution. This reinforces the idea of approaching institutional trust as an indicator to study this relationship, as well as how

supportive citizens are toward their political and public institutions. It means that trust will reflect changes in how citizens perceive institutional performance but trust is usually more sensitive to bad experiences and poor performance than to positive ones, which is aligned with the popular belief that trust is hard to gain but easy to lose.

If institutional trust relies on experience it implies that one will trust others (individual or institution) if he or she is used to be treated fairly (Alesina and La Ferrara 2000). In other words, satisfaction and trust are closely linked, although it is necessary to study the causal relationship between both. Trust is the reflection of citizens' expectations about how different institutions will behave, while satisfaction measures how government and other institutions meet their current needs. More formally, this connection can be explained as follows: "trust is a future-based belief that politicians will be able to generate expected outcomes, whereas satisfaction is a retrospective view of outcomes generated by the government" (Weber et al. 2017). The causal and unidirectional impact of satisfaction on trust is widely supported by the literature and it is possible to state that trust assesses public institutions management and it also embodies citizens' satisfaction with public performance, since it quickly reacts to any changes in their satisfaction with government performance (Keele 2007).

When analyzing citizens' trust in institutions and their satisfaction, it is necessary to considered that they are complex measures. Regarding trust in institutions, there are different national institutions (national government, national parliament) and even regional or local governments whose performance can have a direct impact on citizens' daily life. At the same time, national institutions are losing their capacity to influence on different policies, especially in terms of economics, while this economic power is being transferred to other supranational actors, such as the EU (in case of the European countries) or the International Monetary Fund. This is quite relevant since, together with trust, another debate about legitimacy of certain institutions is rising. Concerning satisfaction, citizens' assessment on government or institutional performance may cover a wide set of aspects, such as democracy, economy, life in general, public education, or health services.

## Open Government Data as a Driver for Trust

Recent findings reveal that the digitalization process of governments and institutions is leading to a range of benefits linked to the public values mentioned above (Ruijer and Martinius 2017). The former implementation of Information and Communication Technologies (ICT) and e-government, together with the need for mechanisms and policies that increase citizens' trust, are encouraging public institutions to develop open government, an innovative governance method that relies on the availability of open data in order to promote transparency and interaction between government and citizens (Wirtz and Birkmeyer 2015). Succeeding in the implementation of those strategies requires open data policies, as international organizations are stressing, in order to improve democracy and welfare through transparency and accountability. OGD is commonly understood as data disclosed by governments and other institutions that can be freely accessed by all, reused, and shared.

Initially, governments conceived OGD merely as an expression of their intention to be more transparent. Increasingly, this is turning into a more concrete set of strategies and policies in order to foster accountability, participation, and co-creation of value between governments and citizens. Another potential positive effect of OGD is citizens' trust as the ultimate goal of an open government strategy. The novelty of consistent and coherent OGD strategies, together with a lack of global benchmarks or indexes to measure OGD implementation over a long period of time, results in the scarcity of studies that explore this relationship. Although limited, there is evidence that supports that the implementation of OGD initiatives is expected to have a positive effect on citizens' institutional trust, which is one of the prominent good governance results of open data (Meijer 2014).

There is a direct and positive impact of OGD on citizens' trust as macro variables referred to a

whole population from a certain country or region. Nevertheless, OGD does not have the same effect on all the citizens and there are significant differences when including social and demographic variables in this analysis. Thereby, for those who intensively use the Internet, this positive effect was higher than for the rest of the individuals. Indeed, since disclosing public data strongly relies on websites and information systems, it is reasonable to think that how frequent a person uses internet-based services will be relevant in deriving trust from open data. Similarly, as an extension of those Internet-access differences, the impact is lower for elders than for other age groups, because of the age gap in the digital divide (Gonzálvez-Gallego et al. 2019).

In addition to that, as stated in the previous section of this entry, there is a link between trust and satisfaction. There are evidences that show that perceptions of public performance have a positive impact on citizens' trust in institutions (Porumbescu 2016). But is it possible to extend this general relationship to the specific field of OGD? Has citizen's satisfaction with public outcomes a positive effect on citizens' trust through satisfaction? The answers to these questions are also positive. In fact, when governments give citizens the chance of accessing public data related to the past, they feel more satisfied with public services and economy. Citizens project this increase in satisfaction to future beliefs that lead to a rise in trust in institutions. However, the effect on OGD on trust mediated by satisfaction is lower than the direct one (Gonzálvez-Gallego et al. 2019).

## Conclusion

Citizens' trust is a major concern, since it has been continuously decreasing in most of the democratic countries. Politicians, public officers, and international institutions are looking for new management strategies that allow them to reengage their citizens and to avoid deeper effects that can erode the legitimacy of institutions and the democratic system. In this context, national governments and supranational institutions are promoting open government policies. The open disclosure of public data is the backbone of those strategies. Through them, governments expect to promote transparency, accountability, and citizens' participation with the ultimate goal of increasing citizens' trust.

OGD allows people to monitor governments' performance, which makes the government more trustworthy. At the same time, if they can access open data from governments, they show themselves more satisfied with economy, quality of democracy, and public services, such as the provision of health care and education. When satisfaction rises, citizens improve their expectations concerning that the government will meet their interests in the future, which is the conceptualization of trust. Then, OGD has both a direct and indirect effect, through satisfaction, on trust. Despite positive, these effects are still small and the adoption of this innovation is still in its early stages. This reinforces the idea that governments should plan, develop, and implement OGD understanding that it will generate benefits, not immediately, but in the long term.

Governments, citizens, and other stakeholders can expect higher effects of OGD on trust as they implement, spread, and use OGD tools and applications in the future. Results are promising and there is a large room for improvement, but all the stakeholders involved in open government must measure how they are progressing in order to promote strength and to improve some weaknesses. It is necessary to ensure, for example, that OGD increasingly reaches a higher number of citizens, regardless their age or social status. In this sense, international organizations, such as the OECD and the World Bank, together with other global initiatives like Open Government Partnership or Open Data Barometer by World Wide Web Foundation, are relevant for the development and promotion of common standards and assessment of national OGD strategies. Moreover, the commitment of national governments is key to succeed and they should conceive OGD, not only as a way to increase citizens' trust in order to preserve their status but also as an effective method to improve democracy and promote social and economic development.

Researchers must play an important role in the future of OGD as a mechanism to increase institutional trust. OGD must be monitored and studied in detail in the long term, going beyond the exploration of causal relationships and analyzing how this effect evolves in time. Also, the comparative effect of OGD on trust among countries, as well as how individual socioeconomic and political variables can affect the relationship between OGD and trust, deserves special attention from academia.

## Synonyms

Control of corruption; Environment; Open government; Rule of law; Social capital; Transparency

## Definitions

Open government deals with the transparency and dissemination of information of government thus encouraging civic participation and boosting economic prosperity. This study finds that open government also contributes to social capital and environment. However, mechanisms such as Rule of Law and Control of Corruption are conditions in mediating the two variables.

## Introduction

Transparency and civic participation are related to the recent hot-debated topic "open government." To define and to promote open government, practitioners and academics have been long

studying the effects, aftermaths, and cautions of the functions of open government. Institutions at the international level, like the Open Government Partnership and the Latin-American Network (*Red Latinamerica por la Transparencia* Legislativa), have already begun to create networks among government and civil organizations to encourage them to promote transparency by engaging with citizens to fight against corruption and to strengthen governance.

Meijer et al. (2012, p. 13) define openness of government as "the extent to which citizens can monitor and influence government processes through access to government information and access to decision-making arenas." Heckmann (2011, p. 1) states that "Open Government is about improving transparency, and thereby accountability, in all public affairs." As such, it can improve the opportunities of citizens to influence political decisions. The active engagement of citizens can bring public trust, decrease disillusionment with politics (Heckmann 2011), and improve the implementation and outcome of policies (McDermott 2010). In her famous TED-talk "Demand a more open-source government" in 2012, Beth Noveck articulates that the society should demand a more open-source government and foster civic participation and collaboration for a transparent society. Government produces public goods, such as education and health infrastructure, and provides these values and expertise to its citizens. The motivation behind open government is well explained and justified.

## Researches on Open Government

Open government has been researched in relation to economic prosperity, ICT, and politics. Economic development is probably the most basic way to improve the standard of living in a country. The information created by open government data uses technological infrastructure to enable the information flow to the public. By taking advantage of information dissemination citizens can influence political decision, detect corruption, and thus enhance government accountability (McGee and Gaventa 2011; Michener and Bersch 2013). However, open government cannot itself stimulate economic prosperity. Lindstedt and Naurin (2010) find that public conditions such as higher education and media reach are necessary for an open government to have a positive effect on the public. Krishnan proved that the mechanism of Control of Corruption fully mediated the e-government maturity on economic prosperity (Krishnan et al. 2013). His findings state that e-government itself does not have any significant effect on economic prosperity.

### Social Capital and Environment as Elements of Prosperity

Social capital has been studied among various fields such as education, public health, community life, governance, and democracy (Adler and Kwon 2002). It is closely associated with trust and network and has substantial effects beyond those of economic characteristic (Helliwell 2006). It is an important indicator of a community's success (Whitham 2012). If social network and trust is high, it creates an atmosphere, which increases the wellbeing of the citizens (Helliwell 2006). Moreover, social capital and democracy are interdependently related, meaning that social capital affects democracy and vice versa. Environment and nature have been considered as intangible benefits to the people which can enhance their happiness and health. For example, high air quality, ecotourism, agriculture, and nature conservation bring physical and social benefits to a community, which is indirectly linked to the happiness of the people. In his study, Krishnan had proven that e-government maturity has indirect effects on environmental degradation via Control of Corruption (Krishnan et al. 2013). The idea to include environment into the social dimension of prosperity has been brought to attention only recently. Given the evidence above and ongoing studies of people's perception toward nature in accordance to their happiness, this study includes the variable, environment. This study investigates whether Rule of Law and Control of Corruption work as a platform to bridge open government and prosperity of society. The two variables measure the confidence level of the public – confidence on the perception of social

order. Rule of Law measures the perceptions of agents' willingness to abide by the rules of society, police, and courts; the law enforcement of contracts and property rights; and the detection of crime and violence. Control of Corruption considers public power's detection of malpractices for private gains.

### What Is Open Government About?

From the various literature, several hypothesis can be inferred. Firstly, open government is positive related to prosperity. Open government secures the citizens' rights to information and thus improves accountability for disclosed information. Information itself enables citizens to formulate preferences among policy options, agencies to administer laws and regulations and government to engage in "the mechanisms of accountability that freshen democracy" (Bimber 2003, p. 11). Governmental institutions can post problems and expect innovative ideas and solutions from citizens. Informing citizens and collecting creative solutions from them have proven to be highly effective in some situations. Secondly, open government is positively related to prosperity with the mediating effect of Rule of Law and Control of Corruption. Krishnan has proven that the Control of Corruption is an effective mechanism when talking about the relationship of e-government maturity and economic prosperity and environment degradation (Krishnan et al. 2013).

Lastly, social capital and environment are positively related to open government. This research investigated whether prosperity aspects other than economical social welfare benefit from open government. From the previous literature, this study assumes that high social trust in the community will lead to a better life for individuals and increase their confidence and level of satisfaction.

Thus so far, open government has been associated with access to information, technology, and civic participation, which leads to anticorruption and economic welfare. This study finds that open government has an effect on prosperity; not only on economic welfare, but also on social welfare such as social capital and environment. The Open Government Index from the World Justice Project, which measures the publicized laws and government data, right to information, civic participation, and complaint mechanism, is the independent variable. The Prosperity Index, taken from the Legatum Prosperity Index, is the dependent variable and considers three dimensions – economic, social, and political – and is measured in nine pillars: economic quality, business environment, governance, personal freedom, environment, education, social capital, safety and security, and health. This research investigates whether publicized data, citizen's right to the information, and their engagement or interaction effect the flourishment and creation of wealth within a society.

Given the various literature of open government, two fundamental questions will be asked and tested. (1) Is open government directly associated with prosperity? (2) Is open government associated with prosperity through the two mediating effects: Rule of Law and Control of Corruption?

## The Model

Two models are formulated in this research. The first model is to investigate government transparency in 96 countries for the year 2015 by using Open Government Indicators as the independent variables. The second model is to investigate the effect of E-government development index from the United Nations on prosperity for eight consecutive years from 2008 to 2015 in the 96 countries. Both models will measure a direct effect of open government toward prosperity and an indirect effect through two mediating variables: the Rule of Law and Control of Corruption. Open government does not contribute to society unless mechanisms such as Rule of Law and Control of Corruption are put into practice effectively.

Figure 1 shows the overall research model measuring (i) the direct effect of open government to prosperity and (ii) the indirect effect of the open government to prosperity through two mediating variables.

Figure 2 shows the direct effect of the four Open Government Indexes to the nine prosperity

**Open Government influence on Social Prosperity, Fig. 1** Research model

**Open Government influence on Social Prosperity, Fig. 2** The relationship of open government to prosperity

indicators, and Fig. 3 shows the indirect effect through the mediating variables: Rule of law and Control of corruption. Figure 4 shows the model when using the E-government development index as the independent variable.

Archival data from the World Justice Project Worldwide Governance Indicators and Legatum Prosperity were used. The World Justice Project measures, in eight indexes, the extent to which a country adheres by the Rule of Law in practice. Among the eight pillars the study considered open government, which is measures the four pillars, as suitable for the research. The Worldwide Governance Indicators include six dimensions of governance: voice and accountability, political stability and absence of violence/terrorism, government effectiveness, and regulatory quality, rule of law and control of corruption. From the six indexes, the study considered rule of law and control of corruption as the mediating variables. (Rule of Law in the Worldwide Governance Indicators is different from the Rule of Law in the World Justice Project. The former reflects the perception of the agency to abide by rules of society and rights, whereas the latter is the general practice of a country to prevent corruption, wrong doing, etc.) The Legatum Prosperity Index measures the wealth creation and wellbeing of a nation across nine pillars from economic quality to governance, social capital, and environment. The study included all nine pillars in the study, since all of them represent a significant phenomenon in the community. The data have been used in numerous studies and it also provides other advantages such as easy reproducibility, the ability to generalize the results arising from large datasets. In total

**Open Government influence on Social Prosperity, Fig. 3** The relationship between open government and prosperity through Rule of Law and Control of Corruption

**Open Government influence on Social Prosperity, Fig. 4** The relationship of E-government index to prosperity through Rule of Law and Control of Corruption

96 countries were analyzed. (Afghanistan, Albania, Argentina, Australia, Austria, Bangladesh, Belarus, Belgium, Belize, Bolivia, Botswana, Brazil, Bulgaria, Burkina Faso, Cambodia, Cameroon, Canada, Chile, China, Colombia, Costa Rica, Ivory Coast, Croatia, Czech Republic, Denmark, Dominican Republic, Ecuador, Egypt, El Salvador, Estonia, Ethiopia, Finland, France, Georgia, Germany, Ghana, Greece, Guatemala, Honduras, Hungary, India, Indonesia, Iran, Italy, Jamaica, Japan, Jordan, Kazakhstan, Kenya, Lebanon, Liberia, Macedonia, Madagascar, Malawi, Malaysia, Mexico, Moldova, Mongolia, Morocco, Nepal, Netherland, New Zealand, Nicaragua, Nigeria, Norway, Pakistan, Panama, Peru, Philippines, Poland, Portugal, Republic of Korea, Romania, Russia, Senegal, Serbia, Sierra Leone, Singapore, Slovenia, South Africa, Spain, Sri Lanka, Sweden, Thailand, Tunisia, Turkey, Uganda, Ukraine, United Arab Emirates, United Kingdom, United States, Uruguay, Venezuela, Vietnam, Zambia, Zimbabwe.) For the independent variable, the Open Government Index from the World Justice Project (WJP) was used. The Open Government Index, which is the first effort to measure government openness based on the general public's experiences and perceptions worldwide, measures four pillars: Publicized law and data; Right to information; Civic participation; and Complaint mechanisms. The data for the two mediating variables are indicators from the Worldwide Governance Indicators: Rule of law and Control of corruption. The Worldwide Governance Indicator is a project from the World Bank Development Research Group. Finally, the dependent variable will be taken from the Legatum Prosperity Index, which is measured by nine pillars. The Legatum Institute is an international thinktank and educational charity and has the opinion that prosperity is the fundamental building block of human flourishing.

The measurement and definition of the variables are given in Tables 1, 2, and 3. A further detailed description of variables is in the Appendix.

Structural Equation Modeling (SEM) analysis was conducted with the two models as SEM can simultaneously analyze all paths in one analysis. All values are highly significant at the 1% level. The significance level is indicated by the p-level; if the p-level is under 10%, the coefficient is starred with *, if under 5% with ** and if under 1% with *** meaning that it has very high significance. Table 4 show the direct and indirect correlations of each of the four Open Government Index to each of the nine prosperity indexes. Table 5 shows the direct and indirect correlation of the E-government development index to each of the nine prosperity pillars.

From the numerous results, attention was drawn on the indirect effects of open government. In both Tables 4 and 5, all nine variables of prosperity show a significant and positive indirect effect via Rule of Law and Control of Corruption. Therefore, hypothesis 1 is rejected and hypothesis 2 supported. Open government showed significance and positive relation when introducing the mediating variable: Rule of Law and Control of Corruption. Statistical results show that social capital is not a significant or positive factor in any case of the four pillars of Open Government Index or E-government development index (Tables 4 and 5). Environment does not show significant levels toward open government, however, shows significant relation toward e-government (Table 5). Hypothesis 3 is partially accepted, because of the insignificant relation between open government and social capital and significant relation between e-government and environment.

## Conclusion

After having shown that open government and transparency is a topic of interest, the study results show attention-seeking findings. Open government is related to social capital and environment through the mediating effects of Rule of Law and Control of Corruption. This is a fundamental finding beyond previous literature, which asserts the positive influence of information dissemination on economic prosperity. Clearly, social capital and environment are factors that should be taken into consideration when discussing about a nation's wellbeing. For instance, the level of social capital will have much effect on a community's development project, if social capital of the community is managed by a capable

agency. Clear environment also contributes to the wellbeing of a nation, especially those who are highly dependent on ecotourism and agriculture. Many developed countries government has set up legislations and regulations to protect their national parks, which clearly states that government information dissemination and intervention is essential for controlling pollution and human impact on environment. The literature mentioned in Social Capital and Environment as Elements of Prosperity are evidence of the importance of social capital and environment and how

they are interlinked to the social wellbeing of a community. Furthermore, the four variables for Open Government Index (publicized law and government data, right to information, civic participation and complaint mechanism) are a more precise and accurate description of open government. Previous studies have mainly referred to e-government index or technology infrastructure when defining open government. However, this study has proven that open government is much more than that. It also involves engagement, interaction, and interdependency. Open government was defined through the four variables: publicized law and government data, right to information, civic participation, and complaint mechanism. However, open government can be defined differently depending on the context. There is a need to further define and set the boundaries of open government and its effects. Future studies using the prosperity index will be necessary to follow and record the patterns of the effects of open government on prosperity.

## Appendix

Variable description:

Independent Variable

*Publicized laws and government data*

The World Just Project regards this the first dimension to what they define as open government: transparent, accessible, participatory, collaborative, and responsive. According to Lathrop and Ruma (2010), the accessibility of government data is a precondition to open government, which is improving transparency and accountability of public affairs through which citizens have the opportunity to influence political decisions (Heckmann 2011).

*Right to information*

Right to information has become synonymous with democracy. With the diffusion of right to information law throughout Central and Eastern Europe, South Africa, and South America after the Cold War (Florini 2007) and the spread of the Access to Information law (Relly and Sabharwal 2009), the movement toward citizens' rights to information and information accessibility has become important. The law gives citizens the right to gain access to data and documents to trace actions and decisions made by the government. This allows them to detect corruption and hold the government accountable for the information it provides (McGee and Gaventa 2011; Michener and Bersch 2013).

*Civic participation*

Civic participation improves the realization of important democratic values (Macintosh 2008). Although there is a lack of scientific evidence to prove whether civic participation is directly related to a prosperous society, the objective of many organizations and studies indicates that open government leads to public participation and democratic societies (Di Gennaro and Dutton 2006; Hilgers 2012; Lathrop and Ruma 2010).

*Complaint mechanism*

The last condition for an open government is the complaint mechanism implementation between the public and government. The public must raise their complaints and their voices and government must respond to the citizens' requests. The purpose of the mechanism is that the public is not only provided with data, but can give feedback to the government so that their opinion is reflected in the process.

Dependent variable

*Economic dimension:*

*Economic quality*

Stable and high-quality economic fundamentals, such as accounting reports, increase

economic wealth which promotes social wellbeing. The economic quality pillar measures the countries' performance in four key areas: structural policies (e.g., trade barriers), economic satisfaction and expectations (e.g., satisfaction with living standards), distribution of prosperity (e.g., relative poverty), engagement (e.g., labor force participation and financial access), and production quality and diversity (e.g., export diversity and quality).

*Business environment*

In a good and strong business environment, citizens have the opportunity to pursue innovative ideas to improve their lives, leading to more wealth and higher social wellbeing. The business environment measures how well people have access to infrastructure, such as the Internet, transport, and credit, and how comfortable people are with the idea of starting their own business. Bittencourt (2011) proved that financial development indeed played an important role in generating economic growth, economic activity, and innovation in the region.

*Institutional dimension:*

*Governance*

A well-governed and democratic society has a high level of citizen wellbeing because of assured political and economic freedom. Governance measures the effective and accountable government, fair elections political participation, the rule of law, and the level of a country's democracy. It also assesses levels of government corruption and competition, and citizens' confidence in the honesty of elections and the broader policymaking process.

*Personal freedom*

According to the Legatum institute, a society experiences high levels of income and wellbeing when its citizens enjoy freedom of expression, belief, and organization, as well as personal autonomy in a diverse society. This pillar measures the freedom of a country's social tolerance. It captures the importance of various freedoms – of choice, expression, movement, and belief – and tolerance of minorities and immigrants, which enhance a country's wealth and the wellbeing of its citizens. Societies that foster strong civil rights and freedoms show increases in levels of citizen satisfaction.

*Social dimension*:

*Health*

A strong health infrastructure enables citizens to enjoy good physical and mental health. Strong mental health leads to higher levels of economic prosperity and wellbeing, whereas poor health keeps people from fulfilling their potentials. The health pillar evaluates countries based on indicators of strong health infrastructure (rates of immunization and sanitation facilities), life expectancy and mortality rate, and individual satisfaction with health. It is reported that self-reported wellbeing and health are strongly and significantly correlated to a society's overall health, further fostering human capital creation, which leads to higher economic development.

*Safety and security*

Safety and Security measures the national security, personal precariousness, and personal safety of a country. A stable social and political environment at a national level is measured by the political terror scale and its investment for sustaining economic growth. Academic research shows that organized political violence, such as crime, hinders economic growth (Cho et al. 2016; Guiso et al. 2004). When individual citizens worry about their personal safety their overall wellbeing suffers. In addition, an environment of fear and uncertainty negatively affects life

satisfaction. (Personal safety measured through questions such as "Do you feel safe walking alone at night?)

*Social capital*

When people trust and respect one another, the social network and the cohesion of a society has a direct and positive effect on the prosperity of a country. Social Capital measures a countries' performance in three areas: social cohesion and engagement (bridging social capital); community and family networks (bonding social capital); and political participation and institutional trust (linking social capital). Empirical studies on social capital have shown that citizen wellbeing improves through social trust (Helliwell 2006). Similarly, societies with lower levels of trust experience lower levels of economic growth (Guiso et al. 2004). Thus, the word "capital" in "social capital" highlights the contribution of social networks as an asset that produces economic returns and improves wellbeing.

*Environment*

Environment has been recently added to the Prosperity Index. The Legatum Institute has found that several indicators of the environment, including the use of pesticides, and land and marine areas devoted to nature, and air quality, show a significant relationship with average national wellbeing and material wealth. A high-quality environment may bring a sense of wellbeing and satisfaction to a country's population, whether it is physical, such as air quality; social, such as green areas and recreation; or symbolic such as national parks. Agriculture, eco-tourism, and nature conservation also provide economic benefits making a high-quality environment an important measure linked to economic and social prosperity.

## Synonyms

Collaboration; Crowdsourcing; Innovation; Open data; Open government; Open source; Public open innovation

## Definition

"Open Innovation involves a business model that combines internal and external knowledge to create value for the organization."

## Introduction

Innovation is critical to success and growth, be it for business organizations or nations. Global competition, rapid developments in technology, changing economic landscape, and increased expectations of people put pressure on businesses to constantly redesign and reinvent products, services, and processes to stay relevant. At a national level, innovation is a key driver of economic growth and development since it spawns opportunities for new businesses, new jobs, productivity gains, and rise in incomes. Economies ranked high on innovation were found to score higher on productivity, resilience, adaptability to change, and living standards (OECD 2015). In the twenty-first century, with knowledge and resources becoming globally accessible, the focus shifted from innovation *per se* to staying ahead through accelerated innovation.

A brief review of the meaning of innovation shows that it is the transformation of new ideas into economic and social solutions. Innovation is a new or a better way of doing something, but it is not just anything novel. It has to lead to increased gains either for the organization or the users or both. It can be a new product, a new service, a new process, a new practice, a new structure, or a new method, which creates economic and social benefits to the actors.

The term open innovation has been coined by Henry Chesbrough (2003) who based his thesis on the study of the practices of business organizations like IBM, Xerox, Cisco, Lucent Technologies, Linux, and so on. He postulated that, open innovation involves integration of a two-way flow of knowledge which is purposefully and intentionally pursued by a business firm. Organizations actively seek creative contribution of other organizations, communities, and individuals and in turn share their knowledge and expertise with the aim of jointly creating enhanced value for the firm. He further stressed that such an integration of the inward and outward knowledge flows is central to its business model and the interactions act as a fountainhead of value created by the firm. A business model constitutes the value offered by the firm and the value received by it in the process of exchange. The value offered is in the form of products and services, and value received can be revenues generated through the sale of such products and services.

Thus the key dimensions that define open innovation as conceived by Chesbrough are:

1. Integration of internal and external knowledge
2. Initiated by the innovation seeking organization
3. A source of creating value that is central to its business model

### Conceptualization of Open Innovation

There have been several iterations of the definition of open innovation based on the growing discourse and research on open innovation. In the most recent version put forth by Chesbrough and Bogers (2014), open innovation was defined as:

> a distributed innovation process based on purposively managed knowledge flows across organizational boundaries, using pecuniary and non-pecuniary mechanisms in line with the organization's business model.

In addition to the internal sources, the external sources of knowledge that a company taps into include consumers, supply chain partners, enthusiasts, universities, or communities of interest. The organization's strategy is to build a network of knowledge sources, in which members voluntarily participate for collaborative innovation. While the innovation seeking organization profits from open innovation, the innovation providers may or may not benefit financially from it. End-users as contributors will gain from improved products and services, supply chain partners like suppliers and distributors may reap the rewards of sustained business, but other individuals who participate out of interest may do so for the satisfaction of participating and contributing with no financial returns. The innovation-seeking organization fosters a conducive ecosystem in which the interactions between participants inspire innovation. However, the true spirit of open innovation embodies a mutual exchange – providing access to resources and technology developed in-house for use by external actors as well. For example, P&G Connect & Develop, the open innovation platform of Procter & Gamble (P&G), receives more than 300 innovations every month. With the promise of "partnering for mutual value," P&G's version of open innovation involves "the practice of accessing externally developed intellectual property and allowing internally-developed assets and know-how to be used by others." While the P&G model involves contractual obligations with the shortlisted innovation solution providers, others like Linux operating system, Wikipedia, and social networking sites such as MySpace, LinkedIn, Facebook, YouTube, etc., rely on external actors to create value and allow access to all without formalized licensing or collaboration schemes.

The usage of the term "open innovation" varies widely which leads to considerable haziness around the terminology. Widely witnessed in the software field, open source refers to the practice of making the source code freely available for study, use, modification, or distribution by others. Such access without restrictions helps all interested competent individuals or entities to benefit from and make their own improvements to the software. Continuous augmentation by anyone from anywhere benefits the entire community, including the original developers, in the form of rapid and collaborative innovation. Consequently, open source quickly evolved into a philosophy of open exchange with no licensing charges to facilitate collaborative effort for the common good. On the contrary, open innovation is also used while referring to a firm's sharing of proprietary assets with its supply chain partners, despite the commercial nature of such exchange. Some others use it synonymously with outsourcing (the firm contracts some of its functions to be performed by external partners) or crowdsourcing (organizations seeking solutions from the public).

Chesbrough's version of open innovation (2011) involves "many other actors that fall far outside traditional supply chains (such as universities or individuals), and these participants in open innovation can be influenced, but often are not actually directed or managed." His focus is on the business model that dictates the knowledge flows which create value to the organization and its stakeholders rather than the actors involved or the protection of intellectual property. He also identified *five distinguishing characteristics* of open innovation:

1. Networking
2. Collaboration with external individuals and organizations – partners, competitors, universities, research institutes, and end-users
3. Corporate entrepreneurship – investing in new ventures, funding start-ups, and spinning-off innovation function of the existing business into a new entity
4. Proactive Intellectual Property Management – facilitating exchange in intellectual property and creating markets for technology
5. Research and development (R&D) that is aimed at gaining competitive advantage in business

Thus, companies source external knowledge from wherever it exists and apply their own expertise and skills to convert the ideas into commercially successful products. The innovation seeking

organizations may be supported by intermediaries in such innovation who either aggregate creative knowledge or provide a platform for connecting diverse creative sources or facilitate sharing through other means, as can be seen in the example in Box 1.

**Box1 An Example of an Innovation Intermediary**

**Creative Commons (CC)** is a nonprofit organization that issues copyrights and licenses free of charge to enable a simple and legal way of knowledge sharing. Their affiliate network spanning more than 85 countries is represented by over 500 individuals including researchers, activists, legal professionals, educationists, policy advocates, and volunteers. They collaborate with nongovernmental institutions, universities, and public agencies to copyright intellectual property that helps solve local and global challenges. Their aim is "to build a more equitable, accessible, and innovative world" by increasing "the body of work freely available for legal use, sharing, repurposing, and remixing." Through the use of CC licenses, millions of people around the world share their creative works like photos, videos, writing, or music for use by any member of the public.

## How Is Open Innovation Different from the Traditional Approach?

Traditional model of confining innovation within the organizational boundaries is known as closed innovation. Since innovation has become critical for sustaining competitiveness and growth of organizations, the dominant philosophy was to hold exclusive rights to the innovation in the form of intellectual property rights (IPR) ownership. IP laws allow organizations a specified time frame to recover the investments they made in R&D and hence provide an incentive for innovation. Consequently, firms intending to protect their IP are highly secretive of their innovation agenda and process and fiercely compete with other firms in attracting talent. Firms that have greater resources can acquire better talent and benefit from the fruits of innovation, thus creating a virtuous cycle for themselves. Open innovation, on the other hand, aims at leveraging mutual knowledge for reciprocal benefit. Open innovation also requires firms to redesign R&D processes (at least partially) to incorporate two-way knowledge flows. It is the ecosystem in which all members have access to each other's inputs but no one has exclusive rights on the innovation that ensues. Such innovations are similar to public goods which are non-rivalrous and nonexcludable: non-rivalrous, since one individual consuming it does not reduce its availability to another individual, and nonexcludable, which means that it is available to all and no one has exclusive rights. Besides the open source software such as Linux, social networking sites like Facebook, Twitter, and LinkedIn enable mass collaboration for knowledge creation and sharing without constraints. Organizations usually use a combination of both open and closed innovation approaches by partially opening up their innovation for inclusion of external parties even while undertaking some innovation behind closed doors.

## Tracing the Evolution of Open Innovation

As discussed above, the traditional model of innovation, widely prevalent till about the 1980s, was a closed model in which the mandate for innovation rested with the organization's in-house R&D department. Practices such as outsourcing and offshoring of production and technology acquisition from external sources, known as externalization, were a growing trend in the 1990s. Gradually scope of externalization broadened to encompass innovation as well by the turn of the twenty-first century. The distinctive feature of externalization of innovation when compared to outsourcing of production is the change in power dynamics between the manufacturer and suppliers. As outsourcing partners, the suppliers had far less power and were dependent on the manufacturers. However, as innovative suppliers developed expertise in new technologies, their clients gained

significantly from the increased scope of products, services, and technology (Granstrand et al. 1992) which led to greater mutual dependence. Subsequently, firms recognized the benefits of collaborative efforts among supply chain partners for radical innovation. Firms began to engage in systematic planned interactions and developed networks with external partners, as co-creation as a strategy for innovation gained currency. Other developments such as technology-enabled global connectivity and access, mobility of knowledge workers, growth of social networks, and availability of venture capital led to a much wider geographic dispersion of knowledge and spurred grassroots entrepreneurship. This led to democratization of innovation, and large firms were no longer the chief custodians of innovation. Businesses have effectively turned this threat into an opportunity by drawing the individuals and communities into their networks of innovation. Thus, open innovation ensues from the interactions of various actors – internal and external, private and public, and individuals and organizations – as well as intermediaries who facilitate such interactions.

## Adoption of Open Innovation in the Public Sector

Though open innovation was conceived by Chesbrough in the context of business, it gained widespread adoption across several disciplines and fields of practice – each changing the contours to fit their own requirements – which include the not-for-profit sector, public sector, governments, social groups, and communities.

Innovation has become an imperative for transformation of public sector organizations. They needed to change their bureaucratic and paternalistic ways to proactive, responsive, and citizen-centric style of governance in order to gain greater legitimacy for their public value creation processes (Bekkers et al. 2011). Moreover, the magnitude and complexity of problems that need to be tackled by the public sector – environmental degradation, migration, cultural shifts, or security threats to name a few – need collective action and cannot be addressed by a single entity. A number of governments are exploring the usefulness of open innovation to collaboratively develop and implement solutions to deal with these complex challenges through stakeholder engagement. Known as public open innovation (POI), this strategy also promises a more inclusive, bottom-up approach of governance and a means of capitalizing on opportunities generated by digital technologies (Bakici et al. 2013). However, given the differences between the public and private sectors, the nature of value and the participants might vary. Private sector's focus is on value creation for greater competitiveness and greater revenues. In the public sector, the goal is to improve the public value and service performance which will ultimately benefit the public.

## Select Modes of Public Open Innovation

The practice of POI is on the rise and the modes adopted continue to evolve. A few of the common modes are discussed below. Though these modes *per se* are applicable to business and other sectors as well, the examples pertain to the public sector.

*Living labs* are innovation ecosystems that facilitate user-centric open innovation grounded in insights from real-life settings and communities. In the context of POI, living labs function as intermediaries that forge public, private, and people partnerships (PPPP) for collaborative solutions. For example, the European Network of Living Labs (ENoLL) facilitates co-creation, user engagement, and test and experimentation for innovation across multiple domains such as energy, media, mobility, healthcare, agrifood, etc. Originating in Europe, it expanded globally as a platform for exchange of best practices, learning and support for more than 130 active Living Labs members from 6 continents (https://enoll.org).

In the larger context of cities, living labs are also termed as "City Halls" since the city itself is an ecosystem in which the city stakeholders collaborate to develop and test solutions. City halls signify a departure from a technology driven, top-down approach to a bottom-up approach with citizens actively taking part in solving their own problems. This has been used especially for smart city initiatives.

*Open Government Data (OGD)* is the sharing of large sets of data and content in the public domain by the government for free access, use, modification, and distribution by anyone for any purpose. It is both a philosophy and a set of policies aimed at promoting transparency, accountability, and value creation. It also provides opportunities for business generation and development of innovative, citizen-centric services. For instance, information freely available under OECD OGD analysis includes social data, public tender databases, and information related to business, registers, patents and trademarks, geographic, legal, meteorological, and transportation (www.oecd.org).

*Crowdsourcing* involves sourcing ideas from the public in order to benefit from the collective intelligence, knowledge and creativity of the people. The innovation seekers leverage the wide reach of the Internet and social media usually through contests, games, and micro tasks.

*Hackathon* is a short duration gathering of computer programmers and other experts – including graphic designers, interface designers, project managers, etc. – who work intensively during a short time frame to develop a new program or to improve existing software (refer Box 2).

**Box 2 World's Biggest Open Innovation Model**

Smart India Hackathon (SIH) is an annual nationwide initiative that invites students to solve some of the challenges faced within the public sector, ministries, industry, as well as nongovernment organizations. Recognized as the world's biggest open innovation model, the 2018 Hackathon received more than 17,400 entries from around 100,000 students pursuing engineering, management, and computer application courses from across the country. Award-winning solutions include intelligent water-level monitoring in bore wells, temperature control of motors, digitizing ticket checking system and efficient public address system for railways, ambulance tracking system, and an Android application for safe driving to name a few. In SIH-2019, over 100,000 students from around 3000 institutions are expected to participate.

Source: http://openinnovation.net

POI is a growing phenomenon as more and more governments realize the immense benefit of tapping into the creative potential of various external partners and communities they serve. We can argue that POI is true to the spirit of open innovation even more than its corporate sector counterpart. Ethical questions are raised with respect to open innovation in the business sector (Ettlinger 2017). Businesses profit from the collective creativity without payment, which tantamounts to free labor, though the contributions are voluntary. Such voluntary contributions are labelled as self-enrollment in the new mode of exploitation (Graham 2014) since the innovation providers may or may not profit from the innovations they contributed to. However, when applied in the public sector, the goal is a common good. The innovation benefits large sections of the society in the form of improved services that are provided to the society. Despite Chesbrough's defense that open innovation is meant to be the business model and philosophy, the ethical issue still remains since the aimed outcomes have a commercial outcome, unlike the public sector. POI is also encouraged by the World Bank which is actively supporting the approach and philosophy in the programs funded by it across various countries for sustainable open innovation in government for application in cities and beyond (Sustainable Open Innovation in Government: Practical Application in Cities and Beyond 2016).

## Challenges of Public Open Innovation

Adoption of POI is not without challenges. One of the most important issues, which is witnessed in any community initiative, especially on online communities, is attracting and then sustaining the involvement and participation of communities. Further, open innovation requires a clear agenda, a well laid-out but flexible road map,

and capability to manage large-scale participation. Eventually, the success of innovation lies in its implementation and institutionalization. If the public sector fails to implement effectively and the benefits of such innovation are not clearly experienced by the people, it could actually become counterproductive and lead to disillusionment and even worse, apathy for future endeavors. Thus, the success of POI lies in the public sector's ability to harness innovation and convert it into effective solutions that improve the lives of the people they serve.

# Operational Leadership

Joseph Wallis
Department of Management, American University of Sharjah, Sharjah, UAE

## Synonyms

Administrative leadership; Leadership in public organizations

## Definition

Operational leadership seeks to advance initiatives and exercise influence in the implementation and technical aspects of policy development.

## Introduction

In considering public sector operational leadership (PSOL), this entry focuses on public servants as administrative rather than political leaders who are primarily engaged in the implementation and technical aspects of policy development. In an update of his 2003 review of the literature on this form of leadership, Van Wart noted an "enormous quantitative improvement in both articles and books devoted to the topic, as well as a far greater self-consciousness of the subfield" (2013,

p. 534). This has corresponded in many countries with a marked increase in the incidence of "leadership" language in official public administration documents as well as the growing investment in leadership development programs for public officials. For example, in the UK, Wallace et al. (2011) interviewed senior staff in four types of public organization in the UK and found that "Almost without exception, (they) confirmed their strong identification with being a leader in their organizations. . . .Informants generally believed that being a leader was a core component of their role (p. 80)."

This entry will attempt to make sense of this growing emphasis on operational leadership and role identification with being a leader in the public sector by firstly asking the question of what it means to exercise leadership in this context. It will then deploy a public service bargain framework to explore the enabling and inhibiting role of different reform regimes in terms of the role identities within which public servants can exercise this type of leadership.

## Operational Leadership as a Trust-Building Activity

The literature on the subject of leadership is vast. It spans multiple disciplines and has spawned a bewildering diversity of competing perspectives on this phenomenon. A contemporary divide appears to have emerged between essentialist and relational theories of leadership (Bolden and Kirk 2009). Essentialist theories view leadership as residing in the personal qualities or "traits" of leaders, the behaviors they demonstrate in particular situations, and the scope of the changes they effect on organizations and their underlying cultures. By contrast, relational theories find leadership in relationships of emergent co-ordination and change in which there can be an alternation of leader-follower roles.

Both perspectives can shed insight into the ways public servants exercise leadership through actions that emerge from interpretations of what they should or should not do within the boundaries of discretion inherent in their roles. Within any context leadership can be distinguished from managerial actions in that they are based on judgments about "the right thing to do" rather than "doing things right" and use informal authority to influence the commitment of other actors to a shared purpose.

This entry will suppose that the roles within which public servants can exercise PSOL include those of "bureaucrat," "organizational change agent," and "boundary-spanner." For each role the boundaries of leadership discretion can arise from what Christopher Hood and his collaborators call "public service bargains" (PSBs). Hood (2000) defines these as "any explicit or implicit understanding between (senior) public servants and other actors in a political system over their duties and entitlements relating to responsibility, autonomy and political identity, and expressed in convention or formal law or a mixture of both" (p. 8). A distinction can be made between *discretionary* and *adaptive* PSOL. Discretionary PSOL can be said to be exercised when public servants act within the scope of discretion inherent in the trusted role identities established through prevailing PSBs. By contrast, senior public servants can be said to be exercising adaptive leadership when they test the boundaries of trust implicit in prevailing PSBs and seek to go beyond and perhaps add a layer to established role identities.

A number of propositions can be made about how government reforms and PSOL interact to establish the contextual boundaries for these forms of trust-building administrative leadership:

(i) A "guiding reform regime" can be said to prevail where a series of related public management reforms provide direction to the discretionary leadership activities of public servants by emphasizing the role identities in respect of which they can build trust by exercising such leadership.
(ii) By building trust in this way, public servants may also develop the confidence to exercise adaptive leadership by testing the boundaries of trust to see if political leaders are willing to trust them to exercise leadership according to new role identities.

(iii) Public service bargains come to prevail when political leaders validate the discretionary and adaptive leadership activities of public servants. They thus reflect mutual understandings about responsibility and role identity between both types of actor.
(iv) Political leaders can play a more directive role in this process when they intervene either to rein back public servants where they have over-reached themselves in exercising adaptive leadership or by removing the barriers on their exercising leadership in new directions.

The dynamics of this process will now be considered with respect to how discretionary and adaptive leadership can be pursued in relation to the various role identities produced by evolving PSBs.

## The Opening of Paths to PSOL in the Bureaucrat Role Through Weberian Reforms

In countries where the relationships public servants have with political leaders are based on personal loyalism, the trust accumulated in such relationships will vary from official to official so that there will be negligible trust in their role of being a public servant, *per se*. Such trust can be developed through a "Weberian" guiding reform regime that allows public officials to build trust by demonstrating that they can comply with a rule-based system of external controls. Legislation could be enacted to, for example, require public servants to be tenured officials recruited on merit with their pay scales and pensions set by a statutory body and with the assurance given them that elected politicians cannot remove them from office. This was, of course, the well-worn path followed in English-speaking countries in the Progressive Era but, according, to Schick (1998) it is the necessary first stage in trust-building process of administrative development.

Reforms are, however, insufficient in themselves to develop trusted role identities for public servants. They can only point them along paths along which they need to exercise leadership to establish these identities. Public servants may thus have to exercise discretionary leadership to institutionalize a Weberian regime by developing a detailed set of rules and regulations to govern the behavior of officials in their own departments. In doing so they will need to model and promote values and principles consistent with ideal-type of the ethical administrative leader associated with this reform regime. Among these are the values of precision, stability, reliability, probity, predictability and, above all, fairness in both its vertical and ethical dimensions.

To the extent that they are able to establish a trusted bureaucrat leader role identity (LRI), public servants may also start to test its boundaries through adaptive leadership. For example, they may seek to layer an advisor LRI on to that of a bureaucrat LRI. Opportunities to do this would arise to the extent that their departments have been developed into repositories of knowledge with resources of technical expertise accumulated through the recruitment and career development of professional officials that can be drawn on to advise political leaders in the implementation and evaluation of public policies.

Through repeated validation by political leaders of the adaptive leadership their public servants exercise as advisors, senior public servants will come to be trusted as politically neutral partners in policy-making. The type of PSB described by Bernard Schaffer (1973) in which senior public servants offer their discretion and neutral expertise in exchange for privileged access to the counsels of their political leaders can thus emerge. Such Schafferian PSBs were not only the traditional form such arrangements took in Westminster style democracies but have also been observed in other political systems where top civil servants were not just "career bureaucrats" but also "the primary policy advisors to their ministers" (Bourgault and Van Dorpe 2013).

Two factors would seem to place such bargains under strain. On the one hand, public servants may come to be seen as exercising excessive influence over policy due to their privileged access to Cabinet deliberations and the information asymmetries that arise from the concentration of area-specific expertise and advisory capacity in

their departments. On the other, they may be inhibited by Weberian rule-based systems from exercising adaptive leadership in the operational sphere. Thus, even although they may have established trust in their capacity to administer external controls, they may be inhibited in a quest to improve operational effectiveness by shifting "from *ex ante* control to *ex post* audit, from control of individual actions to control within a broad band, from reviewing specific actions to reviewing systems" (Schick 1998, p. 130). A change in reform regime may thus be required to both rein in advisory and enable operational leadership by public servants.

## The Opening of Paths to PSOL in the Organizational Change Agent Role Through "New Public Management" Reforms

Under a New Public Management reform regime the leading role public servants play in policy advice tends to become more circumscribed as larger departments are disaggregated into policy advice and service delivery units and as Ministers come to rely increasingly on alternative sources of advice. At the same time, greater scope is allowed for public servants to exercise operational leadership in their departments through a program of reforms designed to, inter alia, (i) restructure large multi-purpose public organizations into smaller units that can be focused on delivering outputs as specified by Cabinet ministers, (ii) replace the permanent tenure of government officials with shorter contracts whose renewal are made contingent on meeting explicit performance targets, (iii) empower the executives at the head of government organizations with the discretion to deploy resources to efficiently deliver these targeted outputs, and (iv) require and regulate competition in the delivery of public services.

Such a shift in reform regime would redirect the leadership activities of managers so that they have the discretion act as change agents within their organizations. They could, for example, redeploy and, in some cases, lay off redundant staff. They could also introduce accrual based accounting systems and internal controls and restructure their organizations to focus on their "core business." Through a combination of both discretionary leadership and NPM-type reforms a stable managerial PSB where senior public servants are trusted to exercise leadership in their managerial LRI.

Once this PSB has been established, public servants can exercise adaptive leadership to test the boundaries of trust by auditioning the role of a *cultural transformer* as they interpret their leadership challenge as being to move from structural change to that of cultural transformation through follower engagement in their organizations. They can then bring together a change coalition to formulate a leading vision of what their organizational cultures can become and engage followers to model the ways of the new culture in the face of potential resistance from groups who they perceive as having a vested interest in preserving the status quo (Kotter 1995). This is, of course, easier said than done. It raises questions about the autonomy of administrative relative to political leaders in the formulation of this vision and whether the vision integrates or simply conceals and suppresses the values conflicts provoked by the change process. It may also be difficult to limit the pursuit of this vision to their own organizations so that senior public servants may try out a *boundary-spanner* identity as they seek to build collaborative networks with other organizations and actors who share a commitment to (or at least can be given some interest) in its advancement. In addition, where there has been a diminution of their advisor role, senior public servants may push back against this tendency by asserting the special competence they can bring as *stewards* bringing a long-term perspective that seeks to balance out over time the values affected in path-dependent policy processes.

While political leaders may limit themselves to simply validating this type of adaptive leadership where it occurs, they may intervene in a more top-down fashion to enable or encourage public servants to build on their LRIs in these ways. This approach has been characterized by some scholars as a "Post-NPM" reform direction (see Christensen and Lægreid 2012).

## The Opening of Paths to PSOL in a Range of Role Identities Through Post-NPM Reforms

A "Post-NPM" reform direction has become apparent in countries like the UK, Australia, and New Zealand which, for more than a decade, have been seeking to revise rather shift away from the NPM reform regime through a pragmatic process of "rebalancing" their administrative systems (Christensen and Lægreid 2012). Some aspects of NPM have thus been preserved, or even enhanced, while other aspects have been corrected drawing from ideas associated with public value management (Moore 1995).

The corrective aspects of Post-NPM reforms have primarily sought to revise the tendencies toward excessive vertical and horizontal specialization under a NPM reform regime. New structures and frameworks have thus been designed to strengthen the capacity of the center to achieve greater co-ordination through a "whole of government" vision and ethos. Certain control agencies or departments may be explicitly charged with a "guardianship" role over the whole public service, but public servants in general are increasingly expected to show leadership as stewards of values that are distinctive to the public service.

Post-NPM reforms have also involved the structural reintegration of some government organizations and the creation of cross-sectoral bodies, programs, or projects to demonstrate the "public value" of more networked governance and ameliorate the "siloization" of the public services. The exercise of boundary-spanning leadership by public servants has thus become discretionary rather than adaptive within these structures.

There are also certain aspects of Post-NPM that reinforce and strengthen paths taken under NPM. In particular, the emphasis on operational excellence may be amplified. Rather than simply holding managers accountable for the efficient delivery of "outputs," reforms may be introduced to encourage them to take responsibility for creating publicly valued "outcomes." Public servants have thus been given the discretion to exercise discretionary leadership within cultural transformer and boundary spanner LRIs. They do this as they act to align internal culture and external networks with the social outcomes or "public value" achievable through the advancement of their organization's leading vision.

## Conclusion

PSOL should not be seen as an activity that only comes into its own at an advanced stage in the evolution of PSBs. What this entry has sought to show is that administrative reforms have always had an enabling as well as a restrictive function with respect to this type of leadership. However, through the interaction of guiding reforms and a combination of discretionary and adaptive leadership by public servants PSBs can evolve in a way which opens up paths for these actors to exercise operational leadership across a greater range of role identities.

# Opportunistic Behavior in Public Procurement

Andrei Yakovlev, Andrey Tkachenko and Yuliya Rodionova
National Research University Higher School of Economics, Institute for Industrial and Market Studies, Moscow, Russia

## Synonyms

Corruption; Opportunistic behavior; Procurer; Public procurement; Supplier

## Definitions

Opportunistic behavior in public procurement is defined as a dishonest act or behavior violating the rights and interests of contractual counterparts.

## Introduction

During the past few decades, many developing countries have initiated public procurement reforms. One of their prime objectives was to limit corruption, enhance competition, and reduce the scope of procurer opportunism. However, radical changes in regulations have resulted in the emergence of new opportunities for opportunism this time on the supplier side.

Overpricing compared to the average market prices may be used as an indicator of opportunistic behavior in public procurement. However, this approach to detect opportunism is only valid in the case of procurement of homogeneous goods. In regard to the procurement of more complicated products, overpricing may occur not only due to suppliers' opportunistic behavior but also due to suppliers' reputation or contract delivery guarantees. The imperfect regulatory environment is an additional factor impeding the identification of dishonest behavior. It complicates the principal-agent problem, as inadequate regulation forces even benevolent agents to violate the rules. As a consequence, the principal's control and detection of dishonest agents becomes more difficult. Hence, there is a need for new approaches for the identification of potential opportunism.

This chapter offers a methodological approach for principals aimed at identifying potential opportunism by counterparts that are linked with agents through contractual relations. When the rules are inconsistent with reality and unfeasible for agents, the principal is unable to identify dishonest agents on the basis of the available information. The authors suggest employing a counterpart survey as an alternative source of information for the principal. The methodology proposes asking counterparts about attitudes toward some behaviors of agents, which are undesirable from the principal and benevolent counterpart perspective. The approach identifies the potential opportunism of counterparts based on the intensity with which they justify such behavior and provide unrealistic assessments of commonly known problems. This approach indirectly indicates the potential opportunism of the agent, which is linked with such counterparts. Further description is based on the paper Yakovlev et al. (2019).

## Opportunistic Behavior in Contractual Relations

Economic actors are assumed to be characterized by bounded rationality and may behave opportunistically. In the original transaction cost economics (TCE) literature, opportunism is defined as "self-interest seeking with guile" (Williamson 1975, p. 6). In his subsequent work, Williamson (1985, p. 47) describes guile as "lying, stealing, cheating, and calculated efforts to mislead, distort, disguise, obfuscate, or otherwise confuse." This view is further extended by Bergen et al. (1992), who declare that partners seek to maximize their own benefits, which leads to self-interested and opportunistic behavior. Therefore, partners will act opportunistically when it is profitable (John 1984) leading to higher transaction costs. In practice, opportunism may take various forms and includes a wide range of different behaviors: distortion of information, including overt behaviors

such as lying, cheating, and stealing, as well as more elusive behaviors such as misrepresenting information by failing to make full disclosure (Hawkins et al. 2008).

Opportunistic behavior is typical of various forms of contractual relations: business-to-business, labor, education, insurance services, etc. This concept has a highly contextual character and should be examined under the perspective of the context which occurs. In the context of public procurement, this chapter focuses on the practice of relational contracts as an area with a wider scope for opportunism. Repeated contractual relations are characterized by a higher level of trust between partners; lower transactional costs, both at the stage of contract conclusion and at delivery; and greater opportunity for prompt problem solution compared to one-time interactions.

At the same time, repeated interactions may be a consequence of deliberate manipulation aimed at narrowing the range of potential bidders. For example, the procurer could award new contracts to suppliers with a good reputation and exclude future cooperation with those who did not execute contracts in a proper way. The procurer may also tend to prevent the emergence of new bidders due to the existence of a well-developed mechanism of interaction with an incumbent supplier and reluctance to change it. This results in less competitive pressure on the supplier, decreasing its economic incentives and, as a consequence, leading to overpricing. Repeated contracts may also produce opportunities for corruptive conduct by their parties. Various corruptive arrangements lead to even greater overpricing, as the supplier needs to compensate for the kickback paid to the procurer for concluding the contract.

These effects are particularly obvious in cases of the procurement of homogeneous products. When procurement of products with inspectional quality can be verified at the time of delivery, prices over the market average may be an indicator of opportunism. However, in the case of complex goods and services, opposing effects are possible. In the case of the procurement of goods with a quality that is not verified at the time of delivery, relative overpricing can be related to the supplier's good reputation or a contract delivery guarantee as well as to the supplier's opportunistic behavior. Therefore, prices may be higher than the market average even with honest procurer behavior, e.g., if the supplier asks for compensation in return for the guaranteed high quality of the procured goods that has been confirmed during previous interactions.

Researchers traditionally consider opportunism a phenomenon that emerges during interactions between private agents. The specific feature of the public sector, including public procurement, is the principal-agent problem. The principal-agent problem is less acute in the private sector, as the principal is personified. The owner of a private firm generally disposes of sufficient opportunities to efficiently organize the monitoring of agents' activities. However, such opportunities become weaker in state-owned enterprises or public sector entities, where the owner is the state acting on behalf of society.

In addition to the complex nature of the procured product, another factor complicating the identification of dishonest conduct is an imperfect regulatory environment. This factor is particularly relevant in developing markets. Under conditions of stable and functional legal institutions, the principal can effectively control the activities of her agents by controlling compliance with the rules (due to their adequacy and feasibility). However, developing markets are characterized by excessive and contradictory regulation, pushing economic actors to the shadow sector on a mass scale (De Soto 1990; Djankov et al. 2002). A solution of the principal-agent problem is more difficult under such circumstances because, under inadequate regulation, even honest agents are forced to violate the rules. Consequently, the control and detection of agents acting dishonestly becomes complicated for the principal-procurer. Hence, there is a need to develop alternative approaches for the identification of potential opportunism.

## How Does One Identify Opportunistic Behavior in Repeated Interactions in the Public Procurement?

Most studies of opportunistic behavior in such repeated interactions are theoretical. A considerable

share of papers are devoted to modeling opportunism and its implications from the perspective of transaction cost theory (Chen et al. 2002) or game theory (Harbaugh and To 2014). Empirical studies of opportunistic behavior can be classified into two categories. One is based on contract data analysis (e.g., Crocker and Reynolds 1993; Lumineau and Quélin 2012). As a rule, access to such data is restricted, and analysis is complicated by the need to scrutinize the contents of contracts, conflict settlement mechanisms, etc. The second category is based on surveys and is the most commonly used method of assessing opportunistic behavior. The existing papers in the second category mainly analyze the factors of opportunism in private procurement.

Previous research has shown that the procurers themselves regarded the suppliers' readiness to deceive their counterparts for the sake of higher profits as one of the indicators of opportunism (Wang et al. 2012; Morgan et al. 2007; Mysen et al. 2011). All authors studied opportunism on the basis of procurers' surveys presuming that their responses were credible (The only exception is (Bhattacharya et al. 2015) who used the parallel questioning of procurers and suppliers to evaluate the factors of procurer opportunism.). However, procurers can also distort their assessments or deliberately evade answering sensitive questions. This spawns doubts as to the credibility of the obtained results and constitutes one of the limitations of the approach used in previous studies.

## Methodology that Identifies the Potential Opportunism

The participants in public procurement interactions include the principal, her agents, and suppliers (Fig. 1). By principal, the authors mean a high-level governmental body (for instance, a ministry); by agents, the authors mean subordinated public entities (for instance, hospitals and schools). Suppliers include different types of firms (A, B, and C), for which the authors are trying to identify differences in behavior patterns, comparing their responses to related blocks of questions of the questionnaire. Arrows between agents and suppliers show their repeated relations in public procurement (contracts).

Within the context of traditional interaction with agents, the principal, on the one hand, sets their task and, on the other hand, provides them with funding to perform their functions. At the same time, the principal is responsible for the final outputs. In addition to exercising the controlling function, the principal has direct responsibility for the agents' actions. As was already stated above, in a stable and functional regulatory environment, the principal acts on the basis of the information provided by her agents. By analyzing this information, she can detect inconsistencies and possible dishonest behavior. However, under rules that are inconsistent with reality and unfeasible for the agents, the principal cannot distinguish honest agents on the basis of available information.

**Opportunistic Behavior in Public Procurement, Fig. 1** Interaction of participants in public procurement

In this context, the authors propose an alternative method of identifying potential opportunism by conducting surveys of suppliers as a source of information for the principal. A comparison of responses to different questions on the questionnaire would help identify the types of suppliers (A, B, C) with different degrees of involvement in fraudulent actions. This method of analyzing suppliers' responses to different questions would help distinguish suppliers distorting information or evading questions from those who are telling the truth.

First, this approach enables the identification of groups of suppliers with unrealistic (overstated or understated) assessments and makes a more adequate estimation of the scope of the practice of predetermining the choice of suppliers. Second, proceeding from the findings of previous studies, according to which systematic information distortion is a sign of opportunism, this approach helps identify suppliers who are prone to opportunism (dashed line on Fig. 1, to the right). By following those suppliers' repeated interactions, the principal can identify agents that may be involved in corruptive practices (dashed line on Fig. 1, to the left).

## Conclusion

This chapter presents a methodological approach for detecting potential opportunism by counterparts that are linked with agents through contractual relations. Meanwhile, the chapter does not consider the situation of changing the rules by reforming the public procurement system. This is not a task for a single, even large, organization and should be addressed by the collective effort of many organizations or the government. The authors instead focus on what a principal should do in a situation in which the existing system of rules is inadequate, and she cannot change it.

In this case, the authors suggest using a counterpart survey as an alternative source of information for the principal. The methodology proposes to ask counterparts about the attitude to some undesirable behavior of the agent from the principal and benevolent counteragent perspective. The findings of previous studies show that the systematic distortion of information is one of the indicators of opportunism. Therefore, the authors can identify the potential opportunism of counterparts based on the intensity of their justification of such behavior along with unrealistic assessments of existing problems. By following those counterparts' contractual relations, the proposed approach allows to further indirectly indicate the potential opportunism of the agent related to these counterparts.

The practical implication is that this methodological approach makes it possible to take into account the objective heterogeneity of suppliers when developing measures to improve the public procurement system. Therefore, the presented methodology may be applied in other spheres of public administration, where public bodies or large state-owned enterprises interact with counterparts on a competitive base and are vulnerable to corruption and opportunistic behavior.

# Oppositional Power

Julian L. Garritzmann
Department of Political Science and Public Administration, University of Konstanz, Konstanz, Germany
Department of Political Science, University of Zurich, Zurich, Switzerland

## Synonyms

Opposition influence; Oppositional power; Oppositions' institutional opportunity structures; Parliamentary control power

## Definition

Oppositional power refers to the degree of influence of nongoverning parties or nongoverning members of parliament on the policy-making process.

## Introduction

In democracies, the focus of this entry, oppositional power refers to the degree of influence of nongoverning parties or nongoverning single members of parliament on the policy-making process. As Robert Dahl, one of the "founding fathers" of political science, noted already 50 years ago, the existence of an opposition can be regarded "as very nearly the most distinctive characteristic of democracy itself" (Dahl 1966: Preface xvi). Autocracies, in contrast, stand out by restricting, limiting, or repressing oppositions, inside and outside of parliament. Despite this crucial role of oppositions for democratic political systems, the influence of oppositions on the policy-making process, that is, oppositional power, has hardly been studied explicitly in political science and public policy.

How much power do oppositions have across the advanced democracies? This entry provides an overview on our (still relatively sparse) knowledge on the power of oppositions. It starts by theorizing on the (normative) importance of oppositions and their influence for democratic systems and then moves on to discussing existing studies, which have tried to measure oppositional power empirically. Two factors are particularly important here: the role of political institutions as opportunity structures for oppositions and the characteristics of the oppositional actors themselves. Both institutions and actor configurations affect oppositional power. The entry concludes by posing a number of hitherto unanswered questions that would deserve further scholarly attention and by discussing some important effects of oppositional power on relevant social, economic, and political phenomena such as party competition and voting behavior, satisfaction with government or democracy, or coalition formation processes.

## Why Oppositions and Their Power Matter

When we switch on the television or radio news in the evening and are informed about a new policy proposal by the governing parties, we are used to

also being informed about the opposition's point of view on this bill. Which aspects of the proposal will they criticize? And for which reasons? How would they have solved the addressed problems differently if they had been in power? As this example illustrates, the existence of a (parliamentary) opposition is a key defining element of democracies. We cannot imagine a democracy without parliamentary opposition, and if – as has recently been the case, for example, in Russia or Hungary – the oppositions are being restricted in their opportunities to freely communicate their positions, we begin questioning the quality of democracy in these countries.

Historically, the emergence of a parliamentary opposition is a relatively modern phenomenon. Historians have pointed out that its origin dates back to eighteenth-century Britain (Foord 1964). At this time, political power in Britain increasingly shifted from the king and his ministers to parliament. Parliament got to decide on more and more policy issues. As a consequence of this transition, the earlier dispute between the king and his ministers, on the one hand, and parliament, on the other hand, was moved into parliament itself: Within parliament, two groups formed – one governing, the other opposing. All parties hastened to emphasize that they were loyal to the king (this is where the prominent term "his majesty's loyal opposition" stems from), but started taking different positions on policies. In the aftermath, this British innovation of two parliamentary groups travelled around the world and became a key element of all democracies. One indicator for this British heritage can today still be found in the different words for "opposition" in the European languages: An etymological analysis shows that in all but very few European languages, the word "opposition" was adapted in one way or the other as a loan word (e.g., "Opposition" in German, *opposizione* in Italian, or *opozycja* in Polish).

Despite this crucial role of oppositions for democratic political systems, oppositions and their power have not been studied extensively in either the political science or the public policy literature. Robert Dahl, one of the "founding fathers" of political science, pointed this out already in 1966 in his important book *Political Oppositions in Western Democracies*. In this volume, Dahl tries to found the field of opposition research by offering six criteria to classify variation in oppositions across the advanced democracies that would deserve further inquiry:

1. The *cohesion* of the oppositional actor(s) (their number and internal coherence)
2. Their *competitiveness*, indicating "the way in which the gains and losses of political opponents in elections and in parliament are related" (Dahl 1966, p. 336)
3. The *setting* where government and opposition collide (e.g., parliament, elections, the street)
4. The opposition's *distinctiveness* (or *identifiability*), depicted on a continuum from a system in which the opposition is so conspicuous that we can speak of "*the* Opposition" to systems in which the difference between government and opposition is indistinguishable
5. The *goals*
6. The *strategies* of oppositions

With these criteria, Dahl pointed at crucial dimensions of oppositional power. Nonetheless, only very few studies have followed Dahl's early contribution and studied oppositions (cf. also Kaiser (2008) for a similar verdict). Political scientists have largely continued to focus on governments and their actions.

In order to get a more systematic understanding of oppositional power, it helps to distinguish two elements that shape the opposition's power: (a) characteristics of the *political institutions* in the respective country and (b) *characteristics of the oppositional actors* (cf. also Kaiser 2008; Garritzmann 2014). By now, it is a well-established consensus in political science that institutions structure political action (Hall and Taylor 1996). Institutions can thus empower oppositions to various degrees. At the same time, however, the power of oppositions is not fully determined by institutions but also depends significantly on how the opposition parties act within a given set of institutions. Consequently, oppositional power is a function of the institutional

setting and the respective actor characteristics. These elements are discussed in turn in the following.

## Oppositional Power Varies Across Political Institutions

First of all, the *institutional setting* of a political system affects oppositional power (Dahl refers to this as the "setting" where the government and the opposition collide). Studying this empirically in a comparative fashion, Kaiser (2008) and Garritzmann (2014) borrow a term from protest research and analyze political institutions as "opportunity structures" for parliamentary oppositions, as institutions offer opportunities to oppositions and enable them to act. Kaiser (2008) and Garritzmann (2014) distinguish two types of institutional opportunities: *intra-parliamentary* opportunities, that is, institutions within parliament such as committees or institutionalized parliamentary question times, and *extra-parliamentary* opportunities, that is, institutions outside parliament that opposition parties can use to exercise power, such as second chambers or appeals to constitutional courts.

### Intra-parliamentary Opportunities

How much power do oppositions have in parliament? Which institutions can opposition parties use to influence the policy-making process? The bulk of existing studies on legislatures and parliaments focuses on the institutional opportunities of parliament vis-à-vis government (e.g., Sieberer 2011) or on single members of parliaments' rights. It has hardly been studied yet how intra-parliamentary institutions affect oppositions as such.

Kaiser (2008), however, comparatively analyzed some classical Westminster democracies. The common wisdom for Westminster democracies in comparative politics is that oppositions are entirely powerless here as the government controls a majority and leaves little influence to oppositions. Kaiser shows, however, that a more nuanced analysis results in a different conclusion: "There is no such thing as a Westminster pattern of parliamentary opposition. [. . .] [We] find an astonishing variety of constellations" (Kaiser 2008, p. 36). In New Zealand and the UK, for example, oppositions can make use of an institutionalized parliamentary question time to confront the government and criticize them publicly, thereby offering them strong institutional opportunities to clearly and loudly speak out against the government.

Garritzmann (2014) expanded Kaiser's analysis for a broader set of countries (22 advanced democracies). He argues that institutions fall into two groups regarding oppositional power: some institutions, like the committee system, enable oppositions to *control* government and its policies. Other institutions, like parliamentary question times, enable oppositions to publicly criticize and to offer *alternatives* to the government's policies and its personnel. Garritzmann thus distinguishes two types of oppositional power: control power and power to present alternatives. He then goes on to analyze several institutions in detail (committee systems, oral question rights, written question rights, parliamentary question times, agenda-setting processes) and offers two indices to measure the two dimensions of opposition power: a "control power index" and an "alternative power index."

Using these measures, Garritzmann shows empirically that the advanced democracies fall into four groups: In the first group of countries, the institutional setting offers oppositions neither strong control powers nor strong powers to present alternatives; this is the case in southern Europe. Oppositions remain overall rather powerless.

In the second group of countries, the "consociational democracies" of the Netherlands, Belgium, and Austria, the institutional setting also does not empower oppositions much in terms of presenting alternatives; the oppositions do have strong powers, however, on the control dimension. In other words, oppositions in these countries can closely monitor and affect the policy-making process, but they lack strong opportunities to publicly criticize the government and to present alternatives to its course.

In the third set of countries, comprising Nordic Europe and Germany, the institutional setting offers both strong control powers and strong opportunities to present alternatives. In these countries, the opposition can draw back on a large variety of institutional tools to exercise influence and can be regarded as powerful.

In the fourth group of countries, finally, the institutional setting offers strong opportunities to present alternatives, but leaves no control power with the opposition. This is the case in the UK, Ireland, and other Westminster democracies. Here, oppositions can hardly detain government from what it wants to do, but they can blame the governing parties for each of their steps.

This finding, pointing out four different constellations of oppositional power, challenges the common wisdom that democracies cluster around two ideal points: a majoritarian and a consensus-oriented type (e.g., Lijphart 1999). In this vein, as will be emphasized in the conclusion below, looking at seemingly well-understood political phenomena from the perspective of oppositions and their power can considerably contribute to our understanding of politics. Taken together, both Kaiser's (2008) and Garritzmann's (2014) analyses show that the institutional setting in which oppositions operate in parliament has a huge impact on their power: Oppositional power crucially depends on the intra-parliamentary institutional opportunities that a political system offers.

### Extra-Parliamentary Opportunities

The second important set of political institutions that contribute to oppositional power lies outside parliament. In his by now classical book *Patterns of Democracy* (1999), Arend Lijphart conceives of these as "the second dimension." The first very important aspect is here whether the political systems are *bicameral*, that is, whether a *second parliamentary chamber* exists. This is, for example, the case in Australia, Germany, and Italy, but not in Sweden, Finland, or Portugal. In most bicameral systems, a different seat allocation system is in place for the second chamber than for the first chamber, with the result that the first and second chambers often differ in their political majorities (think, e.g., about the US House of Representatives and the US Senate). When a second chamber exists, this can offer a strong opportunity for the opposition to exercise control over the government. As an example, Kaiser (2008) demonstrated that whereas in Australia the opposition parties' power in parliament is rather weak, Australian opposition parties often still have a strong say in the policy-making process because Australia has a bicameral system with an extremely strong second chamber, which is often controlled by opposition parties. Miller and Stecker (2008) showed in a similar vein that opposition parties in the German *Bundestag* were more influential in the committees when they controlled a majority in the second chamber, the *Bundesrat*.

Another related example of an important extra-parliamentary institution that affects oppositional power is *federalism*. In federal systems, that is, in systems where power is constitutionally guaranteed to be separated across several levels of government, oppositional power is also affected by the lower, subnational governmental levels. This is so because federal governments not only face opposition within the national parliament but moreover potentially also from the subnational regions.

The third important extra-parliamentary institution affecting oppositional power is the possibility to *appeal to a constitutional court*. When the opposition has this opportunity, it enables them to credibly threaten that they might sue against certain government bills, thereby empowering them in the policy-making process. A government might accordingly adapt its proposals to the oppositions' ideas (to a certain degree) in anticipation to avoid such a procedure, which would also expose them to massive, unwanted publicity in the media. In this vein, Alec Stone Sweet (2000), Christoph Hönnige (2007), and others have demonstrated that the selection of judges for the constitutional court is a highly politicized process, as parties know about the role it may play in the policy-making process.

Still other sources of extra-parliamentary institutions adding to oppositional power can – among others – be *referenda and direct democracy*, *audits*, or even the presence of *ombudsmen*. Overall, these extra-parliamentary opportunities can

lead to a system of checks and balances. Exploring how these affect oppositional power in detail is a task for future research, as this has not been addressed systematically and comparatively yet.

In sum, both the intra-parliamentary and the extra-parliamentary institutional setting should be regarded as an opportunity structure for oppositions that affects opposition power, that is the degree of influence oppositions have on the policy-making process.

## Oppositional Power Is Affected by Oppositional Actors' Characteristics

The previous section outlined how and why the institutional setting of intra- and extra-parliamentary institutions crucially affects the opposition's power. The power of oppositions can, however, also vary within the very same institutional setting, as this section will argue and demonstrate. This is so because oppositional power is also affected by how the oppositional actors behave, that is, by how they make use of the institutional opportunities to exercise influence.

As discussed already above, some of the key elements worked out by Dahl's (1966) classical book point at the importance of analyzing characteristics of the opposition itself. Dahl pointed to the "cohesion," the "goals," and the "strategies" of oppositions.

The *cohesion* of the opposition can have a huge impact on their overall power. Imagine that you are the governmental party and you could choose between three types of oppositions that you have to face: (a) a coherent bloc of opposition politicians who all have the same goal, that is, they agree among each other and disagree with your government; (b) an incoherent opposition in which several fractions hold different positions and argue among each other a lot; or, as a subtype of the latter, (c) an opposition that is split so widely that your government faces opposition "from two sides," that is, from the political left and the political right. Which of these would you prefer? Probably you would have a clear preference for the second case, as this will be a much weaker opponent. As this example illustrates, the coherence of the opposition can have huge effects for their power. When the opposition is internally estranged, they will be much less likely to powerfully attack the government and to present a convincing alternative that citizens could decide to vote for. In contrast, when they are internally coherent and respond to each step by the government with a coherent, critical response, the opposition will be a much more powerful foe.

Moreover, oppositional power also depends on the oppositions' goals and strategies. Opposition parties can aim to pursue a number of *goals*. They can, for example, be purely policy-maximizing (i.e., trying to establish their favored policies irrespective of whether this costs them votes or not and irrespective of whether this increases the likelihood to get into public office), they can be fully vote- or office-maximizing (only caring about getting into government, even if that implies giving up some of its policy ideals), or a mixture of both (Müller and Strøm 1999). Moreover, opposition parties could even propose anti-system positions, that is, opposing not only the governments' policies but the democratic political system as such.

Relatedly, oppositions can use several *strategies* (cf., e.g., Dahl 1966; Oberreuter 1975): They can *cooperate* with the government in order to at least partly influence policy outputs, they can *confront* the government with all means, or they could use a mixture of both strategies and decide on an ad hoc issue-specific basis. Depending on the respective goals and strategies and accordingly their behavior in parliament (and in the media and the public sphere), oppositional power can vary even within the very same institutional setting.

In addition to oppositions' coherence, goals, and strategies, the opposition's power also depends on their *personnel*, that is, the concrete politicians that exercise the oppositional role. When the opposition offers a clear alternative to the government in terms of personnel and makes very clear who would take over governmental responsibilities if they won the next elections (i.e., they would present a "shadow cabinet"), it is much more visible for the public what the

alternative to the government could look like. When, in contrast, a shadow cabinet is inexistent and oppositional action distributed across many members of parliament, the opposition is likely to have much less power, because the oppositional action is spread across a variety of actors and is less visible for the public. In this vein, Salmond (2004) demonstrated that the effects of oppositional leaders on public opinion can vary a lot, depending on the opposition parties' leader and action (e.g., during an institutionalized question time).

To illustrate how oppositional actors' characteristics can affect their power even within the very same institutional setting, consider Steinack's (2011) work. Analyzing parties in the Bavarian state parliament in detail, she showed that the oppositional parties, the Social Democrats (SPD) and the Greens (*Die Grünen*), behaved in fundamentally different ways in parliament, with the SPD adopting a much more cooperative style, whereas the Greens concentrated on direct and fundamental confrontation with the government. Both strategies had very different effects on the final policies, on people's vote decision, and on public opinion.

In sum, both the institutional setting within and outside parliament and characteristics of the respective oppositional actors affect oppositional power.

## Conclusion

The existence and proper functioning of an opposition can be regarded as a key and defining element of democracy (Dahl 1966). Oppositions (a) control the governing parties; they (b) criticize the governments' policies, methods, and personnel; and they (c) offer alternative policies, means to achieve these policies, and alternative governing personnel ("shadow cabinet") to the government so that voters have the option to change the government's course (Friedrich 1962). Despite this crucial role for political systems, oppositions have not been studied extensively in political science and public policy yet. Oppositional power, that is, the influence that nongoverning parties or nongoverning members of parliament exercise on the policy-making process, has been addressed only in a few existing studies.

This entry theorized on the (normative) importance of oppositional power for the (functioning of) democracies; distinguished different types of oppositional power (control power and power to present alternatives); pointed at a number of institutional factors inside and outside of parliament, as well as to actor characteristics that affect oppositional power; and discussed the few existing empirical studies trying to measure oppositional power empirically.

A number of crucial questions still remain open for future research. Consider two examples: First of all, the summarized studies on institutional opportunity structures mainly rely on cross-sectional data, that is, single time points. It has not been studied so far, whether and how these institutions change over time, and how and why they have evolved in the respective ways in the countries in the first place. Why, for example, do Austria, Germany, England, and Spain differ so considerably in their political institutional setup? Studying how institutional opportunities vary over time and how this has affected oppositional power could be a first endeavor for future research. Secondly, the analysis of institutions and actor characteristics has too often remained unconnected. For a fuller understanding of oppositional power, both should be brought together and studied simultaneously. Future research should aim to take this perspective.

In conclusion, it deserves pointing further out why oppositional power is relevant, that is, why it matters not only for the policy-making process itself but also for other important social, economic, and political outcomes. To illustrate this, consider two examples: For starters, oppositional power has large effects on party competition and voting behavior. It has been shown, for example, that voters punish and reward parties for their performance in government *and* opposition (see the literature on "economic voting"). This association, however, is likely to be at least moderated by the power of oppositions (to control governments and to present alternatives). When, for example, opposition parties have no institutional opportunities to affect policy-making and when voters know about this, they are unlikely to
